The application of the electric drive to sheet mills would appear to be preferable to the steam drive, because, in this type of mill, the variation of power is very great and very rapid. It is generally recognised that the operation of rolling mills constitutes the severest service to which the electric motor has ever been applied. The exceptional requirements, such as rapid and frequent acceleration, frequently recurring heavy loads, continuity of operation, and reckless handling, place this service in a class by itself. At the same time, modern development has been so rapid that a reliable motor can be obtained, and it is probable that in the near future the electric drive for rolling mills will be universally used. In the earlier installations of electric drive a high-speed three-phase motor was employed with a resistance inserted in the rotor circuit, so that the speed could be arranged to drop as the load came on and so allow the flywheel to give up its stored energy. The modern method is to use a slow-speed motor, together with a flywheel on the main motor shaft and drive direct without intermediate gearing, but with suitable coupling. A considerable saving has been effected by this change, as the loss of power by the rope drive and by the slip resistance is eliminated. The efficiency of the slow-speed motor can be gathered from the fact that generally this is constant within 1 or 2 per cent. at any load from  $\frac{1}{2}$  to 50 per cent. overload, and at a speed between the considerably wide limits which are usually set. By means of a special compound winding in the motor field the speed can also be arranged to drop, and the stored energy in the flywheel is utilised without any loss in power. It would also be well to mention that, as the overload capacity of a motor is three to four times that of a steam engine, greater uniformity in the speed of the rolls is possible, and consequently greater uniformity of thickness is obtained in the sheets.

The only real disadvantage which can be put forward against the electric drive is that the initial cost is high, but, on the other hand, its lower depreciation, better operation, and lower cost of maintenance should justify its installation. Several electrically driven sheet mills are working in this country, but unfortunately no reliable costs per ton have as yet been published. It would appear, however, by "reports," that considerable saving and greater output has been effected. The local conditions will prove a great factor in the working costs, as it is evident that much will depend on the rate at which power can

be obtained. The cost of power should not exceed 0.4d. per unit, and this figure should not be difficult to obtain. If a supply of exhaust steam is available, it is possible to reduce this cost to a much lower value by installing exhaust-steam turbine generator sets. At the same time, whatever local conditions may be, the electric drive would certainly appear to be more economical, because, whatever the steam consumption necessary per brake horse power delivered to the mill shaft may be, this steam could be utilised in our present-day highly efficient turbo-generators or gas engines to produce nearly 100 per cent. more power in electric units. American and Continental competitors have been much more progressive than those in this country in applying the electric drive to rolling mills. The usual scheme of power generation is by gas-engine driven generators, and in many cases waste gases from heating furnaces are utilised, so that the price per unit becomes almost ridiculously low. The Skinningrove Iron Co.'s recent electrical equipment is designed somewhat after this principle, and if actual costs per ton were available these would probably show enormous reductions over those with the old method of steam driving. With the electric drive the actual costs per ton would be obtained with great accuracy, whereas costs for steam-driven mills can only be approximate, as many factors have to be considered which can only be approximately measured. The electric meters will record the actual power required for all thicknesses and conditions of working, and it will be quite apparent that when a tabulated list of correct readings has been obtained, it will be possible for a driver, without any special skill, to turn out work of uniform quality. With the steam drive a skilled driver is absolutely necessary—even then breakdowns are frequent. In this respect the development of contactor gears, relays, &c., has made the electric control almost automatic.

For figures and examples of the saving derived per ton of sheets rolled by Continental manufacturers, "Morgan Morgan" should refer to the Papers by C. A. Ablett read before the Institution of Electrical Engineers, December 11th, 1911, and also before the Cleveland Institution of Engineers.

The second award (5s.) is given to "W. H.," who writes as follows:—

The question covers far too wide a range for any specific reasons or relative costs to be given, and the statements made below must only be taken as applying to ordinary general practice. There is no doubt as to general superiority of electrical drive over steam driving where sheet rolling mills are concerned. This is particularly the case if a supply of direct current is available, although for sheet rolling mills non-reversible motors are generally required, thus doing away with one advantage of the direct-current motor, namely, its easy reversibility. Where sheet rolling mills are concerned, slow speeds are almost universally required; thus, in order to obtain one of the great advantages of electrical drive, i.e., a high-speed motor, it is usual to use either spur or helical-gear drive or worm-gear drive. The last-mentioned allows a greater gear reduction, and consequently a large saving in space and weight, and, as a consequence, a saving in first cost of the electrical equipment as compared with the large, slow-speed steam engine. The over-all efficiency of the plant is considerably greater than for a steam-driven set, in which rope drive would probably be used. One of the reasons for this is the necessity for the use of very large ropes in order to take care of the sudden overloads. These large ropes produce very high losses, which, it may be mentioned, are being incurred the whole time the plant is running light, as well as when on load. Another point where electrical driving scores over slow-speed steam drive is the saving in the flywheel. This is, of course, a necessary fitment in order to store up the energy during periods of light load. It will be seen that when electrical drive is used the flywheel may be fitted on the motor shaft, which runs at a high speed, permitting, therefore, the use of much smaller and lighter flywheels. This gives a saving not only in cost, but in wear and tear. It may, of course, be argued that in a rolling mill where a large amount of waste heat is necessary, this could be utilised for heating the boilers for producing the steam necessary for the mill engines. But a satisfactory way of avoiding this waste is to instal gas-heated furnaces, and either take the electrical supply from the supply company, or in large mills put down a special generating plant for supplying current to the mill motors. Generally speaking, it would be necessary to purchase current at about 0.5 of a penny per unit from a supply company, in order to compete with a specially installed generating plant. It is quite impossible to lay down any figures for the comparative saving when using electrical drive as compared with steam drive, but there is undoubtedly a considerable one. It may be stated, however, that the cost per ton of finished product in a steel-sheet rolling mill would average 4s. 6d., taking power at  $\frac{1}{2}$ d. per unit. This may vary in specific cases to as low as 3s. per ton and as high as 5s. 6d. per ton.

### A RAPID WATER HEATER

WE illustrate here a new water heater which has been brought out by Simplex

"PLEXSIM" RAPID WATER HEATER.

Conduits, Ltd. (116 Charing Cross Road), to meet the requirements of the medical profession, dentists, chemists and others who require small quantities of hot water immediately. The article is substantially made in polished copper, and will give a supply of hot water immediately the switch is turned on; the temperature may be regulated by means of two sunk switches. The smallest size is of four pints capacity, and is equipped with two heating elements taking 300 and 600 watts respectively, controlled by separate switches, so that three different degrees of heat can be obtained. Larger sizes of capacities of two and five gallons can also be supplied. The latter is fitted with a ball valve to give a constant supply of hot water when required. It is designed for heat regulation. If the minimum switch is kept constantly "on," the contained water is gradually

heated up, so that very hot water can be drawn off immediately upon turning on the maximum switch.

The Company also inform us that they are introducing larger sizes of cast-iron electric ovens. These are fitted with the same special arrangement of elements as the smaller size, which has been very successful up to the present, in which the manner of fixing the elements ensures great rapidity in heating up, and absolutely uniform temperature at the top and the bottom of the oven.

### MOTOR CAR LIGHTING SWITCHES

A NEW series of automobile lighting switches has now been placed on the market by the British Thomson-Houston Co. (Mazda House, 77 Upper Thames Street, E.C.). These switches are of neat design and lasting construction, and are made in two types, for surface and flush fixing respectively, and in two finishes, polished brass and nickel. Other finishes can be supplied to order.

The switch is of the single-pole type, but two, three or four switches can be mounted side by side on one plate, so that any desired switching combination can be arranged. The

SURFACE AND FLUSH PATTERNS OF MOTOR-CAR LIGHTING SWITCHES.

surface-type switches have the ordinary tumbler movement, while the flush switches can be had either with tumbler or push-button movement. There is also a flush-locking switch which is operated by means of a key. The switch plates can be engraved in any desired way. Electrical contractors, motor-car builders and repairers are advised to write to the British Thomson-Houston Co., Ltd., Mazda House, 77 Upper Thames Street, E.C., for further information regarding these switches.

**Electrical Exhibition in Barcelona.**—It has been decided to hold an international electrical exhibition in Barcelona the end of next year or early in 1915.

**New Platinum Alloy.**—It is reported from America that a new platinum osmium alloy (0.5 to 10 per cent. osmium) has been produced with electrical and physical qualities equal to the platinum-iridium alloys, with a high percentage of iridium.

### SEMI-INDIRECT FITTINGS

WE have received from Simplex Conduits, Ltd., a catalogue of special designs of semi-indirect lighting fittings. The catalogue shows a comprehensive range of designs at all prices. Four different kinds of glass-ware are used in these. "Luxuro" is a pure white glass of satin finish, and the "Intaglio" glass is the same, but with designs embossed on the surface. Another particularly rich glass of ivory texture and colour is given the name "Onyx," and the "Alabaster" glass has great richness, with the same decorative markings as real alabaster, but more luminous and cleaner in use. Real alabaster bowls can also be quoted for where required. In most cases the fittings are also made suitable for use with the new inverted dish-type of holophane reflector for semi-indirect lighting.

"INTAGLIO" GLASS SEMI-INDIRECT FITTING.

**A New Australian Engineering Journal.**—We have received a copy of the first issue of a new monthly journal, entitled *The Commonwealth Engineer (Electric and Mechanical)*, which emanates from the same publishing offices as the *Mining and Engineering Review*. Among the contents of electrical interest is an illustrated article on the Auckland electric supply system, and some notes are also given on the Dunedin electricity undertaking. A Paper on the use of bare aluminium cables is also reprinted, with a report of the discussion. Other branches of engineering are equally well represented.

**Shipping, Engineering, and Machinery Exhibition.**—Arrangements are advancing for the Shipping, Engineering, and Machinery Exhibition which is to be held at Olympia, September 25th to October 17th, 1914. From a preliminary list of exhibitors we note that the following are among the firms who have already signified their intention to participate:—Babcock & Wilcox; the British Vacuum Cleaner Co.; the Electric Appliances Co., vacuum cleaners, fans, &c.; Feld Brothers & Co., electric lamps for marine purposes; Jacob, White & Co.; the James Keith & Blackman Co.; Marconi's Wireless Telegraph Co.; Pinchin, Johnson & Co.; the Sunderland Forge & Engineering Co.; W. C. Tackley & Co.; and Kelvin, Bottomley & Baird.

**The International Electrotechnical Commission.**—We have before us some further particulars of the meeting held in Berlin recently, which was referred to on page 512 of last week's *ELECTRICAL ENGINEERING*. It appears that the meeting was attended by some 70 delegates from 24 nations, five of which represented Spanish-speaking countries. Amongst several official Government delegates were those of Canada, India, and Great Britain. Mr. C. O. Mailloux, president of the American Institute of Electrical Engineers, presided over the unofficial meetings at which the work of the special committees was considered in detail, and the special committees were presided over by Dr. S. P. Thompson (Nomenclature), Dr. K. Strecker (Symbols), Mr. Huber-Stockar (Rating), and Dr. Zoelly (Prime Movers). We have already mentioned the subjects upon which agreement was arrived, and it may be interesting to add that the name of "Siemens" instead of the "mho" is to be put before the San Francisco Congress of the applications of electricity, to be held in 1915. The rating of electrical machinery gave rise to a prolonged discussion. It will be remembered that a special committee to study the subject was appointed at Turin in 1911, and that the committee has met in Paris and in Zürich. At Zürich certain limiting temperatures for modern insulating materials were put forward, and, broadly speaking, these have been adhered to. Much discussion centred round the question of the ambient or cooling air temperature. The distinction between the ideal rating which is useful for the purposes of comparison, and the available output which is dependent on the geographical position, came out most clearly in the debate. The majority of delegates were in favour of 40° C. as the limit of the cooling air temperature: three delegates, however, preferred 35° C. As it was not possible to arrive at a decision on this important point, involving, as it does, the fundamental question as to what temperature rise should be allowed in first-class modern electrical machinery, the Commission, rather than force a vote on a subject not yet ripe for decision, very wisely referred this particular point back to the National Committees for further consideration. It is hoped that a definite decision, satisfactory to all, may be arrived at in San Francisco in 1915.

## POTENTIAL TRANSFORMERS

WE illustrate here a new pattern of potential transformer which has just been put on the market by Messrs. A. Reyrolle & Co. (Hebburn-on-Tyne). These transformers are enclosed in iron cases suitable for oil filling. They will give an output of several times their rated capacity without over-heating. A special method of winding the coils is adopted to give immunity from breakdown. The insulating and other materials are carefully selected, and all coils are impregnated under vacuum. Every transformer is pressure-tested to three times its working pressure to earth, between phases, and windings, and, further, the coils are tested for insulation between turns by connecting their terminals to a circuit giving

OIL-IMMERSED POTENTIAL TRANSFORMER REMOVED FROM CASE.

three times the working pressure. The outputs are designed for a regulation of 1 per cent. from full load to no-load, the exact ratio occurring at half-load. The designs have been specially prepared to meet heavy service conditions on large power systems; a failure under these conditions would lead to serious consequences, and so the most scrupulous care is taken in the design and manufacture of all details.

## CONTINUOUS-CURRENT MOTOR STARTERS

ALTHOUGH the design of continuous-current motor starters now proceeds along well-defined lines, improvements are continually being effected, which, though of a minor nature, add materially to the satisfactory manner in which they work. When standard motor starters were first introduced, it was not anticipated that they would be exposed to such hard conditions as they are at the present moment. Special gear has therefore become necessary, and the General Electric Co. (67 Queen Victoria Street, E.C.) have perfected a type of starter capable of meeting the most stringent tests. Facilities are provided for the renewal and adjustment of parts subject to the most wear.

The whole series of five patterns, some of which are illustrated here, ranges from  $\frac{1}{4}$  h.p. to 100 h.p. for pressures up to 500 volts. A noteworthy feature in the small sizes is

FIG. 1.—SMALLER SIZES OF G.E.C. STARTERS.

the self-aligning contact block, which has been introduced in order that it can adapt itself to irregularities in the contacts which inevitably occur in practice through arcing. All the contacts are ground true in place on the face plate. Several outside improvements have also been included in the larger sizes. All the contacts are renewable from the front, so that should one require replacement, it is only necessary to lift two screws and it comes away bodily. In a running position, both the stops against which this short-circuiting brush rests are adjustable, so that if after considerable wear the brush exerts an uneven pressure on the two contacts, they may be readily adjusted. No-volt coils are usually set to release at 75 per cent. of the normal voltage, but users are sometimes mistaken in the exact voltage delivered, with the result that the no-volt coil may sometimes have an insufficient holding-on power. To meet this the no-volt coil is made detachable, and special instructions are sent out attached to each no-volt coil, so that, should it not hold on sufficiently well, the user is instructed how to take it out

for return. For making the main contact in the larger sizes of starters there are two brushes, one a carbon brush, and the other a brass or copper brush; the carbon brush taking any arc that may be formed, and so preserving the contacts. Other features are a self-aligning contact block,

FIG. 2.—LARGER STARTER WITH COVER REMOVED.

solid terminals for the incoming cable, and an overload trip adjustable over a wide range. These starters are built in the open, semi-closed, and totally enclosed cover patterns, the latter having a window through which the contacts may be inspected. A waterproof pattern can also be supplied.

## SUPERLUX GLASSWARE

A NEW series of glass diffusing reflectors has been introduced by the General Electric Co. (67 Queen Victoria Street, E.C.), which they claim to be a great advance on anything of the kind yet produced. The material used is a pure white glass of exceptional reflecting and diffusing qualities, and an absorption factor which we are told is no more than 5 per cent. over the effective angle of illumination. The inner or reflecting surface is of a dull, unpolished nature, which is produced in the manufacturing processes, and thus the surface is in perfect correlation to the glass, and is not affected in any way by cleaning or rubbing. The outer surface has a subdued polish, which, combined with its pure whiteness and texture, produces a most pleasing effect. The form of the reflectors has received as much attention as the material, and they are made in numerous sizes of the distributing and concentrating types, as well as in the form of globes and bowls of various designs. The company also list in the same catalogue a series of channelled steel and aluminium reflectors useful for industrial purposes, as well as corrugated glass mirror reflectors for special purposes.

**Electric Milking of Cows.**—In the course of an address to the Sanitary Inspectors' Congress last week at Llandudno, Sir J. Crichton-Browne spoke strongly in favour of electrical milking machines, which avoided the danger of infection, and could not act as typhoid carriers.

**Effect of Vibration on Magnetic Qualities of Iron.**—An article by E. Gumlich and W. Steinhaus, of the Physikalisch-Technische-Reichsanstalt, in the *Elektrotechnische Zeitschrift* of September 4th, describes a series of experiments made on bundles of recently annealed iron stampings to determine the effect of vibration. The bundles were tumbled about in a rotating zinc cylinder (between one and two falls per second) for one hundred hours continuously, and the magnetic qualities tested before and after this treatment. It was found that the permeability was reduced quite 10 per cent. and the hysteresis loss increased by varying percentages, depending on the constituency of the iron, the effect being similar to that of "ageing" by moderate continued heating. Such an effect would be produced, for example, by rail transport over long distances, or in the iron of traction motors subject to much vibration.

**Sheffield Fuel, Light, and Power Exhibition.**—This exhibition is to be held from October 24th to November 15th, and will include an interesting electrical section, a special feature of which will be demonstrations of cooking and heating. The following are among the intending exhibitors:—British Vacuum Cleaner Co. (boiler flue-cleaning plant); W. E. Burnand & Co. (power and electrical appliances); I. Coats & Co. (fittings, radiators, &c.); G. St. John Day, Ltd. (lamp holders, fittings, and radiators); E. Green & Son, Wakefield (economisers); Heenan & Froude; Lea Recorder Co.; Marsh Bros. (fittings); Steenhal & Boydell, Bradford (instruments); and T. W. Ward, Ltd. (motor and machine tools). It may be mentioned that the B.E.A.M.A. has granted permission to its members to exhibit.

## CATALOGUES, PAMPHLETS, &amp;c., RECEIVED

**ELECTRIC FIRES.**—A neat catalogue, in which particulars of a number of fine designs of glowing electric radiators introduced for the present season, has recently been issued by Belling & Co. (Derby Road, Edmonton, N.). The designs are suitable for halls, reception rooms, libraries, offices, bedrooms, &c., and each design is obtainable in several different finishes. The smallest size takes  $1\frac{1}{2}$  kw., and the largest size listed takes as much as ten. The improved fire-bars already described in our columns are used. Each bar can be wound for pressures up to 500 volts, so that failure of any bar does not affect the rest. We note also that a very liberal guarantee is given. In a test now in progress, the fire-bars are being run continuously face downwards, so that a very high temperature is reached, but no deterioration has so far been detected. The test has been in progress for over 2,800 hours.

**CARBON FILAMENT LAMPS.**—A new list of carbon filament lamps has been issued by the Stearn Electric Lamp Co., Ltd. (47 Victoria Street, Westminster, S.W.). Besides lamps of standard type for high and low pressures, there are listed lamps for laryngoscopic and ophthalmic purposes, as well as special lamps for various domestic and office purposes. A leaflet gives net trade prices for standard type lamps.

**PRIVATE TELEPHONE INSTALLATIONS.**—A list dealing with telephones and telephone switchboards for private installations has been issued in a convenient pocket size by Siemens Bros. & Co., Ltd. (Woolwich, S.E.). Included are magneto- and C.B. telephones, inter-communication telephones of the radial arm, and automatic replacement types, as well as water- and gas-tight telephones, cables, insulators, and accessories.

**MAZDA LAMPS.**—The British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), invites contractors to apply at once for folders, window cards, &c., for the Mazda advertising campaign, which will commence on Monday next. Included in the scheme is a bold window card embracing the "Mazda Arrow" pointing to an injunction to electric-light users to employ Mazda lamps.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**LIMIT SWITCHES.**—A sheet from George Ellison (Victoria Works, Warstone Lane, Birmingham) describes a substantial totally enclosed emergency switch of the self-resetting type for cranes, hoists, lifts, or for signalling purposes. The switch can be arranged to either open or close a circuit when it is operated.

**PORTABLE ELECTRIC TOOLS.**—The Adnil Electric Co., Ltd. (Adnil Building, Artillery Lane, E.C.), has issued a new list dealing with portable electric tools. The list is very comprehensive, and includes drills, grinders, drill posts, commutator grinding outfits, electro-magnetic chucks, &c., for direct, one, two, or three-phase circuits. The tools are well described and fully illustrated.

**ELECTRIC LIFTS.**—We have received a copy of a new edition of an attractive booklet entitled "Notes on Electric Lifts," which is being issued by Smith, Major & Stevens, Ltd. (Abbey Works, Northampton). This is fully illustrated, both as regards mechanism and control gear, and views of buildings, ships, &c., where the firm's lifts are installed. The descriptive notes on the different control systems and other arrangements are interesting reading.

**ARC LAMPS.**—Arc lamps, ornamental standards, raising and lowering gear, and other accessories, are well treated in a catalogue received from Johnson & Phillips, Ltd. (Charlton, S.E.). A considerable part of the publication is devoted to a consideration of the well-known "Metroflam" magazine flame arc lamp, and in connection with this a number of imposing photographs of lighting installations where these lamps are used are included. Another lamp dealt with is the "Orb" shuntless, single-enclosed arc.

**INSULATING MATERIAL.**—A leaflet from the Electrical Engineering and Equipment Co., Ltd. (Bank Buildings, 109-111 New Oxford-street, W.C.), brings to notice ambroin, margolit, isostabil, and other insulating materials.

**SCHOLEY'S MAGAZINE.**—The September issue of this little publication of Scholey and Co. (151 Queen Victoria Street, E.C.) contains a portrait of Mr. A. H. Stanley, managing director of the tube railways, and some interesting notes on flame arc lighting and automatic electric lifts.

**The Batti Wallahs.**—A visit is to be paid to the White Star liner *Olympic* on Saturday next. The party leaves Waterloo by the 10.15 a.m. train.

## ELECTRIC TRACTION NOTES

From the conflicting evidence given on Monday and Tuesday in the Board of Trade inquiry into the Aisgill disaster on the Midland Railway, it is still impossible to know whether gas was the cause of the serious fire which followed the collision, and whether, if all the coaches had been electrically lighted, there would have been less loss of life. It appears, however, from the statement made by Sir Guy Granet, the General Manager, that the use of gas lighting will not be discontinued unless this action is forced upon the directors by public opinion. The travelling public, however, will not be misled into thinking, from Sir Guy Granet's explanations, that the electric lighting of trains is still in the experimental stage, for they have been able to see examples of it for years on a large number of other steam-driven railways, and, in fact, on the Midland line itself. Another part of Sir Guy Granet's statement is interesting. No less than £100,000, he said, is being spent on improvements in the signalling system by introducing track circuits and electric locking devices in various places. Already there are 374 cases in which the line has been track-circuited between the home and starting signals, and the necessary locks and indicators provided, and 379 cases in which the interlocking block has been put in; the latter includes the provision of an electric lock on the starting signal to prevent the signalman from lowering it until the preceding train has cleared the home signal in advance. This, however, does nothing to meet the case of the driver taking no heed of the danger signals, and in this connection we may refer to a communication we have received from a correspondent, who refers us to the article which we published on the "Railophone" system of signalling in our issue of July 11th, 1913. In this system, it will be remembered, communication is maintained between the locomotive and the signal cabin by means of a coil carried on the locomotive and a wire laid parallel to the track. In the article an automatic train-stopping device was described, by means of which the brake was put on from the signal cabin in the event of the train overrunning the danger signal, and the working of this was demonstrated at some trials on the Stratford-on-Avon & Midland Junction Railway. Our correspondent also mentions a similar system which has been tried and extended on a section of the Berlin-Stettin line. In that case the trains run in a continuous inductive field, which is made to collapse suddenly when the train or locomotive approaches a distant signal. This causes a signal to be recorded in the cab of the locomotive. The signal is repeated almost immediately afterwards, so that the driver or the guard on the train has two signals warning him that he is approaching the distant signal, and if the distant signal is at danger the driver receives a third and prolonged warning, which may be visual or audible as desired, and this signal continues so long as the train travels beyond the distant signal if it is at danger. This does not embody the arrangement used in the "railophone" system, by which the train can actually be stopped if the danger signal is passed, but both methods are worthy of the attention of railway engineers at the present time when the confidence of the public has been so seriously disturbed.

A peculiar system of electric traction has been decided on for the electrification of the Norfolk & Western Railway in the mountainous Pocahontas district of America. A single-phase contact line will be used at 11,000 volts, 25 cycles, and the locomotives will carry a rotating phase splitting device fed at 750 volts for feeding four polyphase induction driving motors. At starting, the stators will be wound for 8 poles, and rotor resistance inserted, the motors being in cascade. A speed of 7 m.p.h. will then be obtained, and, by paralleling the motors, 14 m.p.h. will be possible, while, by changing the stator connections to give a 4-pole field, 28 m.p.h. will be an efficient running speed. Each motor will develop about 330 h.p. at 14 m.p.h., and as the trains will weigh about 3,250 tons when loaded with coal, and continuous grades up to 2 per cent. are encountered, four locomotives, two pulling and two pushing, will be used. These will be arranged for multiple unit operation in pairs, but there is to be no electrical connection between the two ends of the train. The motors will be geared in pairs through a jack shaft, crank, and side rods to the driving wheels, which are 62 in. diameter. The gear ratio is to be 18 to 85. No details of the phase splitting device are so far available, but the system was chosen on account of its lesser cost, when the slow speeds of rotation of the motors and limited room were

THE BEST IS THE  
CHEAPEST!

## SWITCHGEAR

IGRANIC ELECTRIC CO. LTD.  
LONDON

Works:  
BEDFORD

considered, while in addition regenerative braking can be effected. This is regarded as more important from the point of view of safety than from the possible saving in energy consumption. Twenty-six locomotives are to be built, and the first is expected to undergo its trials next spring. Some idea of the arduous nature of the road can be gathered from the fact that the trains are now worked by three Mallet locomotives, one pulling and two pushing. There is a badly ventilated tunnel 8,100 ft. long on the line.

According to the *Financier*, the Berlin municipal authorities have sanctioned the construction of a railway which will be partly elevated and partly underground, between the north-west and the south-west of the city. The total length of the line will be six miles, and the estimated cost is £4,500,000.

The Birmingham Tramways Committee has now completed the Hagley Road tramway, and a service has been commenced. This route is noteworthy for the many Parliamentary fights which the Birmingham Corporation had to carry on before powers were ultimately obtained. "First-class" cars are to be run on this route.

The gross profit on the Bradford Tramway system for the past year was £97,320, to which must be added £1,297 from the parcels department. The railless service, however, resulted in a deficit of £67. After payment of all capital charges, £32,921 remained to be transferred to reserve and renewals fund, after £9,000 had been contributed to the rates. It is interesting to note from the report that the tramway traffic expenses work out at 3'035d. per car mile, and for the railless service at 3'492d. An improved type of car is to be adopted on the latter.

The Bristol Corporation has decided to apply to Parliament from powers to acquire and work the tramway system, subject to the result of a poll of the city. This applies to the undertaking of the Bristol Tramways & Carriage Co. within the old city boundary, which the Corporation have the option of purchasing in 1915, except the Hanham Light Railway, which is not purchasable before 1928.

The scheme of the National Electric Construction Co. for extension of the Dewsbury tramways to Dewsbury Moor and Shaw Cross received the sanction of the Dewsbury Town Council last week, in spite of considerable opposition. An amendment favouring a railless scheme was defeated.

The Annual Report of the Sheffield Tramway system records a considerable increase in the traffic receipts, but a slight increase also in the expenses per car mile due to rises in price of coal and wages. The working expenses now stand at 6'176d. per car mile. The net balance after meeting capital charges was £77,296, of which, after large contributions to renewals and other funds, £30,234 remains for relief of rates.

The balance sheet of the United Electric Car Co. for the year to June 30th shows a net profit of £12,058, and a 5 per cent. dividend is declared on the ordinary shares.

A scheme is being considered for the conversion to electric traction of the Swansea & Mumbles Railway.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The report of the proceedings at a Preliminary International Conference held in London last June, "On the Further Protection of Submarine Telegraph Cables," has just been issued. It contains as appendices a description of the system of inspection of steam trawlers which is in force in this country for the purpose of lessening the number of cases of damage to cables, and recommendations as to the design of trawls. The resolutions passed at the Conference practically amount to a recommendation to the various Governments to institute systems of inspection more or less on the same lines. The report is in French—the language adopted at the Conference; copies may be obtained through any bookseller or direct from Messrs.

Wyman & Sons, Fetter Lane, E.C., for the modest sum of fourpence.

As stated on another page, several Papers relating to wireless telegraphy were read at the meeting of the British Association at Birmingham. Dr. W. H. Eccles, in a Paper before Section A, investigates how far the behaviour of the "loose contacts" used in wireless receivers is accounted for by purely thermal actions, including Joule, Peltier, and Thomson effects, as well as alterations of resistance and configuration. The cases of like and unlike substances are gone into, and equations are deduced which are sufficiently verified by experiment to lend support to this theory. Prof. G. W. O. Howe contributed a Paper to Section G on the nature and mode of propagation of electric waves. He considered first the waves existing in the space between the conductors of a single-phase transmission line, and then imagined these replaced by two parallel infinite discs. He then replaced one by the earth and the other by an inverted conducting cone of infinite extent to obtain similar waves to those employed in wireless telegraphy, and showed that contrary to the usually accepted view, the horizontal magnetic field and the vertical electric field due to the sending antenna are not 90° out of phase, but are approximately in phase, except in the immediate neighbourhood of the antenna. Dr. Eccles also read a Paper before this section on the propagation of electric waves over the globe. It has been agreed that diffraction alone cannot account for the transmission of signals a quarter way round the globe, and it has been suggested that the transmission of signals to great distances is successful either because the earth is not a perfect conductor or because the air is not a perfect dielectric. At night signals may travel to remarkable distances whatever their wave-length, and this suggests reflection rather than refraction; in the day signals of great wave-length travel best, which suggests refraction. The hypothesis introduced by the author, which attempts to account for this, is based on the assumption that the sun's rays ionise the atmosphere in such a way that the concentration of ions increase gradually as we ascend in the atmosphere. In this event, a ray started horizontally, say, will pursue a curved path with its concavity towards the earth; and thus, if the ionisation is great enough, an electric ray may follow and overtake the curvature of the earth. The quantitative side to the question is developed mathematically. The third Paper on this subject before Section G was by Dr. E. W. Marchant, who gave results of observations of the effect of atmospheric conditions on the strength of signals received at Liverpool from Paris. It appears that there is a maximum variation from 0.6 to 1.3 in the strength of the signals received on different days in the same month, the average strength of signal being assumed to be 1.1, and that the current received on a fine, clear night is about 1.7 times as strong as that received in the daytime. Observation has shown that rain in Paris always corresponds with a diminution in strength of received signals. In one case, with a wind of 6 metres per sec. velocity, blowing in a N.W. direction, the signal-strength fell to half its normal value. The most favourable condition for signalling appears to be a cloudy sky at both sending and receiving stations, the signals being weaker when the sky is clear or covered with light clouds. Rain at the receiving station appears to have a comparatively small influence on the strength of the received signals. The result of a set of special signals shows that the increase in strength of night signals occurs just after sunset, there being a sudden increase in strength of about 70 per cent. Signals are slightly stronger just after sunset than during normal night conditions.

In a brief discussion, which was taken part in by Dr. J. A. Fleming, F.R.S., Prof. Nicholson, Mr. Rivers Moore, and Prof. E. Wilson, certain differences of opinion were expressed regarding the theories put forward by Dr. Eccles and Prof. Howe. It was, however, generally agreed that the evidence upon which we have at present to work is too slight to justify any one worker being dogmatic. The one point agreed upon was the need for co-operation among wireless telegraph workers in recording atmospheric and other effects noticed by them during the course of their work. This course of action was strongly urged during the important discussion on wireless telegraphy which

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published September 11th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in *italics> indicate communicators of inventions from abroad.*

**16,782/12. Voltage Regulators.** A. POLLAK. A voltage regulator in which the dynamo voltage is regulated mainly by the stationary core of a coil which is connected in shunt to the main circuit while the movable core serves to operate the contacts of the switch in such a manner that the voltage is regulated to a value exceeding the normal until the movable core has reached a position of minimum distance from the stationary core. Special means are adopted to damp the oscillations of the armature. 1 figure.

**16,806/12. Motor Control.** B.T.-H. Co. (*G.E. Co., U.S.A.*). The system is for motors driving heavy machine tools, printing-presses, or other machinery, in which heavy parts have to be quickly stopped and reversed. The control is by a master switch and contactors, and means are provided for producing electrically a gradual dynamic braking effect in the motor when the moment of reversal is approached. 3 figures.

**19,000/12. Rectifiers.** A. R. BULLOCK. These rectifiers, which may be used for conversion from A.C. to D.C., or *vice versa*, are of the revolving commutator type with condensers connected between each commutator brush and each slip-ring, so that whenever a break occurs, a condenser is always across it. The condensers are connected in series to form a closed circuit. The A.C. circuit is connected at two points to this condenser circuit, and the D.C. circuit is connected at two points on opposite sides of the condenser circuit. 9 figures.

**19,113/12. Testing Conductivity of Liquids.** M. COPLAND. Apparatus for testing the conductivity of liquids in which movable electrodes are arranged to be controlled as to their position by the temperature of the liquid to be tested. 4 figures.

**19,467/12. Railway Signalling and Control.** H. VON KRAMER. This specification relates to a system of railway signalling or control having a live wire and a frame on the vehicle carrying a coil characterised by the fact that current is always flowing in the live wire maintaining an inductive connection with the frame. Signals are established by temporary absence of such inductive connection. 5 figures.

**23,775/12. Sealing in Lamp Leads.** B.T.-H. Co. (*G.E.C., U.S.A.*). The leading-in wires are provided with a coating of metal, the oxide of which is soluble in the surrounding glass at a relatively low temperature, the compound wire having substantially the same coefficient of expansion as the glass. 2 figures.

**26,597/12. Voltage Regulator.** B.T.-H. Co. and A. H. WATSON. Improvements in the Tirrill regulator are given with the object of increasing its range of regulation. An additional separately excited winding is provided on the main solenoid of the regulator. 1 figure.

**27,874/12. Isolating Switches.** SIEMENS BROTHERS DYNAMO WORKS and R. A. R. BOLTON. In order to prevent liability of these switches to come out on overload by the electromagnetic forces due to the current itself, the switches are so constructed with right-angle bends in the conductors to them that the direction of these forces is such as to hold the switch closed and not to open it. 3 figures.

**2,238/13. Variable Condensers.** A. E. WATKINS. These condensers are made with movable semicircular metallic plates, each moulded in or encased by a disc of non-conducting material. 2 figures.

**3,162/13. Metal Filaments.** WESTINGHOUSE METALLFÄDEN GLÖHLAMPENFABRIK. This specification protects a method of making tungsten or molybdenum alloyed filaments by the mechanical treatment of alloys containing suitable proportions of one or more auxiliary ductile metals, such as nickel, copper, or iron, removing these auxiliary metals after the ingot has been mechanically worked to render it sufficiently tough, and further working the remaining pure metal by hammering, rolling, or drawing.

**14,433/13. Incandescent Lamp Manufacture.** A.E.G. In this specification is described a machine for fusing holder wires into the supporting frame having wire-gripping devices arranged radially round a stationary support, and a fusing in chamber or mould against or into which the fused stem of the filament-

supporting frame is pressed so that the wires become imbedded in the stem. 3 figures.

**15,502/13. Series System.** R. FRANZ. A system of running lamps or apparatus in series is described. A substitutional resistance is inserted in series with the whole circuit. During normal action this is put out of action by a shunt of comparatively low resistance, which, upon failure of any one lamp, which can be readily detected by testing, the shunt can be placed across the testing terminals of the lamp to restore the main circuit. These contacts can be collected together to a multiple switch or plug board. 3 figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** MARKS (*Deutsche Beck-Bogenlampen Ges.*) 12,592/12.

**Distributing Systems:** B.T.-H. Co. and WEDMORE, 6,807/13.

**Dynamos, Motors, and Transformers:** THOMPSON (*Splitdorf Electrical Co.*) [Magnet generator] 26,323/12; SIEMENS BROTHERS' DYNAMO WORKS (*Siemens Schuckertwerke*) [Commutators] 6,648/13.

**Heating and Cooking:** KERCHER [Cookers] 19,754 and 19,771/12; MANN [Cooking utensils] 4,479/13.

**Instruments and Meters:** HOLDEN and CHAMBERLAIN & HOOKHAM [Meters] 19,118/12.

**Switchgear, Fuses and Fittings:** B.T.-H. Co. (*A.E.G.*) [Oil switches] 148/13; CLEMENS and MONARCH REFILLABLE FUSE Co. [Refillable fuses] 3,574/13; SCHUCHARDT [Plug contacts] 7,243/13.

**Telephony and Telegraphy:** GRAHAME-WHITE and FOTHERGILL [Production of electric power for wireless telegraphy on aeroplanes] 16,992/12; AUTOMATIC TELEPHONE MANUFACTURING Co. (*Automatic Electric Co.*) [Telephone systems] 19,251, 19,252, and 19,254/12; CONNER and KAHL [Telephone apparatus] 24,089/12; LOEWENSTEIN [Telephone mouthpiece guards] 3,387/13; SCHOT [Telegraphic transmission] 13,089/13.

**Traction:** DAWSON and BUCKHAM [Signalling] 19,585/12; CROSS [Electric road vehicles] 19,825/12; STRAITON [Trolley points] 24,372/12.

**Miscellaneous:** FRIEDMAN and FRIEDMAN [Electrically wound clocks] 19,429/12; TAYLOR and PINNEY [Fixing fittings, &c., to concrete] 19,921/12; HARTMANN & BRAUN [Portable lamps] 21,917/12; CAREY and R. WAYGOOD & Co. [Vacuum cleaners] 26,660/12; GRIGSBY and CAMPBELL, 27,396/12; MÜLLER [Insulators] 27,738/12; BICKLEY [Advertising devices] 29,881/12; GRAHAM [Electromagnetic diaphragm horns] 313/13; SCHANZENBACH and KNAFF [Globes and reflectors] 992/13; REID [Electric clocks] 1,243/13; BALDWIN [Miners' safety lamps] 3,115/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Electrometallurgy and Electrochemistry:** SCHOTT & GEN [Electrodes for electrolysis] 17,759/13.

**Incandescent Lamps:** SCHALLER, 1,804/13.

**Switchgear:** BROWN, BOVERI ET CIE [High-tension switches] 17,583/13.

**Traction:** BROOKS [Railway and tramway trucks] 17,087/13.

### Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** VERITY'S, LTD. [Arc-lamp suspension] 10,816/05.

**Dynamos, Motors and Transformers:** H. H. LAKE (*G.E. Co., U.S.A.*) [Turbo-alternator field magnets] 11,831/02; E. ARNOLD and J. L. LA COUR [Single-phase motors] 10,830/05; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Control of induction motors] 12,497/06; J. E. L. BARNES (*M. Breslau*) [Alternators and rotary converters] 11,558/08; A.E.G. [Single-phase motors] 11,633/08.

**Switchgear, Fuses and Fittings:** O. BAKER [Switches] 27,168/08.

**Telephony and Telegraphy:** J. HAAR [Printing telegraphs] 12,585/07.

**Traction:** W. FAIRWEATHER (*Electrical Devices Co., U.S.A.*) [Controller regulator] 12,477/06.

**Miscellaneous:** BROWN, BOVERI ET CIE [Combined turbine and electric drive for ships] 10,482/05.

took place at the Dundee meeting last year. Since then the Committee appointed as the result of that meeting has got to work, and hopes to publish a scheme of this character in the course of the next few months. In the meantime, an effort was made by the Post Office to obtain such information from its operators in various parts of the country, but although a large amount of information was obtained, the exigencies of the commercial work of the stations interfered so greatly with the recording of such effects that it is not felt that the results would be of much value if published. The chief aim of the Committee seems to be to enlist the aid of amateurs, and it is probable that in the course of another year much valuable information will have been accumulated. Dr. W. H. Eccles is acting as secretary to the Radiotelegraphic Committee.

During the meeting a report was submitted by the Committee on Radiotelegraphic Investigations. This Committee has come to the conclusion that the most urgent and profitable work they could promote was the investigation of the influence of sunrise and sunset, of daylight and darkness, and of meteorological conditions, on the propagation of electric waves over long distances, and the origin and the laws of "strays"—i.e., natural electric waves. In order to promote the necessary widespread observations, the Committee propose to draw up a simple scheme of instructions which will be circulated to operators, including directions for simultaneous observations of the strength of the time-signals, and the average strength and frequency of strays. The observations would subsequently be classified and reduced by this Committee, who have resolved to apply for a grant of £200 to enable the work to be started in a thorough manner.

According to the *Financial Times*, Marconi's Wireless Telegraph Co. is negotiating for the acquisition of the patent rights relating to the Goldschmidt system.

The strike of Italian Marconi operators at Genoa has been settled, and the men have returned to work.

Radiotelegraphic communication between Cataldo (Bari) and Antivari was suspended. On the 4th inst. the Panama Co.'s cables between Puerto Rico and St. Thomas and St. Croix became interrupted, and were repaired on the 9th. For the time being messages were transmitted via the lines of the French Cable Co.—Owing to a partial breakdown of the land lines between Puerto Plata and San Domingo, traffic for the latter place, Curaçao, Venezuela, is subject to delay.

## LOCAL NOTES

**Ballyconnell (Ireland): Electricity Supply.**—An inquiry was held on Wednesday last into the application of the Bawnboy R.D.C. for powers to carry through a scheme for the lighting by electricity of the town of Ballyconnell.

**Bexhill: Cooking Tariff.**—The charge for current for heating and cooking is now 2d. per unit up to 800 units and 1½d. afterwards.

**Burton: Electricity Accounts.**—A net surplus of £1,189 has resulted from the year's working of the electricity undertaking, of which £1,000 has been contributed to the rates and the remainder carried to renewals fund. The figure is slightly less than that for the previous year, on account of the higher price of coal.

**Carlisle: Electricity Profits.**—It has been decided that the whole of the profits of £1,509 be devoted to relief of rates. The Electricity Committee's proposal to add £500 to the reserve fund was defeated.

**Eastwood (Notts): Street Lighting.**—Some inconvenience is being caused by the main thoroughfare being in darkness, due, it is said, to delay in signing an agreement with the Notts & Derby Electric Power Co. The date now fixed for commencement of supply is September 21st.

**Hull: Extension of Supply Area.**—It is proposed to apply for an electric lighting provisional order for the district of Sutton.

**Launceston: Electricity Accounts.**—The first annual report of the Launceston & District Electric Supply Co. records revenue of £536 and expenditure of £534.

**Llanidloes: Street Lighting.**—Following a dispute with the gas company, on account of which the streets remained unlighted for fifteen days, electric street lighting is to be adopted at the same price.

**Perth: Electricity Accounts.**—The net profit on the year's working of the electricity undertaking is £237, of which £230 will be placed to reserve. An increase is to be made in the price of current supplied to the tramways.

**Portrush: Electric Lighting.**—A site has been purchased by the Council for an electric lighting station.

**Sturry (Kent): Supply Scheme.**—A scheme is being considered for electric supply to Sturry, Fordwich, Westbere and Broad Oak, in the neighbourhood of Canterbury, from water-driven generating plant at the Black Mill, Sturry. Overhead transmission at 240 volts is proposed.

**Truro: Supply Scheme.**—The whole electric supply scheme now under consideration is to be submitted to the ratepayers, partly in view of the fact that a more expensive site for the generating station is now proposed.

**Wishaw: Electric Light Undertaking.**—A small profit has been made for the first time on the electric light undertaking. The gross profit represented 8½ per cent. on the capital expended, and a net profit of £53 remained after meeting capital charges.

**Yeovil: Electricity Supply.**—Mr. E. W. Petter has intimated his intention to apply to the Board of Trade for a Provisional Order for the supply of this district.

**York: Extension of Supply Area.**—Application is to be made to the Board of Trade for an Order authorising the supply of electricity in a large number of rural district areas outside the city.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Australia.**—20,000-volt switchgear, low-tension switchgear and accessories for power station and substations to be constructed for the Melbourne railways. Consulting Engineers, Merz & McLellan, 32 Victoria St., S.W. (See an advertisement on another page.)

**Carlisle.**—Application is to be made to the Local Government Board for sanction to a loan of £4,300 for high-tension apparatus.

**Harrogate.**—It has been resolved to apply to the Local Government Board for permission to borrow a further £2,000 for cable extensions and £500 for transformers for lighting purposes.

**Heywood.**—A loan of £11,750 is to be applied for in connection with cables, buildings, and plant required for the bulk-supply scheme from the Bury Corporation.

**London: Hammersmith.**—Tenders are invited for a 125-h.p. A.C. motor by September 24th. (See an advertisement.)

**Oldham.**—A Local Government Board inquiry was held last week regarding an application for a loan of £30,000 for plant extensions which would enable the Corporation to supply power to three cotton mills and a workshop.

**Riga.**—A large expenditure is contemplated upon extensions at the electricity works.

**Salford.**—The Electricity Department invite tenders by September 29th for a compound air compressor. Particulars from Borough Electrical Engineer, Frederick Road, Pendleton.

### Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

**Dartford.**—Public Library.

**Doncaster.**—Technical school.

**Ealing.**—A scheme for enlarging the Town Hall has been sanctioned by the Local Government Board.

**Huddersfield.**—Isolation hospital at Crosland Moor.

**Jarrow.**—New police station.

**Lossiemouth.**—New Masonic Hall.

**Oldham.**—New school.

**Preston.**—Nurses' home at Fulwood Workhouse.

## THE RECORD ELECTRICAL Co., Ltd.

LONDON OFFICE:  
CAXTON HOUSE,

Altrincham.

**Worcester.**—New County offices.  
**Yarmouth.**—Picture palace in Regent Road.

### Miscellaneous

**Adelaide (Australia).**—The Postmaster-General invites tenders by November 12th for a trunk line switchboard, &c. Local representation necessary. Particulars from Commercial Intelligence Branch, Board of Trade.

**Australia.**—Tenders are invited by the Victorian Railway Commissioners for a haulage engine and 200-h.p. motor and equipment for the State coal mine. Particulars from Commercial Intelligence Branch of the Board of Trade.

**Melbourne (Australia).**—Tenders are invited by October 14th for 1,000 cable distributing boxes by the Postmaster-General. Local representation necessary. Particulars from Commercial Intelligence Branch, Board of Trade.

### APPOINTMENTS AND PERSONAL NOTES

Mr. W. J. Rendell Baker, Electrical Engineer to the Malvern U.D.C., has been appointed to a similar position at Mansfield.

Mr. Victor Broadbent, of Messrs. T. W. Broadbent, Ltd., Electrical Engineers, Huddersfield, has been presented with an electric clock by the employees, on the occasion of his wedding.

Mr. R. W. Willis, Assistant Electrical and Mechanical Engineer in the Swindon Electricity Department, has resigned. A successor is to be advertised for at a salary of £150, rising to £180 per annum.

A vacancy occurs for an apprentice in a manufacturing works in France. (See an advertisement on another page.)

An electrical engineer capable of designing electric lighting dynamos for motor-cars is required. (See an advertisement on another page.)

In consequence of the resignation of Mr. B. Sanky, who is taking up an appointment at Port Elizabeth, South Africa, there is a vacancy for a borough electrical engineer at Whitehaven.

Jointer required by British Insulated & Helsby Cables, Ltd., for paper-insulated cables. (See an advertisement on another page.)

An assistant electrical engineer is required for the Indian State Railways (Oudh & Rohilkund Railway). Director-General of Stores, India Office, S.W. October 4th.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £77 10s. to £78. (Last week, £77 5s. to £77 15s.)

**Osram Lamps in a Fire.**—Further evidence of the strength of Osram drawn-wire lamps is supplied by the fact that in a recent fire in South Shields the Osrams in the outside lamps were not damaged, although the three shops involved were gutted, and the heat caused the opal globes to burst, while molten lead and a burning sun-blind fell on the fittings.

**Boiler-tube Treatment.**—Mr. Sherard Cowper-Coles has granted a licence to the British Mannesmann Tube Co. for ferro-zincing or ironising boiler tubes to prevent pitting or corrosion. They are erecting a plant for the purpose at their works at Landore. The process consists of coating the tubes with a thin layer of pure iron which may or may not be afterwards coated with zinc. The coating of pure iron is found to be very inert to chemical action.

**Tramway Supplies.**—The Electrical Engineering & Equipment Co., Ltd. (Bank Buildings, 109-114 New Oxford Street, W.C.), have secured the sole selling rights in this country for electric tramway and railway equipments formerly sold by the Via Co., including overhead line material, poles, rail bonds, and automatic signalling systems.

**Metal Filament Lamps.**—The Searn Electric Lamp Co., Ltd. (47 Victoria Street, Westminster, S.W.), announces that the list prices of "Leuconium" lamps, which are claimed to be at least as strong as any tungsten lamps now on the market, are subject to an increased discount to the trade.

**Canadian Agency.**—H.M. Trade Commissioner for Canada reports that an agent in Westmount desires to secure the representation of manufacturers in the United Kingdom of electrical appliances, supplies, and specialities.

### COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Victoria Falls & Transvaal Power Co.**—The report for 1912 records an increase of revenue over that of the preceding year of £123,286, resulting in a profit of £446,380, in addition to the £45,744 brought forward. This increase is in spite of considerable capital being unproductive, due to constructional work being in progress, and of reductions in the price charged for power. The dividend is at the rate of 6 per cent., with £96,787 carried forward. There are continued increases in the demand for power, and the Vereeniging Power Station now runs with great reliability, the earlier transmission line troubles having been got over. Contracts for further plant aggregating 90,000 h.p. have been entered into.

**Yorkshire Electric Power Co.**—At the half-yearly meeting yesterday it was mentioned that the revenue for the half year, which in 1912 was £20,357, had this half year amounted to £30,132, an increase at the rate of 48 per cent. In spite of high prices of coal, the accounts show a profit of £6,971 for the half year. This, after payment of £3,307, the dividend on the preference shares, will leave £4,308 to carry forward. The waste-heat station at Barugh is now practically completed. The first installation there is a 2,000-kw. turbine, but increasing demands for supply have compelled the directors to place a further order for a 3,000-kw. turbine.

### NEW COMPANIES

**CLONES ELECTRIC LIGHT & POWER.**—Capital of £2,000, divided into 2,000 shares of £1 each.

**ATMOSPHERIC NITRATES (KILBURN SCOTT PATENTS).**—Capital, £12,600. First directors, E. K. Scott, R. McDougall, F. Howles, and S. McDougall. Registered by T. T. Hull and Son, 22 Chancery Lane.

**I.L. SYNDICATE.**—Electrical Engineers, 34-36 Gresham Street, E.C. Capital, £2,600.

**ELECTRIC MOTOR & STOVE HIRING CO.**—Capital, £5,000. First directors, J. C. B., E. J., H. S., and E. C. Ingleby, Leeds.

**LIVERPOOL ELECTRIC WELDING CO.,** 17 Water Street, Liverpool. Capital, £1,000. Private company. First directors, W. A. M. Wacksmuth, E. Jones, and H. Woods.

"The Central."—The September issue of this journal contains, in addition to the usual college and old students' notes, an article on a recent cable-laying expedition by Mr. B. S. Lion. Some interesting notes on the Leclanche battery are contributed by Mr. Maurice Solomon, and the Exchange Telegraph Company's news distribution system is described by Mr. Clifford Higgins.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

## SUMMARY

SOME notes on the arrangements for the next session and other matters relating to the Universities and Technical Colleges are given. (Page 536.)

IMPORTANT reductions have been made in the prices of metal filament lamps. (Page 536.)

OUR "ELECTRICAL ENGINEERING Literary Section" contains a list of new publications, reviews of a number of technical books, and gives a selected list of recommended works on all branches of electrical engineering. (Page 537.)

A HOME OFFICE Report has been issued on the fatal explosion which took place in connection with a Diesel engine last summer at Bray. (Page 543.)

THE committee appointed by the I.M.E.A. to encourage the use of electric vehicles has issued a statement regarding the directions in which its work will lie. (Page 543.)

AN interesting example of economies effected by electric power applications is presented in the scheme recently carried out at the works of the Salt Union, where large quantities of steam required for the evaporators are utilised also for power production, so that not only can the whole pumping plant and other machinery be driven electrically, but power can be supplied to outside consumers as well. (Page 544.)

THE ventilation of a chamber containing transformers is dealt with in our Questions and Answers columns. (Page 545.)

A SIMPLE and efficient rotary air-pump system for condensing plant in which a minimum of space is required is described. (Page 545.)

A NEW insulated terminal is described on page 546.

THE scheme of the proposed Channel tunnel outlined at the Franco-British Travel Union this week, included a description of how electric locomotives would replace at Dover the steam locomotives which at present haul the trains from London. (Page 547.)

A NEW four-core telegraph cable is being laid between Mundesley (Norfolk) and Emden in Germany, a distance of 240 nauts.—No confirmation is obtainable of the rumours that the Marconi Company contemplates increasing its capital.—Results are given of a comparison of the different types of Leclanche cells in which it is shown that the simple porous pot type gives the highest efficiency. (Page 547.)

THE Patent Office published specifications last Thursday dealing with D.C. motor meters, in which one brush and a mercury contact is used, by S. H. Holden and Chamberlain & Hookham, and two dealing with cooking utensils by A. J. Kercher and J. Mann respectively. A design of reflector or globe after the fashion of a venetian blind in which the light source is hidden has been protected by G. Schanzenbach and C. Knapp. (Page 548.)

THE electric lighting of all the streets in Rawtenstall is to be considered.—Manchester electrical workers are agitating for higher wages.—A scheme for working a refuse destructor with the Rothsay electricity works has been prepared.—Definite terms have been placed before the Stirling Corporation for the purchase of their electricity undertaking.—The Lancashire Power Co. has inaugurated supply at Tyldesley. (Page 549.)

ROTARY converters are required at Salford; L. T. feeder cable at Walthamstow; Diesel engine generating set at Worthing; a 250-kw. generating set by the Preston Guardians; a 6,600-volt overhead transmission line at Keighley.—An expenditure of £16,000 is contemplated at Grimsby, £7,500 at Carlisle, £4,000 at Littleborough, and £6,700 at Wigan.—A 15-ton electric crane is required by the Victorian Railway Commissioners, and cables, single-phase transformers, and incandescent lamps by the Melbourne Electric Supply Committee.—Switchgear is required at Wellington (N.Z.). (Page 549.)

THE capital reorganisation scheme of the British Westinghouse Co., which has now been placed before its shareholders, consists of a reduction in the capital of £725,000.—Satisfactory progress is reported by the reconstructed Crompton Company. (Page 550.)

## UNIVERSITY AND TECHNICAL COLLEGE ANNOUNCEMENTS

THE Calendar of Armstrong College, University of Durham (Newcastle-on-Tyne), shows that, in addition to the day courses, which commence next Monday, leading to a degree or diploma in one or other branch of engineering, evening classes in various subjects connected with the electrical engineering profession are held. Besides electricity and magnetism and general electrical engineering, there is a special weekly class dealing with wireless telegraphy. There are also classes on Saturdays embracing physics, mechanics, &c., and a complete course for miners at a reduced fee. The whole theoretical course for a Colliery Manager's Certificate is covered. A course on similar lines for colliery engineers, enginewrights, apprentices, &c., is also conducted. The former course extends over three winter sessions, and involves attendance from 3 to 6 p.m. for twenty-four Saturday afternoons each session. In the second case the attendances required are as above, except that they are of two hours' duration only. Dr. W. M. Thornton is Head of the electrical department.

The South Wales and Monmouthshire School of Mines (Treforest), which has been established to provide instruction of an advanced and practical character for training all grades of colliery officials. It is associated with a large number of collieries in the immediate neighbourhood. The courses of instruction comprise: (1) A three-years' full-time mining course; (2) A part-time day course for four years of one day of eight hours per week for mine managers, mechanics, electricians, and chemists, &c.; (3) Special courses in mining engineering, including the electrical equipment of collieries, and (4) a special course for surface foremen. The first term commences on October 8th. The Secretary is Mr. H. M. Ingledew (4 Mount Stuart Square, Cardiff).

A popular lecture will be given by Mr. F. H. Taylor on "Light—Ancient and Modern," in the science lecture theatre of the Willesden Polytechnic, on Wednesday, October 1st, at 6 p.m. Tickets may be had on application at the office of the Polytechnic, Priory Park Road, Kilburn, N.W.

**Miniature Rifle Clubs' Contest.**—The Siemens Dalston Works Miniature Rifle Club recently met the Western Electric Co.'s Rifle Club on their open-air range at Plumstead. The result was a win for the Siemens team. The average score was 89.5, while the total was 537 out of a possible 600.

**Protection against Corrosion.**—Lead, Ltd. (1 and 2 Old Pye Street, Westminster, S.W.), have acquired from Mr. Sherard Cowper-Coles the sole right for the coating of iron and steel by an electrolytic process. Lead by this process can be deposited economically up to a thickness of  $\frac{1}{16}$  in. This process is also suitable for treating earthenware, wood and ornamental ironwork. The cost is said to be less than hot galvanising when equal weights of metal are considered. A plant has been erected in London.

**Motor Hiring.**—A Company named the Electric Motor & Stove Hiring Co. (Elland Road, Leeds) has been formed to deal with the business of letting out motors in Leeds. The motors hired out will be of Leeds manufacture. It will be remembered that a motor hiring scheme was before the City Council last year, but was not proceeded with.

**Fire Brigade Tournament.**—At the Annual Tournament of the London Private Fire Brigade Association, the Osram Lamp Works brigade won the second prize for the four-men drill, the third prize for the three-men drill, and the Geelong challenge cup, and were placed third among twenty-three competitors for the championship of the Association.

**Metal Filament Lamps.**—Pope's Electric Lamp Co., Ltd. (Hythe Road, Willesden, N.W.), inform us that in the course of a test of their "Elasta" wire lamps by a Corporation, a group of 240-volt 50-c.p. lamps, taken at random from stock, were run for 2,512 hours. When taken out of circuit they were all intact, and giving an average of 41.79 c.p., with an average consumption of 1.5 watts per British c.p. The Company inform us that they have contracts from the Admiralty, H.M. Office of Works, and many large Corporations.

## REDUCTIONS IN THE PRICES OF METAL FILAMENT LAMPS

WE have received intimations from several of the leading manufacturers of metal filament lamps that from Monday last they have made substantial reductions in the prices of metal filament lamps. The reductions, which are due to further economies in manufacturing processes combined with increased outputs, follow similar lines in the case of all the members of the Tungsten Lamp Association.

The lamps for 100 to 135 volts, in sizes from 10 to 60 watts, are reduced from 2s. 6d. to 2s. 2d., and of the 200 to 260-volt lamps the 30 to 60-watt sizes are reduced from 3s. to 2s. 8d., while the popular 20 and 15-watt sizes are reduced from 3s. 3d. to 2s. 11d., and from 3s. 6d. to 3s. 3d. respectively, and the 80-watt size from 4s. 6d. to 4s. 2d. Of the larger sizes, for all voltages from 100 to 260, the 100-watt lamps are reduced from 4s. 9d. to 4s. 3d., the 200-watt lamps from 9s. to 8s. 6d., and those taking 300 and 400 watts from 17s. to 16s. Certain other sizes in the 20 to 89-volt ranges have also been revised. Most of the makers have made arrangements to credit trade buyers with these reductions on unsold lamps still in stock, and the opportunity is being taken by the more energetic firms to prosecute a vigorous advertising campaign.

The General Electric Co. (67 Queen Victoria Street, E.C.) embody the new prices on the above basis, of their Osram drawn-wire lamps in a new and well-arranged list containing details of the ordinary high and low voltage lamps (now made in the case of 200 to 260 volts in the 15, 20, 30, 40, 60 and 80 watt sizes, and for 100 to 130 also for 10 watts), 20 to 80 volt lamps for country-house lighting, &c., large lamps right up to 1,000 watts (900 c.p.), and candle lamps for all voltages up to 260. They are also issuing attractive notices to be displayed in the windows of agents and contractors, calling attention to the reduction in prices.

The British Thomson-Houston Co. (Mazda House, 77 Upper Thames Street, E.C.) announce similar reductions in the prices of their Mazda drawn-wire lamps, and the revised prices are included in the current issue of their attractive little periodical, *Lighting News*. A very effective series of shop-window announcements of the reduction has been prepared, including a large notice in the form of an arrow, and some ingeniously worded posters.

Siemens Brothers' Dynamo Works, Ltd. (incandescent lamp and fittings department, Tyssen Street, Dalston, N.E.), have informed us of reductions in the prices of their "Wotan" drawn-wire lamps. Reductions are also being made by them in the prices of Tantalum lamps. Of these, the 8 and 10 c.p. sizes from 90 to 120 volts, and the 16, 25, 32, and 50 c.p. sizes for 50 to 130 volts are reduced from 2s. to 1s. 9d., and the 16, 25, 32, and 50 c.p. sizes from 180 to 260 volts are reduced from 2s. 6d. to 2s. 3d. Retailers desiring credit on unsold stocks must send in their returns by Sept. 28th. New price lists of both Wotan and Tantalum lamps are being issued in several attractive forms, and the company are prepared to overprint these for trade customers on receipt of inquiries.

The Electrical Company have also sent us copies of lists and leaflets announcing similar reductions in the prices of "Ægma" drawn-wire lamps, and have prepared advertising material in this connection.

The Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex), have informed us of similar reductions in the prices of their Royal Ediswan metal lamps. The new prices are set out in a complete list just issued, which includes, not only the ordinary standard lamps, but several designs of candle flame and tubular bulbs for special purposes.

The "Leuconium" lamps made by the Stearn Electric Lamp Co., Ltd. (47 Victoria Street, S.W.), are also subject to reductions in price on the same scale.

We are advised also by Pope's Electric Lamp Co., Ltd. (Hythe Road, Willesden), of corresponding reductions in the prices of their "Elasta" wire lamps.

Messrs. Drake & Gorham (1 Felix Street, S.E.), who hold large stocks of metal filament lamps, advise us of similar reductions in the prices of the following lamps marketed by them, viz., Osram, Mazda, Wotan, Ægma, Auriga, Foster, Philips, "Z," Stearn, and Ediswan.

Another manufacturing firm which has found itself able to reduce its prices on the same lines as the firms already mentioned is the Brimsdown Lamp Works, Ltd., who make the "Wirum" lamp.

**The Dublin Transit Trouble.**—In view of the refusal of the railways to handle goods consigned from London, the British Thomson-Houston Co. remind us that they have large stocks of Mazda Lamps, electrical supplies, &c., at their Dublin dépôt, at 25 Suffolk Street.

## "ELECTRICAL ENGINEERING" LITERARY SECTION

### NEW PUBLICATIONS

*We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.*

"Electrical Tables and Memoranda," by S. P. Thompson, F.R.S. 186 pp. 2½ in. by 1½ in.; 15 figures. (London: E. & F. N. Spon, Ltd.) Second edition. 1s. net; by post 1s. 1d.

"Electric Wiring," by W. C. Clinton. 197 pp. 6½ in. by 4½ in.; 105 figures and 4 tables. (London: John Murray.) Third edition. 2s.; by post 2s. 8d.

"Wireless Telegraphy," by C. L. Fortescue. 148 pp. 6½ in. by 5 in.; 20 figures. (Cambridge: The University Press.) 1s. net; by post, 1s. 2d. (Cambridge Manual.)

"Principles of Setting-Out: Securing and Tooling Operations," by A. Parr. 290 pp. 9 in. by 5½ in. 286 figures. (London: Longmans, Green and Co.) 7s. 6d. net; abroad, 8s. 2d.

"Freileitungsbau: Ortsnetzbau," by F. Kapper. 370 pp. 9½ in. by 6½ in.; 351 figures and 2 tables. (Munich: R. Oldenbourg.) 13s. net; by post, 13s. 6d.; abroad, 14s.

"Electrical Meters," by C. M. Jansky. 370 pp. 9½ in. by 6½ in.; 273 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 10s. 6d. net.

"Modern Electrical Theory," by N. R. Campbell. 400 pp. 8½ in. by 5½ in.; 9 figures. (Cambridge: The University Press.) 2nd edition. 9s. net; abroad, 9s. 7d.

"Practical Alternating Currents and Alternating Current Testing," by C. F. Smith. 898 pp. 8½ in. by 5½ in.; 268 figures. (Manchester: The Scientific Publishing Co.) 5th edition. 6s. net; abroad, 6s. 7d.

"Graphs in a Cable-ship Drum-room," by E. Raymond-Barker. 46 pp. 9½ in. by 6½ in.; 10 figures, 4 tables. (London: H. Alabaster, Gatehouse & Co.) 2s. 6d. net; by post, 2s. 8d.

"Switches and Switchgear," by R. Edler. Translated by Ph. Laubach. 401 pp. 9 in. by 6 in.; 365 figures. (London: Constable & Co., Ltd.) 15s. net; abroad, 16s.

"Pocket-Book of Useful Formulae and Memoranda for Civil, Mechanical and Electrical Engineers," by Sir G. L. Molesworth and H. B. Molesworth. 986 pp. 5 in. by 8½ in. (London: E. & F. N. Spon, Ltd.) Twenty-seventh edition. 5s. net; abroad, 5s. 4d.

"The Ideal Code Condenser," by A. Kolkenbeck. 16 pp. 13½ in. by 8½ in. (London: Central Translations Institute.) 2nd edition. 21s. net.

### REVIEWS OF BOOKS

**High- and Low-Tension Switchgear Designs.** By A. G. Collis. 218 pp. 8½ in. by 5½ in.; 94 figures. (London: Constable and Co., Ltd.) 10s. 6d. net; abroad, 11s. 2d.

At the present time there is hardly any branch of electrical work more in need of an up-to-date treatise than that of switchboard design, especially one from the hands of a practical worker in the field. As the size of generating stations increases, the weak spots in the switchgear are being discovered, and it may almost be said that the design of heavy A.C. switchgear is in the melting pot. In some recent cases, in fact, this statement might have been applied literally not to the design of the switchgear, but to the switchgear itself.

The first portion of the book under review is devoted to alternating-current switchgear, and treats rather fully with A.C. principles generally, and particularly the breaking of A.C. power circuits under oil, as studied by the oscillograph. The question of the use of inductances is briefly dealt with, but receives but scant praise from the author, notwithstanding the fact that such devices are now generally considered to be essential for the safe control of large A.C. stations. Certainly some of the views expressed by the author will not receive general acceptance. The mechanical forces set up on short circuit are also touched upon, but the subject might have been enlarged with advantage. A chapter is devoted to A.C. relays of various types, and another to A.C. meters and instruments, but details of actual instruments are not given.

The second portion of the book is headed direct-current switchgear, but all the same it contains a considerable amount of matter on A.C. work. The breaking of direct currents by means of circuit breakers and fuses is treated at some length by means of oscillograms, whilst standard connections of various representative switch panels are also given at some length.

While we have criticised some features of the volume before us, it is only fair to say that a great part of the book is excellent, and both central station engineers and switchboard designers will find it of utility; but the matter might perhaps have been put together in a better manner, and the last few chapters might be rewritten with advantage.

**Electric Wiring.** A Primer for the Use of Wiremen and Students. By W. C. Clinton. 197 pp. 6½ in. by 4½ in. 105 figures and 4 tables. (London: John Murray.) 3rd edition. 2s.; by post, 2s. 3d.

The instruction given on those principles of electrical engineering which should be within the knowledge of men engaged in wiring work are quite sound, and the low price of this "primer" is also a recommendation. Here and there, however, the author falls into the error of employing language too cumbrously accurate, at any rate for the wiremen class, to whom the book is dedicated. For instance, Ohm's law is stated as follows:—

If in any circuit there is a steady, direct electromotive force producing a corresponding steady, direct current, then a change in the value of this electromotive force produces a change in the value of the current in the same ratio, provided that the temperature of the circuit does not alter.

The intelligent reader, however, will find matters made quite clear in the numerous "worked examples" given at the conclusion of each chapter. We trust that it will not be necessary to allow the same lapse of time—seven years—between the third and fourth editions of this book as between the second and third; and we hope that in the next edition the author will include a few more tables, and will educate the reader into the methodical application of these. For instance, in such simple calculations as the determination of the size of a conductor for a given voltage drop, few engineers would work right back from the specific resistance of copper, multiply it by the length of the circuit in inches, and then divide by the resistance given from the current and the required voltage drop. It is therefore hardly reasonable to expect the wireman to do this, and to carry out calculations involving the substitution of 0.00000067 for  $\rho$ ; and it is unkind to invite him to employ formulæ involving the use of a letter so far down in the Greek alphabet as to be beyond the limited knowledge of that language usually retained after a Board School training. We believe that  $\delta$  (pronounced so as to rhyme with "pelt her") is the usual limit.

**Telephone Erection and Maintenance.** By H. G. White. 129 pp. 7½ in. by 5½ in. 47 figures. (London: S. Rentell & Co., Ltd.) 1s. 6d. net; by post, 1s. 9d.

The greater number of wiring contractors and wiremen have hitherto derived their knowledge of house telephone installations from a very limited amount of personal experience and a perusal of the excellent "trade" literature published by the various manufacturers. Although they are able to instal simple telephone systems, they are not always ready to meet "traffic conditions," differing from the more or less conventional requirements, and are frequently completely at a loss when called in to repair or to extend systems unlike the particular one with which they have had experience. Mr. White's book should therefore meet with a cordial reception, and the publishers would have been justified in printing it in a less modest type and in charging a less modest price for it. The matter is thoroughly practical, and the author evidently writes from experience. He has gauged exactly what the average contractor ought to know

about house telephones, and has given him just what is necessary to extend his present limited field. The literary style of the book, and occasionally the grammar, leave something to be desired, but these faults can be condoned on account of the excellence in other respects.

**Freileitungsbau: Ortsnetzbau.** By F. Kapper. 370 pp. 9½ in. by 6½ in. 351 figures and 2 tables. (Munich: R. Oldenbourg.) 13s. net; by post, 13s. 6d.; abroad, 14s.

A book such as this in the English language and in English measurements would be of considerable value to the engineer engaged in the design and construction of overhead transmission or distribution networks. It is the work of an experienced engineer, and is excellently produced. Many important matters of purely an electrical nature, such as protection from lightning and surges, corona loss, the calculation of inductance and capacity of power lines, the effect of variation in altitude, and the design of outdoor switch and transformer poles, are entirely omitted, but the constructional features are treated of in a most thorough manner. The calculations are based on the rules of the Verband Deutscher Elektrotechniker, but the author rightly criticises these in some respects, in particular as regards the high maximum stress of 9 kg. per sq. mm. allowed for aluminium. It should be mentioned, however, that in the new rules of the V.D.E., to come into force on January 1st, 1914, this figure is reduced to 7 kg. per sq. mm. The author states with reason that the correct field for aluminium conductors is low-tension, large-section work with small spans, as the greater sag compared with that of a copper conductor has here the least effect on the height and cost of the pole. The chapters on pole, mast and tower construction are excellently illustrated, foundations and anchorings are fully dealt with, as well as the impregnation, life and cost of wooden poles, the various patterns of insulators, &c. Of particular value is the chapter on the protection of telegraph, telephone and other low-tension wires, road-crossings, &c., from falling high-tension conductors. In concert with most engineers, the author condemns the wire-network cradle as unsightly, unreliable, and even dangerous, and only to be used where low-tension wires pass over high-tension wires. For all other cases, earthing bars to earth the fallen wire, supplemented, if necessary, by additional supports for the conductor and a reduced tensile stress, are recommended. Two methods, adopted with considerable success on the Continent, are illustrated. In one case the conductor is duplicated, the two wires being connected together by a wire zig-zag or ladder formation along the whole length of the span. The other method is already in use in this country, and consists in having one or two additional insulators from which short lengths of cable run out to points a foot or two along the main cable in either direction. Interesting photographs of various methods of elevating erected towers are given, as well as useful hints on line surveying and cable stringing. An investigation of the most economical span under different conditions, and a complete list of cost data, will be found useful for estimating line costs. The final chapters are devoted to the design and construction of low-tension overhead distribution networks so frequent in the villages, small towns and city suburbs on the Continent. Wall brackets, roof poles, street poles and span wires are described and illustrated by numerous effective photographs. The absence of an index is a serious defect to an otherwise excellent book.

**American Telegraph Practice.** By D. McNicol. 507 pp. 9½ in. by 6½ in. 421 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co.) 17s. net.

The treatise is primarily intended for American students, and the systems described differ somewhat in detail from those used in the United Kingdom. Matters of principle are, however, very much the same in both countries, and these are dealt with in a very clear and concise manner. In addition to telegraph practice, the author has included several chapters on the general theory of magnetism and electricity, likely to be of use to a telegraph student. Without unduly labouring the mathematical side of telegraph transmission, the author brings out the essential facts necessary for its efficient achievement so far as signalling and auxiliary apparatus are concerned. The treatise is profusely illustrated with very clearly drawn and easily read theoretical diagrams, but it would have added to the usefulness of the book if a few more wiring diagrams had been included. Specially interesting chapters are those dealing

## MACMILLAN'S NEW & RECENT WORKS.

### Researches in Magneto-Optics.

With special reference to the Magnetic Resolution of Spectrum Lines. By **P. ZEEMAN**, Sc.D., Ph.D., D.Sc., Nobel Laureate, Professor of Experimental Physics in the University of Amsterdam. Illustrated. 8vo. 6s. net.

[*Science Monographs.*]

### Studies in Radioactivity.

By **W. H. BRAGG**, M.A., F.R.S., Cavendish Professor of Physics in the University of Leeds. 8vo. 5s. net. [*Science Monographs.*]  
*KNOWLEDGE.*—"Prof. Bragg's book admirably fulfils the intention of the series, and he has very wisely not omitted to describe briefly the researches of other experimentalists, as well as his own most valuable ones, which come within the subject of the work."

### Elementary Practical Mathematics, with numerous Exercises for the use of Students and especially of Mechanical and Electrical Engineering Students.

By **JOHN PERRY**, M.E., D.Sc., LL.D., F.R.S., Professor of Mechanics and Mathematics at the Royal College of Science, London. 8vo. 6s.  
*EDUCATION.*—"It is written in a manner which is decidedly stimulating. . . . The later chapters of the book contain many interesting applications to mathematical physics, especially telegraphy and telephony. We strongly recommend this book to the discriminating consideration of teachers."

MACMILLAN AND CO., LTD., LONDON.

with the means for minimising the interference from high-tension lines and the installation of simultaneous telegraphy and telephony. Very little information is given respecting overhead and underground line construction, but perhaps this may be remedied in a subsequent edition. The book would form a useful addition to any telegraph and telephone student's library.

**Practical Alternating Currents and Alternating Current Testing.** By **C. F. Smith**. 398 pp. 8½ in. by 5½ in.; 258 figures. (Manchester: The Scientific Publishing Co.) 5th edition. 6s. net; abroad, 6s. 7d.

The fact that this work has now reached its fifth edition is a proof that it is well known and appreciated. There is no outstanding feature in the new edition, as the revision has related mainly to minor points. The book is more than a laboratory manual of experiments, as the explanations, which are of admirable clearness, form in themselves a text-book, giving the student a practical insight into the principles of alternating-current working. Only elementary knowledge is assumed. The worked-out numerical examples enhance the utility of the book. A considerable amount of the space is given to the treatment of transformers, alternators, synchronous motors, rotary-converters, and induction motors, but not the least interesting chapters are those devoted to the single-phase commutator motor, and to the composition of voltage waves.

### Mathematical Physics. Volume I. Electricity and Magnetism.

By **C. W. C. Barlow**. 312 pp. 7 in. by 5 in.; 129 figures. (London: University Tutorial Press, Ltd.) 4s. 6d.; abroad, 4s. 10d.

Notwithstanding its rather high-sounding title, this little work has a modesty which cloaks some undoubted points of merit. It does not pretend to be an advanced mathematical treatise, nor, indeed, can it be accused of being a school cram-book. It is intended to be supplementary to other works of a more qualitative nature by supplying first those quantitative ideas which justify the well-known saying that "Science is measurement." Not only are electrostatics and the flow of electricity, magnetism and its interaction on currents, and thermo-electricity, treated, but there is a final chapter on the modern corpuscular theory which should form an excellent introduction to the point of view from which the facts revealed by modern researches should be viewed. The treatment throughout is clear, and the numerous examples should be of assistance to the student.

**Simple Electric Cookery.** By **May Little**. 7½ in. by 4½ in. 11 plates. (London: Jarrold & Sons.) 1s. 6d. net; by post, 1s. 9d.

This is, we believe, the first book to be published on electric cooking from the cooking point of view, and should be useful to consumers. The authoress has conducted demonstrations in electric cooking at Norwich and elsewhere, and is responsible for various other publications dealing with cookery. Only the first twenty-seven pages are really devoted to the electrical side of the subject. The advantages of electric cooking are briefly set out, a number of forms of cooker are illustrated but very little is said as to their construction. We do not think that everybody will agree with the opening

statement that "the best-known makes of electric cookers are like gas cookers in appearance." The hints on cooking appear to be excellent, but we should like to have seen a little more information enabling the prospective consumer to judge of the merits of apparatus by different makers, to choose a range of apparatus suited to his requirements, and to understand a little more of the electrical side of the subject. Probably, however, the consumers to whom the book is addressed are expected to hire all the apparatus from the supply authority, and to abide by its decision in these matters. More than three-quarters of the book consists of appetising recipes upon which is not our province to express an opinion.

**Dynamo Laboratory Outlines for Students in Electrical Engineering.** By **J. F. Wilson**. 129 pp. 7½ in. by 5½ in.; 84 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co.) 4s. 2d. net.

There are many manuals of electrical engineering laboratory practice, but few as concise as this one, considering the amount of ground which it covers. The author does not aim at elaborate completeness, hence his title "outlines," and in his treatment endeavours to strike the happy medium between making the student an independent discoverer of facts and "spoon-feeding." The utility of the book is enhanced by the numerous references to standard works, and the diagrams are just such as are required. Direct and alternating-current machinery is dealt with, and the sequence of the experiments is well arranged.

**Wireless Telegraphy.** By **C. L. Fortescue**. 148 pp. 6½ in. by 5 in.; 20 figures. (Cambridge: The University Press.) 1s. net.; by post, 1s. 2d. (Cambridge Manual.)

This is one of the latest of the "Cambridge Manuals" series of booklets, over seventy of which have already been published, dealing with the general principles of the great questions engaging the attention of present-day investigators. The volume under review treats the complex subject of wireless telegraphy in as clear a manner as could reasonably be expected within the compass of 140 small pages, seeing that the assumption is made that the reader has no electrical knowledge at all. Of course, at times there is a certain amount of vagueness in the descriptions of plant, its uses, and the way in which it fulfils its functions. Wireless telegraphy on shore, and on craft navigating both the water and the air, is dealt with, and the question of wireless telephony is also touched on. An obvious mistake occurs on page 54, where, six lines from the bottom, the word *useful* has been printed instead of *useless*.

**Principles of Thermodynamics.** By **G. A. Goodenough**. 327 pp. 9½ in. by 6½ in. 123 figures; 3 tables. (London: Constable & Co., Ltd.) Second edition. 14s. net; abroad, 14s. 8d.

The author of this work is a professor in the University of Illinois, and the volume of which the second edition is now before us is one of those painstaking treatises addressed to students of engineering which are being produced in considerable numbers in the United States. The fundamental laws are first developed, and the general thermodynamic

equations are derived. The laws of gases and gaseous mixtures are then discussed, and their technical application considered. In the same way a discussion of the properties of saturated and superheated vapours is followed by the technical applications involving them. The arrangement and logical sequence are good, and the physical conception of entropy, always difficult to present, is attacked in a happy way. Recent quantitative researches on superheated steam are included, and more space than usual is devoted to the flow of fluids and throttling processes. The exercises at the end of each chapter will be found useful by students, and there are tables of references enabling any section of the subject to be followed up further.

**Dynamo Lighting for Motor Cars.** By M. A. Codd. 96 pp. 8½ in. by 5½ in. 126 figures. (London: E. & F. N. Spon, Ltd.) 2s. 6d. net; by post, 2s. 10d.

A large proportion of this little volume is devoted to somewhat detailed descriptions of the many electric lighting sets which are now on the market, and as a comparison of the different methods employed for connecting and disconnecting the dynamo to the cells according to the speed of the drive, and for regulating the voltage of the machine, it is interesting. The introductory part is, perhaps, not quite as good as the descriptive part. There is a little confusion as regards the output and the voltage of a dynamo, and the explanations of the way in which the machines with inherent regulation keep their voltage constant is a little vague. The practical man in charge of motor-cars in search of information on the choice and use of lighting sets will not, however, quarrel with the author on these points, and will find useful hints as regards upkeep and maintenance.

**Wireless Telegraphy and How to Make the Apparatus.** 152 pp. 7½ in. by 4½ in.; 93 figures. (London: Cassell & Co., Ltd.) 1s. net; by post, 1s. 8d.

Although only recently published, this little handbook, which is one of the well-known "Work" series, has already been twice reprinted. Clearly printed and well illustrated, the book, true to its title, gives ample information to enable the amateur to erect a wireless station, and to construct the necessary apparatus. Instructions for making a Wimshurst machine, and for using various kinds of coils, as well as other incidental matters, are also included.

**Pocket-Book of Useful Formulae and Memoranda for Civil, Mechanical and Electrical Engineers.** By Sir G. L. Molesworth and H. B. Molesworth. 936 pp. 5 in. by 3½ in. (London: E. & F. N. Spon, Ltd.) 27th edition. 5s. net; abroad, 5s. 4d.

Our dear old friend "Molesworth," which is still unbeaten as an engineering pocket-book, has now, with its twenty-seventh edition, reached its jubilee, for it is fifty years since the first edition, by Sir Guilford Molesworth, was published; and the preface to this new edition draws some interesting comparisons between the state of engineering then and now. The book has grown from an original modest total of 220 pages to its present 944, and the thorough revision to which it has been subjected before the appearance of every edition renders it as up-to-date now as it was originally. As has been the case now for some time, electrical matters are dealt with separately in a supplement by Mr. Walter H. Molesworth, and the best praise we can accord to this is that it is worthy of the rest of the work, even if necessarily somewhat compressed.

**Electrical Tables and Memoranda.** By S. P. Thompson, F.R.S. 136 pp. 2½ in. by 1½ in. 15 figures. (London: E. & F. N. Spon, Ltd.) Second edition. 1s. net; by post, 1s. 1d.

We are very pleased to see a new edition of the diminutive red pocket-book formerly known as Thompson and Thomas, but now published under the name of the former author only. Even though it is now some years since the first edition was completed, there is a good deal remaining that could never become obsolete, but the revision has nevertheless been thorough, and it is as true that the new matter is fully up to date as it is that none of the old matter is out of date. The metal filament lamp takes its due place, useful information as to illumination is now included, and there are admirable little articles on electric heating and cooking and the cost of electric supply. An abstract is included of the Institution wiring rules, and many practical hints on various branches of electrical engineering appear throughout the work. The copper-wire tables are in convenient form, and tables of trigonometrical functions and logarithms are given at the end. The whole is wonderfully complete for its

## A VALUABLE WORK ON ELECTRICAL INSTALLATIONS.

By Rankin Kennedy, C.E.

If any reader who is interested in this subject will send the coupon below, he can obtain a complimentary copy of an illustrated booklet describing what is probably the most valuable work on the subject ever published.

The necessity for electrical engineers being well acquainted with all designs for installations that have given good results will be readily acknowledged by those whom the matter concerns.

While there are numerous text-books dealing with one branch or another of electrical engineering, they are all prepared for the student, and their contents deal rather with theory than with practice.

The aim of "ELECTRICAL INSTALLATIONS" is to assist the practical man who is concerned with electrical installations in any form, and this because it is recognised that there exists a very large class engaged in constructive and installation work, and a still larger class whose duty it is to take care of the machinery employed in working by electricity. Most of these men have picked up a working knowledge of their employment. What they need is to study the elements of the science of the subject. These elements are fully treated of in the first volume; and on the sound foundation thus laid, the author, who is a civil and electrical engineer by profession, and recognised as being in the front rank of electricians and engineers, proceeds to deal with every possible form of electrical installation, their principles and practical application.

This work describes and illustrates the best practice in all branches of the electric light and power installation business; the last volume treats of all the lighter branches of electrical manufactures—telephones, wireless telegraphy, and kindred subjects.

This second and revised edition of the work justly claims to have brought all subjects up to date with descriptions and information regarding recent machinery and apparatus. The matter has also been re-arranged so that all information relating to one subject follows consecutively.

The illustrations number 1,000, and there are eight fine plates in each volume. In addition, each plate contains a coloured cardboard sectional model of an electrical machine in four sections superposed.

### TWO OPINIONS:

**Mr. PONTECORVO, Engineer, The British Westinghouse Electric Co., Ltd., Manchester:**—"The work is very clear in its explanations, and gives, by means of well illustrated experiments, a complete idea of the electrical phenomenon. The chapter with hints as to how to build experimental apparatus seems particularly useful. Printing and illustrations are clear and accurate."

**Mr. A. H. SHAW, M.I.E.E., A.M.I.Mech.E., Manager Ilford Electricity Supply and Tramways, Ilford:**—"I consider this work is all you claim for it. The matter is clear and up-to-date, and the diagrams and plates are particularly good. The article on supply meters should prove very useful. This is a work that everyone engaged in the practical applications of electricity should have access to."

## A FREE BOOKLET.

To the CAXTON PUBLISHING CO., LTD.,

97, Surrey Street, London, W.C.

Please send me, free of charge, and without any obligation on my part, Illustrated Booklet on ELECTRICAL INSTALLATIONS, and particulars of your plan whereby the volumes are delivered for a first payment of 1s. 6d., the balance being paid in small monthly instalments.

size, which is such that it need not oust all the legitimate occupants of a cigarette case.

**Modern Electrical Theory.** By N. R. Campbell. 400 pp., 8½ in. by 5½ in. Nine figures. (Cambridge: The University Press.) Second edition, 9s. net; abroad, 9s. 7d.

Though nominally a second edition, this volume is to all intents and purposes, a new book. It really belongs more to the domain of physics than of electrical engineering, and has been written for those who have an adequate acquaintance with the older physics, and wish to study its modern developments, especially in regard to the Principle of Relativity, which the author shows must supersede the Principle of Moving Axes. There has been but little change in our conception of the electronic theory since the date of the first edition some six years ago, but more knowledge concerning some of the difficulties raised, and the most likely ways of solving them, has developed. For instance, though considerable advance has been made in our knowledge of metallic conductivity and in the problem of radiation generally, we are still confronted with many difficulties. The book is divided into three parts, the first deals with the electronic theory, and covers the properties of electricity, dielectrics, conductors, gaseous conduction, magnetic susceptibility, and magneto-optics. The second deals with every known kind of radiation, while the third discusses the properties of matter, the structure of the atom, and the properties of moving systems. Much in this last section is new, and although necessitating a change in our ideas, the arguments are convincing, as soon as one appreciates their meaning. There are references with explanatory notes, at the end of each chapter to fuller discussions on the same lines as those given in the chapter concerned.

**A Text-book of Physics.** By R. S. Willows. 471 pp. 8 in. by 5½ in. 280 figures. (London: Edward Arnold.) 7s. 6d. net; abroad, 8s. 2d.

A considerable popularity of this work can be foreseen, in spite of the keen competition by the many other books on this subject now on the market. The first chapter is given over to a consideration of the general properties of matter; then follow chapters on heat, light, sound, magnetism, and electricity. The standard is that of the intermediate examinations of the various Universities and of the Civil Service Commission. The method and order of presentment, combined with the neat explanatory drawings of apparatus, is to be commended, as there can be no doubt that it is in line with the most rational way of teaching by lectures and laboratory experiments. A large proportion of the experiments in each section are given at the beginning of that section, so that experiment is the more easily kept ahead of theory. With regard to the sections on magnetism and electricity, the former is dealt with first, then some of the more elementary parts of the branch known as electrostatics, followed by what is often known as current electricity, while the section is closed by more advanced considerations of some electrostatic phenomena. The consideration of magnetism and electricity takes up about one-third of the book, and is straightforward and exact—not confused with out-of-date historical matter or side issues.

**Principles of Setting-Out: Securing and Tooling Operations.** By A. Parr. 290 pp. 9 in. by 5½ in. 236 figures. (London: Longmans, Green and Co.) 7s. 6d. net; abroad 8s. 2d.

The title of the work implies merely marking off of work and the setting up for machine operation, whereas, in spite of its comparatively small size, the book ranges throughout the whole field of workshop practice. The most modern examples of gauges, jigs, clamps, and fixtures are well illustrated, and even the principles of gearing are touched upon; the result is a most useful treatise for young engineers, but perhaps a little too condensed for workshop use, and a little too detailed for the general engineer. Incidentally, we may mention that we do not agree with the author's opinion that malleable cast iron may in many cases be equally satisfactory to forgings of iron or steel, nor do we consider two illustrations of fixtures for planing machines quite suitable for general use, but, as a whole, the work is excellent.

**Engineering as a Profession.** By A. P. M. Fleming and R. W. Bailey. 288 pp. 7½ in. by 5 in. (London: John Long, Ltd.) 2s. 6d. net; by post, 2s. 9d.

The fact that we are ourselves continually receiving inquiries as to the best course to be pursued for the education of those who wish to enter the engineering profession would indicate that some such book as that before us should be welcome. The object of the authors is to give a general idea of the nature of the training required, to give particulars facilitating a choice of technical school or college suitable for the particular case, with information also as to works, &c., where pupils are taken, as well as to indicate some of the ways in which the profession may be entered when the earlier part of the training is complete. The list of appointments and qualifications gives a good general idea of the class of openings that exist, but in matters of detail

there are, of course, frequent changes. A short chapter also notices the principal features of engineering training as carried out in some other countries. There is useful information as to facilities for obtaining training at minimum expense.

**Researches in Magneto-Optics.** By P. Zeeman. 219 pp. 8½ in. by 6 in. 74 figures. (London: Macmillan & Co., Ltd.) 6s. net; abroad, 6s. 6d.

The author has in this publication supplemented the lecture entitled "Recent Progress in Magneto-Optics," which he delivered before the Royal Institution in 1906. After some notes on modern spectroscopes and their resolving powers, i.e., their capacity to separate vibrations which differ little in wave-length as effected by gratings, prisms, &c., the magnetic resolution of emission lines and allied problems are dealt with. An interesting chapter is that dealing with solar magneto-optics, and in the last chapter some account is given of the behaviour in the magnetic field of the atom built up of electrons and positive electricity, as conceived by Sir J. J. Thomson. In general the material in the different chapters has been arranged historically, so that a connected narrative of the progress in this science, and embodying the important experimental and theoretical contributions of the author, is available to all.

**Taschenbuch für Monteur Elektrischer Beleuchtungsanlagen.** By G. Lux and C. Michalke. Edited by S. F. von Gaisberg. 284 pp. 6½ in. by 4½ in. 210 figures. (Munich: R. Oldenbourg.) Forty-sixth edition. 2s. 6d. net; by post, 3s.

The fact that this is a forty-sixth edition shows that the book is a great favourite of the German erecting electrical engineer and foreman. English readers who understand German and take an interest in German practice, will find it useful.

**Fairbrother on Patents.** By H. Fairbrother. 48 pp., 8½ in. by 5½ in. (Birmingham: Bromhead & Co.) 1s. net; by post 1s. 2d.

To those who only desire to know the fundamental patent laws of the various countries where patent protection is granted, this handbook enables such information to be obtained in a minimum of time. The countries thus dealt with are arranged in alphabetical sequence, and the notes show the kinds of patents granted, the life of a patent, terms of payment, including renewal fees, if any, conditions as to working, marking, &c. Some indication is given of the value of a patent so obtained, but the cost of obtaining it, and the amount of the payments necessary, are unfortunately not included, possibly because considerably more space would be required to make these matters clear than is available. It should prove a handy work of reference on those matters with which it deals.

**A Pocket Glossary of English-German and German-English Technical Terms.** By J. G. Horner and O. Holtzmann. 298 pp. 4 in. by 2½ in. (London: Crosby Lockwood and Son.) 3s. net; abroad, 3s. 2d.

Those who have much to do with German technical literature should find this little work very convenient. On account of its small size, it can be always handy, but, considering its smallness it appears very complete. A somewhat extensive range of engineering is covered, and there is a fair proportion of electrical terms. Electrical engineering is not, however, quite so well represented as mechanical workshop practice. The English-German and German-English sections are separate.

**Proceedings of the Optical Convention, 1912.** Vol. II. 359 pp. 10 in. by 7½ in. 167 figures. (London: Hodder and Stoughton.) 10s. net; abroad, 11s.

In this volume are recorded the proceedings of the second Optical Convention, which met in London in June, 1912, under the Presidency of Prof. Silvanus P. Thompson. Among the 36 papers which are printed, together with the discussions on them, perhaps the most interesting, from the point of view of the electrical engineer, are one on measurements and notes on the visibility of point sources of light, by C. C. Paterson and B. P. Dudding, and another on recent advances in the measurement of light and illumination, by J. S. Dow and V. H. Mackinney. The volume is well got up, and covers a considerable variety of subjects.

**The Ideal Code Condenser.** By A. Kolkenbeck. 16 pp. 13½ in. by 8½ in. (London: Central Translations Institute.) Second edition. 21s. net.

This is the second edition of a work first published in 1906, the main object of which is to enable two code words taken from any recognised numbered code to be condensed into one artificial word to effect a saving in the cost of transmission by using the figures and forming out of them a pronounceable ten-letter word by means of tables of syllables. The only material alteration in the tables is an improved arrangement of the check indicator table, making a two-figure difference between all similar combinations. Users of the first edition can obtain free of charge a sheet giving the revised arrangement. The explanations and instructions, which are in English, French, and German, are also a little fuller than before.

## "ELECTRICAL ENGINEERING" LIST OF SELECTED TECHNICAL BOOKS

We shall be pleased to send any of the following books to addresses in the United Kingdom at the *net* published prices named, unless otherwise stated. The increased price for sending abroad is also quoted after each book. All the books listed have been recommended by our editorial staff and reviewers.

Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-206 Temple Chambers, Temple Avenue, E.C., and should be accompanied by a remittance.

## THE DIESEL ENGINE EXPLOSION AT BRAY

THE official report by Mr. G. S. Taylor (Inspector of Factories) to the Home Office on the explosion which occurred at the Bray Electricity Works on July 10th, 1912 and resulted in the death of C. Coates, the head fitter, and serious injury to Mr. J. U. Sowter, Chief Engineer, and Mr. McDonnell, Assistant Engineer, has now been published.

The report commences with some general notes on the development and working of the Diesel engine, and describes the general arrangement of the particular engine in question, which was a vertical single-cylinder four-stroke engine of 12 in. bore, with a two-stage compressor driven off its own shaft, and the usual arrangement of air vessels and piping, made by Mirrlees, Bickerton & Day, of Stockport. In consequence of the air pressure in the air vessels having been found to be reduced below the value required for starting, a cylinder of compressed oxygen had been procured and connected to them as a convenient means of obtaining the necessary pressure in the absence of any auxiliary compressor or available means of running the engines own compressor. To facilitate starting, the pipe leading to the fuel injection valve had been charged with kerosene. The engine got away satisfactorily on the compressed air, but shortly after the lever controlling the cam shaft was shifted into the running position, an explosion occurred at the fuel valve on the cylinder, and after what is described as a blue flame had been seen to travel along the blast pipe to the blast air vessel, the latter exploded with great violence. The condition of the fragments is described in the report, and no fault is found with the construction of the blast vessel. Various possible causes of explosion are discussed, and finally the following conclusions are arrived at:—

The explosion of the blast vessel was caused by the ignition of an oily deposit on its interior. Ignition was transmitted by a flame explosion from the fuel valve casing passing along the blast pipe, but there is no evidence to show whether this ignition originated in the fuel valve casing or was transmitted from the engine cylinder. Ignition was facilitated, and the resultant explosions were intensified by the large volume of compressed oxygen contained in the blast vessel and blast pipe. This compressed oxygen had been used in the blast vessel in order to raise the pressure sufficiently to start the engine, and was so used in accordance with the printed instructions issued by the makers of the engines. Owing to the presence of deposits of lubricating oil carried over from the compressors, the same danger of ignition and explosion exists in blast vessels of Diesel engines as in the air receivers of air-compressing plants. There are considerable practical difficulties which prevent the removal of all the lubricating oil vapour from compressed air before it enters the blast vessels, although entire removal is very desirable. "Back fires" or explosions are sometimes transmitted from the cylinders of Diesel engines to the fuel valve casings and blast pipes; and ignitions, sometimes accompanied by explosions, occur in the high-pressure air delivery pipes of the compressors. Loss of air pressure from the blast and starting air vessels of Diesel engines occurs more frequently than the engine makers admit. This loss is often due to carelessness, but sometimes due to the inexperience of the engine attendant.

The various possible methods of recharging the air vessels of Diesel engines are discussed, and the danger of using compressed oxygen or combustible gases instead of air is insisted upon. It is pointed out that at least two explosions of blast vessels have occurred on the Continent owing to the use of compressed oxygen, and various points in connection with the prevention of accidents with Diesel engines are discussed, and finally it is suggested that the observance of the following recommendations would tend to reduce the risk of explosions and accidents in connection with the running of Diesel engines:—

Compressed oxygen, on account of its intense chemical affinity, and combustible gases like hydrogen, should not be used for the purpose of recharging air vessels, and a warning to this effect should be issued by the makers of Diesel engines. Definite instructions should be issued by the makers with regard to the adoption of safe methods for recharging air vessels. Only competent engineers, or experienced men under the direct supervision of a qualified engineer, should be employed as engine attendants on Diesel plants. Traces of oil or oil vapours should be removed as far as practicable from the compressed air before it passes into the blast vessel. Air vessels, especially blast vessels, should be cleaned and examined internally as far as practicable once every twelve months; they should also be tested hydraulically once in every four years, and the amount of expansion of the vessel

under the test pressure should be carefully gauged. Some device should be fitted for preventing the transmission of flame explosions along the compressed air pipes.

## ELECTRIC VEHICLES

IT will be remembered that at the meeting of the Incorporated Municipal Electrical Association in June it was decided to form a committee regarding the use of electric battery vehicles. This committee is now at work, with Mr. R. A. Chattock as chairman, and in addition to seven members of the I.M.E.A. will include co-opted representatives of the company-owned supply undertakings in London and the provinces, battery and vehicle manufacturers, the R.A.C. and the A.A. and M.U. In connection with the representation of the vehicle and battery makers, as there is no society able to nominate representatives, firms interested are invited to communicate with Mr. F. Ayton (Corporation Electricity Supply Dept., Ipswich), Hon. Sec. to the Committee, with a view to a meeting being arranged for the nomination of representatives.

It is proposed that the scope of the Committee's work shall, at the outset, cover the following:—To impress upon supply authorities the desirability of encouraging the use of the electric vehicle by agreeing to supply energy for charging at a reasonable price; by calling meetings of the motor-car traders and hotel proprietors to induce them to provide charging facilities; giving assistance to motor-car traders; advertising the whereabouts of charging stations; and impressing upon municipal bodies and others the advantages of the electric vehicle. Distributing information and literature among likely users, and providing charging outfits on hire. The Committee also propose to draw up recommendations as to standard sizes of charging outfits for D.C. and A.C. systems, and uniformity in battery charging instructions; to issue rules for the use and maintenance of electric vehicles, and to take up the standardisation of motor ratings, voltages, carrying capacities and speeds for commercial vehicles, wiring details, terminals, battery units, &c.

It is also intended to approach insurance companies with a view to obtaining favourable rates for insuring electric vehicles, in consequence of the reduced fire risk, &c.; to arrange for parades and exhibitions; to collate and to publish information; to take up with the authorities the question of the rating of electric vehicles for taxation purposes, and to issue maps with charging stations indicated, together with a list of the latter and tariffs.

**Switchgear Alterations at the Greenwich Generating Station of the L.C.C. Tramways.**—The alterations in the switchgear at this station, which were described in our issue of September 11th, and are to be carried out shortly, are largely based on recommendations made by Mr. G. W. Partridge, Engineer-in-Chief to the London Electric Supply Corporation, who was called in to report after the breakdowns which occurred last summer.

**Mercury Vapour Lamps and Market Gardening.**—The Westinghouse Cooper Hewitt Co., Ltd., have sent us a copy of an interesting communication which they have received from Miss E. C. Dudgeon, of Lincluden House, Dumfries, referring to some experimental work on the acceleration of plant growth under mercury vapour lamps. The results in two greenhouses were compared. In one of these mercury vapour lamps were placed about 4 ft. above the plant; the other was used as a "control" house to compare the results with the normal growth of the plants in question. The mercury lamps were turned on about an hour before sunset and kept on for about four and a half hours. It was found that seeds germinated very much quicker under the action of the mercury vapour lamps; for instance, French beans in thirteen days, instead of twenty-one days; carrots in eleven days, instead of twenty-six days; cauliflower six days, instead of twenty-six days; maize eight days, instead of fifty-seven days; and peas seven days, instead of sixteen days. Strawberries and various flowers showed a marked increase both in foliage and crop under the mercury lamp treatment. That the result was due to the lamps was indisputably shown by the fact that the plants nearer lamps showed additional growth to those further away in the same greenhouse. The houses were kept at a comparatively low temperature, and it is suggested that a considerable amount of heating may be saved by using mercury vapour lamps. The plants brought on by this means are also said to be hardier than those forced in the ordinary way, so that practically no hardening-off is required before they are planted in the open.

## ELECTRICAL POWER SCHEME AT THE WORKS OF THE SALT UNION

**A**N interesting example of economy in fuel obtained by the adoption of electrical methods is presented by the scheme which has just been carried out at the Winsford Works of the Salt Union, on the River Weaver, by the British Westinghouse Co. Here coal is utilised primarily for the evaporation of brine, but a considerable portion is also accounted for by the requirements of pumping and other machinery. In addition to the usual open evaporating pans, there is a triple effect vacuum evaporator, formerly supplied with steam through reducing valves from six Lancashire boilers operating at 60 lb. pressure. There was room for considerably increased efficiency here by raising the boiler pressure and utilising steam engines to reduce the pressure to that necessary for the vacuum evaporator, using the power developed by these engines to generate electricity for distribution all over the works. The scheme was prepared by Mr. H. L. Riseley, of Newcastle-on-Tyne, in collaboration with Mr. G. W. Malcolm, Chief Engineer to the Salt Union, and the contract for the complete work, including the provision of the generating sets, extensive overhead transmission lines, motors and control gear, and coupling up the various drives, ran into about £15,000. A separate contract was placed with the Stirling Boiler Co. for three water-tube boilers working at 200 lb. pressure. The steam from these is passed through either one or both of two 375-kw. three-phase, 600-volt 50-cycle alternators, driven by Browett-Lindley engines. Power is distributed throughout the works by overhead lines erected by British Insulated & Helsby Cables, Ltd., as sub-contractors to the Westinghouse Co.

In all about fifty motors have been installed at the works, ten in connection with brine pumps, previously driven by small isolated steam engines. These, which run at speeds between 7 and 14 r.p.m., are now driven through double reduction helical gears made by the Power Plant Co., which arrangement has proved eminently satisfactory.

Before the electrification of the Winsford Works had been put into operation, it was decided that a larger triple-effect vacuum evaporator, together with electrical generating plant, should be installed at the extensive works at Weston Point, Runcorn. These works are away from the brine fields, but the requisite brine is pumped through about ten miles of 15-in. diameter piping from Northwich, where it is raised by means of two Westinghouse-Rateau turbine pumps, each capable of dealing with 35,000 gallons of brine per hour. The electrical power plant at Weston Point forms part of an entirely new works, but it is our object here merely to describe briefly the power plant from the electrical aspect. The boiler-house at Winsford contains Stirling boilers working at 200 lb. pressure. Part of the steam raised was at first passed through either or both of two 725-kw. Browett-Lindley-Westinghouse generating sets, and from the exhaust of these engines is driven one 375-kw. three-phase, 50-cycle, 440-volt alternator, and a 350-kw. 240-volt D.C. machine, the former for supplying current for power, and the latter for electrolytic purposes. Since these sets were installed the whole scheme has grown so rapidly that they now only form part of the far larger project.

From the beginning it was realised that the amount of electrical energy available from the steam required for the vacuum evaporator would be far in excess of the requirements of the works, and, therefore, steps were taken to obtain Provisional Orders for the urban and rural areas of Runcorn and the town of Widnes. These being obtained, a subsidiary Company, known as the Mersey Power Co., was formed to deal with this part of the undertaking, and a further order was placed with the British Westinghouse Co. for two 1,500-kw. reducing turbines, the alternators being in this case designed for three-phase, 50 cycles, 6,600 volts. Static transformers with the requisite switchgear are provided to form a connecting-link between these alternators and those coupled to the reciprocating engines mentioned above. A third turbine, similar to the two now installed, is in course of manufacture, and will be erected and put into operation in the near future.

A brief description of the reducing and governing valve gear will doubtless be of interest. A governor valve, operated through an oil relay in the usual way, controls the admission of steam to the high-pressure section of the turbine. This valve governs for speed alone, and is entirely independent of the reducing valve gear. The high- and low-pressure stages of the turbine are divided by a solid diaphragm, the passage between the two parts being controlled by a balanced valve.

This valve is opened and closed by an oil relay, whose pilot piston is moved according to the position of a steam piston, one side of which is connected to the vacuum-plant main. Suppose the vacuum plant to be taking all the exhaust steam, then the low-pressure section of the turbine is entirely out of commission. If now the supply of exhaust exceeds the demand of the vacuum plant, the pressure in the vacuum plant main rises and moves the steam piston, which shifts the relay pilot valve, so that the oil relay opens the valve connecting the high- and low-pressure casings. Steam then passes through to the low-pressure part of the turbine, and thence to the condenser. Thus it will be seen that part or all of the steam may pass to the condenser or to the vacuum plant, according to the position of the valve connecting the high and low casings.

A central surface-condensing plant with turbine-driven auxiliaries is installed below the turbines. This is kept continually in service, so that whenever excess steam over and above that required by the vacuum plant is called for by the generating sets, it is efficiently expanded in the low-pressure stages of the turbine. A second smaller surface condenser is being installed to act as a stand-by to that already mentioned. This second condenser is being erected on the ground level just outside the engine room.

There are some forty-five motors installed at the new Weston Point Works, and of these ten are used directly in connection with the vacuum evaporator; four operating brine and air pumps, three the stirrers in the brine pans, and three the elevators which deal with the salt after it leaves these pans. The size of these motors varies from 12 to 150 h.p., and as it was desired to concentrate their control, as well as the control of the steam to the evaporator, at one point, a special centralised control platform was installed. The old Weston Point Works are driven by direct-current electric motors. A Westinghouse rotary-converter fed from the power station just described has been installed there to give the necessary direct-current supply.

Our thanks are due to Mr. G. W. Malcolm, Chief Engineer of the Salt Union, Ltd., and Engineer and Manager of the Mersey Power Co., and also to Mr. H. L. Riseley, Consulting Engineer, for permission to publish the information given in this article.

## STREET LIGHTING REFLECTORS

**A** STREET-LIGHTING appliance which the British Thomson-Houston Co. (Mazda House, Upper Thames Street, E.C.) have recently placed on the market is the radial wave reflector illustrated here. This can be used with any form of street-lighting bracket, post or cable-suspension equipment. In street lighting it is, of course, essential that the light should be distributed in such a way as to give the smallest possible diversity factor in the intensity of illumination. Many existing reflectors give a high intensity of light immediately

RADIAL WAVE REFLECTOR WITH HOOD.

under the lamps, which intensity decreases very rapidly until, midway between two posts, the illumination is quite inadequate. The B.T.H. radial wave reflector has been designed to overcome this difficulty, and its peculiar construction enables it to project a much higher candle power between the horizontal and an angle of 30° below the horizontal than the ordinary concave reflector.

Radial wave reflectors are made of stamped fluted steel, with a reflecting surface of white vitreous enamel, and are painted green outside. They are provided with heavy glazed porcelain hoods, and are fitted with Edison screw holders.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,357.

In horn lightning arresters, what clearance of gap is allowed per 100 or 1,000 volts?—"SPARK."

(Replies must be received not later than first post, Oct. 2nd.)

### ANSWERS TO No. 1,355.

Ventilation is required in a static transformer chamber to keep the transformer as cool as possible. Show how the size of openings is determined, how the difference in level between inlet and outlet louvres will effect the size, and how the cubic contents of the chamber affects the question. Assume two 200 k.v.a. oil-cooled transformers in a chamber 10 ft. by 8 ft. by 12 ft. high. Calculate the size of nett opening required, and show the difference if a chimney is built to a height of 20 ft. above ground.—"AIR SUPPLY."

The first award (10s.) is made to "A.G.R.," for the following reply:—

Assuming average figures for the temperature of the air, namely, 15° C. at the inlet and 25° C. at the outlet, this latter being the maximum air temperature allowable (10° C. rise in temperature above 15° C.), we may proceed as follows:—Cubic contents of room = 10 × 8 × 12 = 960 cub. ft.; weight of 1 cub. ft. of air at 0° C. = 0.0807 lb., and at 15° C. = (0.0807 × 273) ÷ 288 = 0.0793 lb. (273 and 288 are the absolute temperatures corresponding to 0° C. and 15° C., as the absolute zero is -273° C.).

The weight of the cubic contents of the room at 15° C. is therefore 960 × 0.0793 = 76.2 lbs.

Now the work required to raise 1 lb. of water through 10° C. is 1,390 ft. lbs., and the specific heat of air at constant pressure is 0.238, so that the work required to raise 1 lb. of air through 10° C. is 1390 × 0.238 × 10 = 3310 ft. lbs., and the work required to raise 76.2 lbs. of air through 10° is 3310 × 76.2 = 252,000 ft. lbs. Assuming the efficiency of the transformers to be 98 per cent., then the total losses on the two transformers will be 8 K.V.A., and 8 K.V.A. = 8000 ÷ 746 H.P. = 8000 × 550 ÷ 746 = 5900 ft. lbs. per sec. Therefore the room requires to be refilled with air every 252,000 ÷ 5900 = 42.7 secs. Thus 960 cub. ft. of air are required every 42.7 secs., so that the rate of flow of air must be 22.5 cub. ft. per sec.

Assuming that the air inlet is at the floor-level and the outlet at the top of the room, the distance between them being about 10 ft. (i.e., between centre lines), then the pressure causing the flow is the difference in weight of a column, 10 ft. high, of cold air, and one, 10 ft. high, of warm air.

Assuming 1 sq. ft. cross-section, we have that  $\left[ \frac{0.0807 \times 273}{288} - \frac{0.0807 \times 273}{298} \right] 10 =$  difference in pressure in lbs. per sq. ft. = [0.0764 - 0.0739] 10 = 0.025 lbs. per sq. ft. Now pressure head = (approx.) velocity head.

$\therefore (0.025 \div 0.0764) = v^2 \div 2g$ , where  $v$  = velocity in ft. per sec.,  $g$  = acceleration due to gravity = 32.2 ft. per sec. per sec., and pressure head = pressure in lbs. per sq. ft. ÷ wt. per cub. ft. at 15° C. Therefore the velocity of air =  $\sqrt{0.025 \times 64.4 \div 0.0764} = \sqrt{21.1} = 4.6$  ft. per sec. Area of opening required is therefore = 22.5 ÷ 4.6 = 4.9 sq. ft. (say 2 ft. 6 in. long by 2 ft. high).

With a chimney 20 ft. high, the effective height would be about 19 ft. above centre of inlet. Pressure causing flow, in lbs. per sq. ft. = [0.0764 - 0.0739] 19 = 0.0475 lbs. per sq. ft., so

that new velocity of air =  $\sqrt{64.4 \times 0.0475 \div 0.0764} = \sqrt{40} = 6.33$  ft. per sec. Area of opening = 22.5 ÷ 6.33 = 3.55 sq. ft. (say, 1 ft. 10 in. long by 2 ft. high).

No second award has been made.

## ANSWERS TO CORRESPONDENTS

A. E. J.—The system of stopping trains which have overrun a signal described in your letter is practically the same in principle as the "automatic train stop" employed on the London Underground Railways and elsewhere, although slightly different in detail.

## A SIMPLE ROTARY AIR-PUMP SYSTEM

TO meet the demand for a simple rotary air-pump system where space is a consideration, Willans & Robinson, Ltd. (Victoria Works, Rugby), have taken a licence to manufacture under the Müller-Josse patents. A large number of condensing plants on this system, up to 10,000 kw., have already been built on the Continent. There are two modifications of the systems, which may be called the "shunt" and "series" system respectively. In either case the air is extracted from the condenser by an air ejector, and the condensed steam is extracted by a separate centrifugal pump from the bottom of the condenser. Figs. 1 and 2 give an outline of the two systems. The first is used where the head across the circulating pump is sufficient to effect the air extraction.

In this case the main circulating pump is designed to deliver a greater quantity of water than is required as cooling water in the condenser, the surplus water being used as air ejector water, and is returned to the source of supply

FIG. 1.

FIG. 2.

or to the suction side of the circulating pump. Where the "series" system is used, the whole body of the condenser cooling water is passed through the air ejector before entering the condenser. Thus, in the shunt system the power required for extracting the air is determined by the surplus quantity of water at the given head, and in the series system by the given quantity of water at a surplus head. In neither case is a greater quantity of cooling water consumed than where a reciprocating air pump or any other rotary air pump is used. Only one simple centrifugal pump is needed for supplying the condenser cooling water and the air extraction water. The power required in extracting the air is dependent on the design of the ejector and the power actually consumed in compressing the air. To reduce to a minimum the power required in air compression, the latter should be carried out at the lowest possible temperature, namely, the temperature of the cooling water, as is done in this system.

A plant of 8,500-kw. set capacity is in hand for the Sheffield Corporation, and the Glasgow Corporation Tramways Department has ordered a 5,000-kw. for the Pinkston Power Station, while the London & South Western Railway Co. has ordered plant totalling 25,800 kw.

**An Electrically-driven Pump.**—A useful little electric pumping set has just been fitted up by Messrs. Merryweather and Sons, of Greenwich, at the London offices of the *Daily Sketch* in Shoe Lane. The pump is of the rotary type, capable of delivering 250 gallons per hour against a total head of 6 ft. 6 in., and is direct-coupled to an electric motor of ample power to drive it, wound for a 200-volt direct current. The pumps and motor are mounted on a bedplate, forming a very compact set. The pump will be employed for emptying a sump in the basement, and is arranged to start automatically. In order to effect this, a float is provided, which operates a switch and starts the motor when the water in the sump rises above a certain level. As the water is pumped out the float falls and cuts off the current.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**HEATING AND COOKING.**—A pamphlet relating to the heating and cooking appliances suitable for the requirements of a small household has been got out by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), in connection with the demonstrations of Plexsim apparatus which are now being arranged throughout the country. The pamphlet gives the cost of the apparatus, together with the cost of using it at various prices of electrical energy. It is neatly arranged for over-printing.

**METAL FILAMENT LAMPS.**—A card has been issued by the Osram Lamp Works, Ltd. (Hammersmith, W.), giving the names of the 12 different makes of metal filament lamps against the suppliers of which actions to restrain infringement of their patents and for damages have been commenced. Interim injunctions restraining infringement have been granted against the suppliers of four other makes of lamps and three cases made final.

**SWITCHGEAR AND FUSEBOARDS.**—A preliminary abridged issue of a catalogue dealing with switchgear and fuseboards has just been issued by the Sun Electrical Co., Ltd. (118-120 Charing Cross Road, W.C.). We note that the list contains an extensive range of switch and fuseboards, main switches, iron-clad switches, &c., for industrial and domestic purposes. Included also are boards designed to comply with the latest Home Office regulations.

**"SUPERLUX" REFLECTORS.**—A complete catalogue of "Superlux" reflectors (referred to in last week's *ELECTRICAL ENGINEERING*) has also just been issued by the Sun Company. These reflectors are divided into four classes: (1) pure white glass ware, (2) vitreous enamelled steel, (3) aluminium, and (4) glass mirror reflectors. All are designed to give definite quantities of light just where it is wanted. Useful data, tables, &c., are being prepared for publication to assist clients in selecting the correct reflector to fulfil any given condition.

**MAZDA LAMPS.**—Some further specimens of folders, leaflets, &c., which are being sent to contractors in connection with the Mazda "Arrow" advertising campaign, have reached us from the British Thomson-Houston Co., Ltd. (77 Upper Thames Street, E.C.), who urge all contractors to 'phone or wire for literature and supplies at once.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**COOKERS.**—A leaflet from Ferranti, Ltd. (Central House, Kingsway, W.C.), gives prices, weights, and detailed particulars of Ferranti electric cookers. The whole cooker is well designed and of substantial construction. The elements can be very easily withdrawn for clearing or replacement by new ones, and the wiring is readily inspected. The heating units have been thoroughly standardised.

**OPAL REFLECTORS.**—Siemens Brothers Dynamo Works, Ltd. (Tyssen Street, Dalston, N.E.), has just got out a price list dealing with the "Marbella" opal reflector, which is obtainable in distributing or concentrating types. The light is reflected in the direction required by one reflection, and the lamp is hidden to the pip so that "glare" and "eye-strain" are avoided.

**POCKET LAMPS.**—A pamphlet covering the extensive range of "Geeko" pocket battery lamps, hand lamps, ceiling clocks, &c., supplied by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), is now available.

**LANTERNS.**—A new edition of the General Electric Company's list of lanterns for shop, warehouse, and street lighting has also just been published. The lanterns are suitable for metal filament lamps from 20 to 1,000 watts.

**MOVABLE FITTINGS.**—A much wider range in movable fittings for lighting, telephones, and other purposes is embraced in the most recent edition of the catalogue of John Dugdill & Co. (Failsworth, near Manchester) than in the list which it supersedes. Besides spring-reel fittings, travelling lights, and telescopic pendants, special fittings for hospitals, altars, workshops, schools, engineering shops, &c., are included. Arc light brackets, portable adjustable standards, and shades and reflectors are also dealt with, as well as various accessories.

**TAPPING AND REAMERING MACHINES.**—The Power Plant Co., Ltd. (West Drayton, Middlesex), has now produced a new list illustrating and describing electric hand-drilling, tapping, and reamering machines.

**"ELECTRICAL SERVICE."**—This is the title of an attractive booklet which Electrical Installations, Ltd. (27 and 28 Martin's Lane, Cannon Street, E.C.), has produced for the purpose of impressing possible clients with the advantages of electricity for illumination in the private house, office, shop, or factory. Heating and power are also dealt with.

**IRONCLAD SWITCHGEAR.**—A number of recently pub-

lished leaflets have been sent us by A. Reyrolle & Co., Ltd. (Hebburn-on-Tyne). These deal with overload protection, telephone cable dividing boxes, explosion-proof quick make and break oil-switches, sheet steel panels, plug boxes with switches and fuses, enclosed high-pressure tubular fuses, flat-back switchgear, draw-out ironclad switchgear, and the company's "Merz Price" protective gear. The high standard of design and workmanship reached in these specialities is well known to our readers, who will doubtless remember that we have from time to time described and illustrated many of the apparatus referred to.

**INSTRUMENTS AND METERS.**—Additional copies of the lists referred to in *ELECTRICAL ENGINEERING*, May 15th, p. 276, have been received from Evershed & Vignoles, Ltd. (Acton Lane Works, Chiswick, W.). A supplementary list dealing with Murday's patent recording ammeters, voltmeters, and wattmeters has been published, and a new list takes the place of that dealing with the "megger" testing sets, while the one dealing with portable instruments has been reprinted.

## A NEW INSULATED TERMINAL

THE Gibson Terminal Co. (149 Strand, W.C.), are introducing a patented insulated terminal, or "tag end," for use with electrical apparatus. The arrangement of this terminal is clearly shown in the three views below. The left-hand view shows the terminal wired complete. To insert the wire the

ebonite sleeve is threaded on to the wire, as shown by the dotted line, and the wire is then passed through the holes in the flattened portion of the brass terminal at the threaded end, as shown in the two sectional views. The ebonite sleeve is then screwed down, the wire is held tight, and a self-acting cord-grip is provided by the thread of the sleeve biting into the insulation. The above drawings are full size.

**Cracking of Insulators.**—Transmission companies in America and Canada have been experiencing considerable trouble with insulators owing to the cracking of the porcelain. This is largely due to expansion differences, and is felt most on strain or dead-end insulators. As a protection against heavy surge over-voltages, says the *Electrical World* (New York), a lateral air path has proved useful for strings of insulators. The ratio of the total dielectric strength of the insulator string to that of the air path is called the factor of safety of the string, and in practice varies from 1:6 to 2:3.

**Magnetic Salvage.**—A large fire which occurred recently in an engineering works at Birmingham was a means of affording a Witton-Kramer magnet an opportunity of demonstrating its powers. The debris contained a considerable amount of iron in the form of screws, nails, bolts, &c., and this was of such value as to warrant salvage operations. A 42-in. Witton-Kramer magnet was rigged up on sheer legs, and after the larger masses of metal had been removed, smaller pieces were shovelled on the face of the magnet, which retained everything magnetic, the residue sliding down a board into a heap beneath. When the face of the magnet became filled, a box was placed underneath and the current switched off, the magnetic "catch" falling into it and then being removed. The work of the Witton-Kramer magnet was so thoroughly done that expectations were more than realised, and over two tons of metal, screws, &c., were salvaged, the bulk of which can be utilised. The magnet in question takes 5 kw., and was constructed by the Witton-Kramer Electric Tool & Hoist Co., Ltd., Witton, for whom the General Electric Co., Ltd., 67 Queen Victoria Street, London, E.C., are the sole selling agents.

### ELECTRIC TRACTION NOTES

In view of complaints that have been made by drivers on the Great Northern Railway that certain mercury vapour lamps gave a light which could be confused with green signal lights, the Westinghouse Cooper Hewitt Co. (80 York Road, King's Cross, N.) inform us that special globes and reflectors can be used near railways by which the appearance of the lamps from a distance is altered, although the characteristic quality of the light for seeing purposes is maintained.

At a Congress of the Franco-British Travel Union on Tuesday evening, an address on the subject of the proposed Channel Tunnel was given by Baron E. d'Erlanger, who referred briefly to the electrical power plant that would be provided for running the trains as well as for lighting. Sir Francis Fox also read a Paper on the engineering aspects of the scheme. He said that the debris from the shields used for driving the tunnels would be carried by electrically-driven belt conveyors to the wagons, which would be removed in trains hauled by electric locomotives. The drainage heading would be excavated by some approved cutter or by Price's electrical digger, as used on the London tube railways. The use of electric traction in the tunnels would simplify the ventilation arrangements, and instead of blowing the air in a direction contrary to the traffic, as is done in long steam-worked tunnels to keep the driver and fireman free from smoke and steam, the air would be blown in the same direction as the train, which would assist and not retard the current. Again, much less air would be required. Reckoning as a maximum a train carrying 500 people every ten minutes, 45,000 cub. ft. of air per min. at a velocity of 6 ft. per sec. should be sufficient. The tunnels, he said, would be lighted throughout by electricity, and a separate and special circuit will be provided, so that in the event of the main traction current failing, the lights in the tunnels will not be extinguished. Carriage lighting would be independent, each vehicle carrying its own store of light. The electric locomotives would replace the steam locomotives on this side at a station at Maxton, just within the Borough of Dover. The main tunnels would consist of two single-track circular tunnels, each of 18 ft. net internal diameter, and thus large enough to accommodate the rolling stock of the British and French main lines, except only their locomotives, for which would be substituted electrical locomotives of ample power to deal with the heaviest trains running upon the main lines. No mention is, however, made of the system of electric traction to be adopted.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A beginning was made last week by the German cable ship *Stephan* in the laying of a new four-core telegraph cable connecting this country with Germany. The laying of the cable was commenced at Mundesley (Norfolk), where, owing to the gentle sandy nature of the fore-shore, no special shore-end is required. It goes to Emden, practically the nearest point in Germany. Here all the German Atlantic and also five Anglo-German cables terminate. The messages will be repeated at the cable stations at each end, i.e., at North Walsham, which is some twenty miles inland, and at Emden. The length of the cable is about 240 nauts. It consists of four conductors, each consisting of thirteen copper strands, the middle one being thicker than the others. The weight of copper is 210 lb. per naut, and the weight of gutta-percha 175 lb. per naut. The cable is laid up in the usual way—each conductor is surrounded by gutta-percha, and over this a layer of brass teredo tape, then jute worming to make the whole

circular, and an armouring of thirteen galvanised iron wires surrounded by a protective coating of tarred hemp. The overall diameter is about 1 $\frac{1}{8}$  in. The cable will, we believe, be worked Hughes at first (twenty-eight words per min.), and later Baudôt single, double or triple duplex (thirty, sixty or ninety words per min. in each direction). The effect will be to put Leipzig into direct communication with this country, and to increase the number of lines at present working between this country and Berlin, Hamburg and other towns in direct communication. Tests are now in progress, but it is not anticipated that the cable will be put into regular service for some time.

In the course of an article in the September issue of *The Central*, Mr. Maurice Solomon compares the different varieties of Leclanche cell at present obtainable. He gives the capacity of the three-pint porous-pot type of cell as 40 ampere-hours (i.e., until the open-circuit voltage is reduced from 1.5 to 0.75), of the quart size at 18 ampere-hours, and of the pint size as 8 ampere-hours. For the sack type he gives the capacity of the three-pint, quart, and one-pint sizes as 100, 75, and 40 ampere-hours respectively, and says that the quart-size sack element is only 50 per cent. heavier than the corresponding porous pot, although it has four times the capacity. About 42 per cent. of the manganese dioxide is used up, compared with 84 per cent. in the porous pot. When size and weight are taken into consideration, the carporous pot and agglomerate block types of cell do not show so high an efficiency as the simple porous pot, in which the grains of depolariser are of the best size.

The inaugural meeting of a new Association, known for the present as "The London Wireless Club," was held in the Westminster City Schools on Tuesday evening, under the chairmanship of Mr. F. Hope-Jones, who explained the objects of the Association. These include the reading of Papers and discussions among members, the formation of a library in club rooms, where, also, an aerial for the purpose of carrying out experiments on new and improved apparatus, is to be available to members. It is also intended that a sub-committee be appointed to judge of the qualifications of candidates for transmitting or receiving licences from the Post Office, and to co-ordinate research. This Department has already signified its approval of the objects of the Association. There are two classes of membership, and the subscriptions are 10s. 6d. per annum for London members and 5s. for country members. Full membership is now limited to those holding licences or having equivalent scientific qualifications, and to wireless operators. The Committee is constituted as follows:—Chairman, Mr. F. Hope-Jones; Vice-Chairmen, Mr. H. F. Brand and Mr. L. McMichael; Hon. Sec., Mr. R. H. Klein (18 Crediton Road, West Hampstead, N.W.); Treasurer, Mr. L. F. Fogarty, and Messrs. W. J. Shaw, V. W. Delves Broughton, W. J. Fry, E. W. Kitchen, F. C. Knight and A. G. Hansard. Arrangements are being made for the renting of club premises at 107 Hatton Garden from A. W. Gamage, Ltd., who will also lend their aerials. Dr. S. P. Thompson has already consented to become one of the Vice-Presidents. There are already nearly 100 members. The next meeting will be held in about a month's time.

At a meeting of the Liverpool and District Amateur Wireless Association, on September 11th, the question of "Receiving Outfits" was discussed, and Mr. Jardine described a new outfit giving very good results, and to a great extent obviating local jamming. Mr. J. T. Thompson, Mayor of Birkenhead, had consented to act as a vice-president of the Association. Mr. Frith exhibited a very compact receiving outfit for field work, contained in a case 8 $\frac{1}{2}$  in. by 1 $\frac{1}{2}$  in. by 5 $\frac{1}{2}$  in., holding inductance, silicon detector, blocking condenser, and a pair of headgear 3,000-ohm telephone receivers. The next meeting will be to-day.

The Directors of the Direct Spanish Telegraph Co. have decided to pay, in addition to the dividend at the rate of 10 per cent. per annum on the preference shares, a dividend at the rate of 4 per cent. per annum on the ordinary shares.

As a result of careful tests at the wireless station of the University of North Dakota, Professor A. H. Taylor suggests

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published September 18th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

16,992/12. **Wireless for Aeroplanes.** C. GRAHAME WHITE and H. FOTHERGILL. To avoid the necessity for storage batteries in aeroplanes and hydroplanes, an A.C. generator is directly connected to the motor driving the propeller. Four figures.

19,118/12. **Motor Meters.** S. H. HOLDEN and CHAMBERLAIN & HOOKHAM. Instead of employing solid brushes in D.C. motor meters of the eddy-current brake type, the armature spindle is inclined so that the commutator dips into mercury at its lower side. An open-coil winding in which one end of each coil is permanently connected to the armature spindle so that only one brush is required is used. Cupro nickel is used for the commutator. An enclosed chamber is provided for the mercury, and arrangements are provided for expelling this when necessary. By means of floats attached to the spindle and immersed in a liquid, the weight on the pivots is reduced. Two figures.

19,585/12. **Ordnance Signals.** A. T. DAWSON and G. T. BUCKHAM (Vickers). For transmitting orders and particulars as to the range and deflection of guns on board ship, &c., a step-by-step receiving motor, a transmitter, and a positive mechanism for effecting the desired indications by current impulses, are described. A spring fly-back for restoring the armature of the receiver after each excitation works with two opposing movable pawl mechanisms in the armature so as to transmit the oscillatory movements to a counting or indicating device, and to de-energise the armature. Thirteen figures.

19,754/12 and 19,771/12. **Cooking Utensils.** A. J. KERCHER. The cooker consists of an inner vessel surrounded by an hermetically sealed space partly filled with water or other liquid, such as oil. A safety vent is provided. The liquid is heated by the element which is in contact with the outer sides of the space where the liquid is, and an external lagging is provided. The inner receptacle is in contact with an exhausted chamber, which, when a certain temperature is reached, is designed so as a diaphragm suddenly buckles, and so works a quick-acting switch in the heating circuit. By these means the temperature of the inner receptacle is kept constant. The spring of the switch may be fixed to the exhausted controlling chamber through a fusible alloy, so that an excessive temperature cannot be reached. Three figures and one figure respectively.

19,825/12. **Trolley Omnibuses.** E. CROSS. Means for effecting connection with tramway rails where these are in existence is provided through pilot wheels or runners on the 'bus. These wheels may be brought into contact with the rails, and they are connected with the steering road wheels, so that, in spite of some deviation of the latter, the rail contacts may still be effective. Additional brush contacts for reverse running may be provided. Two figures.

992/13. **Globes and Reflectors.** G. SCHANZENBACH and C. KNAPP. The specification covers a reflector in which the light source is hidden from the observer. It is composed of separate translucent lamellæ, while between each, and extending from the apex of the enclosure, and preferably curved, clear glass surfaces are provided. These are radial to the light source, and are as perpendicular as possible to the light reflected to them from the obscured lamellæ. Cleaning is said to be facilitated by this design. Four figures.

4,479/13. **Cooking Utensils.** J. MANN. Ceramic vessels provided with heating coils are made by applying the coils to the outside, and then an outer coating of ceramic material is applied so as to form a permanent casing. Four figures.

6,648/13. **Commutators.** SIEMENS DYNAMO WORKS (*Siemens-Schuckert*). To prevent brush sparking due to the projection above the segments of the insulating material, the edges at the surface of the commutator are left free, so as to yield under the brush pressure. Three figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** SIEMENS-SCHUCKERTWERKE [Regulation of the light intensity] 17,086/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** BECKER [Protection of circuits against high frequency oscillations] 12,908/12; B. T. H. Co. (*G. E. Co., U.S.A.*) [Motor control systems] 20,662/12 and 20,744/12; [Resinous compositions] 25,776/12 and 24,059/12; ST. HELENS CABLE CO. and EVANS [Insulating gloves] 5,242/13; BECKER [Prevention of excess pressure in A.C. circuits] 19,029/13.

**Dynamos and Motors:** ROUZET [A.C. motors] 12,687/12; BERDON [D.C. dynamos] 20,225/12; ATELIERS DE CONSTRUCTIONS ELECTRIQUES DU NORD ET DE L'EST [Alternators] 25,207/12.

**Electrochemistry:** MARINO [Electrolytic pickling] 20,180/12.

**Heating and Cooking:** DIGBY [Heating apparatus for buildings and vehicles] 26,256/12; ALBRECHT [Heating apparatus] 26,347/12; WEAVING and the FERRANTI Co. [Switch arrangements for heaters] 12,935/13.

**Ignition:** SCHULTZ [Regulators for igniting apparatus] 8,758/13; GORDON and WRIGHT [Igniting and unlocking miners safety lamps] 13,694/13.

**Incandescent Lamps:** B. T. H. Co. (*G. E. Co., U.S.A.*) [Filament manufacture] 27,433/12.

**Instruments and Meters:** SIEMENS-SCHUCKERTWERKE [Meters, meter systems, and controlling relays] 26,439/12; ELSTER [Meters] 3,466/13; HARTMANN & BRAUN [Direct measurement of small differences in resistance] 8,602/13.

**Switchgear, Fuses and Fittings:** CHARLES [Tumbler switches] 22,477/12; VAN KERCKHOVEN [Combined dynamo regulators and switches] 1,512/13; CUNNINGTON [Contact for bells, alarms, &c.] 7,755/13; WALTER and DISPLAYER Co. [Automatic control of motors for compressing fluids in cylinders] 12,218/13.

**Telephony and Telegraphy:** DANNENBERG [Ear and mouthpiece protectors for telephones] 30,111/12; SIGNAL GES. [Wireless] 3,246/12; ROGERS-JENKINS [Pole stay-wire guards] 9,869/13.

**Traction:** JENNINGS [Railway signalling] 16,678/12; PURVIS and GRITMAN [Railway systems] 26,344/12; STOCKDALE [Railway signals] 16,920/13.

**Miscellaneous:** MASCORD [Massage apparatus] 19,661/12; SEVERY and SINCLAIR [Vibratory musical instruments] 19,869/12 and 16,860/13; GARDNER [Gyroscope] 20,135/12; WORTMANN [Agricultural machinery] 20,185/12; PARKER [Secondary clocks] 24,274/12; JORIS [Lamps for mines] 28,816/12; CLOES [Safety signalling for mines] 2,546/13; Soc L'ECLAIRAGE ELECTRIQUE [Electric driving mechanism for spindles, flyers, &c., in textile machinery] 3,759/13; STEVENS [Fire-alarms] 11,218/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos, Motors, and Transformers:** RUBEL [Iron alloy] 18,171/13; ALEXANDERSON [Polyphase commutator motors] 19,517/13.

**Telephony and Telegraphy:** HULL [Selecting apparatus for telephones] 19,249/13; SIEMENS & HALSKE [Calling on party-lines] 19,271/13; [Circuits for automatic and semi-automatic telephone systems] 19,518/13.

**Miscellaneous:** MAY [Increasing the strength of magnets] 7,898/13; ASH [Rat traps] 19,496/13.

### Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** VERITAS Co. and F. S. WORSLEY [Self-sustaining winches] 13,085/06.

**Dynamos, Motors, and Transformers:** B. T. H. Co. and K. AHLQVIST [Flexible coupling for turbo-generators] 11,704/05.

**Electrochemistry:** E. ALBERT [Electrotype] 11,527/05.

**Heating and Cooking:** C. G. NORBS and J. E. ROSENTHAL [Oil-filled radiator for heating buildings] 12,352/08.

**Incandescent Lamps:** B. T. H. Co. (*G. E. Co., U.S.A.*) [Machine for cementing caps to bulbs] 12,731/06; H. KÜZEL [Supports for tungsten filaments] 15,798/07.

**Instruments and Meters:** E. WESTON and A. O. BENEFKE [Sensitive recording motor meter] 12,463/02; [Electrical registration of the readings of pressure gauges, ships' compasses, &c.] 12,469/02; [Returning pointer of a recording instrument to zero] 12,476/02; S. EVERSHED and EVERSHED & VIGNOLES [Counting trains] 12,701/02.

**Switchgear, Fuses, and Fittings:** B. T. H. Co. and A. S. CURRITT [Magnetic blow-outs for fuses, &c.] 12,340/04; R. P. JACKSON [Pressure controller for transformer secondary] 1,391/05.

**Telephony and Telegraphy:** H. S. WARREN and G. A. CAMPBELL [To prevent loss by reflection of waves, subscribers' telephone circuits are connected to loaded trunk lines through graduated impedances] 12,476/03; BRITISH WESTINGHOUSE Co. (*American Westinghouse Co.*) [Compensating disturbing effects of neighbouring high-pressure A.C. traction circuits, &c.] 12,952/07; H. ROOST [Indicating duration of telephone calls] 12,336/08.

**Traction:** SIEMENS BROS. and A. SIEMENS [Electromagnetic detent for signalling mechanisms] 12,785/02; W. H. WHERRY [Rail bonding] 12,458/03 and 12,461/03; G. WESTINGHOUSE [Brake system with electrically-controlled valves] 12,374/04; W. R. SYKES [Motor-operated semaphore signals which are also held off electromagnetically] 12,751/04.

**Miscellaneous:** S. LAKE [Submarine control] 11,788/05; C. W. KAYSER and J. E. ROBINSON [Clutch release] 26,558/07; R. BRIGHT and J. M. W. WRIGHT [Advertising] 12,085/08.

# THE I.C.S. SCHOOL OF ELECTRICAL ENGINEERING

## ADVISORY BOARD :

**Mr. A. H. LAW,**

B.A.I., Assoc.M.Inst.C.E., M.I.E.E.,

Director of Electrical Department, Messrs. C. A. Parsons, Ltd.,  
Newcastle-on-Tyne.

**Mr. T. E. GATEHOUSE,**

F.R.S.E., A.M.I.C.E., M.I.E.E., M.I.M.E.,

Editor of the *Electrical Review*.

**Mr. H. P. BROWN,**

Chief Engineer, Central Telephone Exchange, London, E.C.

**Dr. MAX KAHN,**

Chief Electrician, The Brush Electric Engineering Co., Ltd.,  
Loughborough.

## Specialized Instruction

**S**PECIALIZATION is the secret of progress. In every walk of life, the man who can do some one thing better than any of his comrades can do it, is sure to receive a large salary. While the value of broad training is not questioned, many whose time for study is limited wisely conclude that it is better to try to learn all about some one thing than to attempt to learn something about everything. Others, having more or less general knowledge of electrical work, desire to perfect themselves in some one branch that from its financial rewards or its environment appeals particularly to them. The I.C.S. therefore, in addition to their Complete Electrical Engineering Course, offer Special Electrical Courses.

### No Unnecessary Subjects Included

Great care has been given to the preparation of these Courses, and the Papers contain the best and most useful information on the subjects covered. The student receives just the training he requires to enable him to become one of the fully competent, intelligent, and resourceful men so much needed in all departments of electrical work.

### Five Combination Courses

To those who desire a more extended treatment of steam engineering subjects than will be found in the Courses in the list below, we offer four combination Courses, namely :

**Steam Electric.                      Advanced Electric Traction.  
Advanced Electric Lighting.      Engine & Dynamo Running.**

Also, for those who are concerned with electric-power plants in which gas instead of steam is employed, we offer the **Gas-Electric Course.**

Anyone enrolling in one of these Courses will increase his opportunities of obtaining the most lucrative posts in connection with steam or gas-driven electric power and lighting plants. These five Courses are made up of Instruction Papers selected from our Electric Lighting and Traction, Gas-Power Operating and Steam-Engineering Courses. These Papers are the most valuable and the most modern engineering books in their particular line.

Men who have completed one of these combination Courses are doubly efficient in any position they may take up, and are in great demand in the steam engineering and electric power and lighting professions. In the Electrical Engineering Syllabus will be found detailed descriptions of the above-mentioned Courses.

## The Choice of a Course of Study

If you wish for a thorough general knowledge of lighting, power and traction plants, and the design, construction, and management of all kinds of electrical apparatus and machinery, write for prospectus of

### The Complete Electrical Engineering Course.

If you are a mechanical engineer and wish to acquire a wide knowledge of electricity refer to

### The Electrical Course.

If you desire to undertake the erection and management of electric lighting and traction plants, refer to

### The Electric Lighting and Traction Course.

If it is your ambition to obtain a responsible position in a power station or take charge of a steam-electric plant of any description, refer to

### The Steam-Electric Course.

If you wish to qualify for a position to run a self-contained electric light installation driven by gas engines, refer to

### The Gas-Electric Course.

If you wish to become a telephone engineer, refer to

### The Telephone Engineering Course.

**The International Correspondence Schools also give sound, practical training in Gas-Power and Motor-Engineering, Steam Engineering, Boiler Engineering, Mechanical Engineering, Draughtsmanship, Building in all its branches, Mining, &c.**

**For full syllabus of any course write, naming the subject in which you are interested, to International Correspondence Schools, Ltd., 115d, International Buildings, Kingsway, London, W.C. Please use our FULL address so as to avoid delay.**

ABROAD:—Adelaide, Brisbane, Buenos Ayres, Bulawayo, Calcutta, Christchurch (N.Z.), Durban, Hobart, Johannesburg, Launceston, Melbourne, Perth, Sydney.

that the varying absorption of signals due to atmospheric conditions is probably caused by a sun-created conductivity close to the earth's surface (below the normal cloud layers). According to the *Electrical World* (New York), this solar ionisation is insufficient to account for the tremendous changes in transmission distances noted from night to night, and the observations of Professor Taylor might be further interpreted by considering that after a cloudy day the earth's surface retains more of the moisture deposited nightly, and so permits the passage of radiated waves and their accompanying earth currents with smaller conduction losses.

Rumours that the Marconi Co. is intending to increase its capital have been current recently, but no definite information has been vouchsafed by the Company.

The West India Committee announces that wireless telegraphy has been successfully established in the Bahamas. The station is at Fort Charlotte, Nassau. The quenched-spark system has been adopted.

## LOCAL NOTES

**Airdrie:** *Electrical Exhibition.*—The Coatbridge & Airdrie Electric Supply Co. has promoted an exhibition of electrical apparatus in the town, in conjunction with the Carron Co., which has recently been giving much attention to electric cooking apparatus.

**Flintshire:** *Electric Lighting.*—A scheme for giving a supply of electricity in the industrial districts of Queen's Ferry, Connah's Quay and Shotton is under consideration.

**Manchester:** *Wages in Electrical Trade.*—The Manchester section of the Electrical Trades Union has passed a resolution to give electrical firms in Manchester a month's notice failing an advance in wages of from 9d. to 10d. per hour.

**Market Weighton:** *Electric Lighting.*—Mr. C. Pullan, Electrical Engineer, Bradford, proposes to form a company to supply this district with electricity.

**Rawtenstall:** *Street Lighting.*—The electric lighting of all the streets in the town is to be considered.

**Rothsay:** *Electrical Extensions.*—Mr. J. A. Robertson, the Greenock Burgh Electrical Engineer, has been preparing a scheme for working a refuse destructor in conjunction with the electricity undertaking.

**Stirling:** *Proposed Purchase of Electricity Undertaking.*—The terms, offered by Messrs. Balfour Beatty & Co. for taking over the Corporation's electricity undertaking, and converting their existing horse tramways to electric traction, are the payment of £28,642 to cover the unredeemed debt on the undertaking, £2,250 to refund the Council the difference in accumulated debit balances up to the year 1908, and the credit balance carried to reserve since that date, and in addition the sum of £2,000, making a total of £32,892. A reduction in the prices for current is also promised.

**Tyldesley:** *Inauguration of Electric Supply.*—The bulk supply which is being given by the Lancashire Electric Power Co. was inaugurated last week, and the occasion was celebrated by a dinner given by the Power Co. to a large number of district representatives and others.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Carlisle.**—A L.G.B. inquiry was held last week concerning a loan of £7,500 for the electricity undertaking.

**Grimsby.**—Sanction has been given to the borrowing of £16,000 for extensions at the electricity works.

**Keighley.**—Two miles of overhead transmission line in duplicate for 6,600-volt three-phase 50-cycles. Borough Electrical Engineer. October 1st.

**Littleborough.**—An expenditure of £4,000 upon the electricity undertaking is contemplated.

**Moffat.**—Details of an electric lighting scheme at an estimated cost of £8,000 has been placed before the Council.

**Preston.**—The Guardians have decided to purchase a 250-kw. generating set.

**Salford.**—Rotary-converters. Borough Electrical Engineer.

**Walthamstow.**—L.T. feeder cable. Borough Electrical Engineer. October 8th.

**Wigan.**—A L.G.B. inquiry was held last week concerning a loan of £6,700 for electrical extensions.

**Worthing.**—Diesel engine generating set. Borough Electrical Engineer.

## Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Aberdare.**—New police station.

**Bristol.**—Labour Exchange. H.M. Office of Works, Storeys Gate.

**Carlisle.**—New school.

**Chesterfield.**—Sanatorium. Architects, Messrs. W. H. Ward, 30 Paradise Street, Birmingham.

**Dunfermline.**—Extensions to central library (£14,000).

**Greenock.**—New school.

**High Wycombe.**—New Grammar School.

**Kilmarnock.**—Extensions to infirmary (£14,000).

**Limavady.**—New court house.

**Limerick.**—New theatre. Architect, J. O'Malley, 10 Glentworth Street.

**London.**—New Science Museum, South Kensington.

**Sheffield.**—A Committee has been appointed by the Corporation to consider the lighting of all schools by electricity.

**Torquay.**—Extensions at St. Luke's schools. Architects, Appleton & Son, 23 Abbey Road.

## Miscellaneous

**Australia.**—A 15-ton electric crane for the Victoria Railway Commissioners. Further particulars, 73 Basinghall Street, E.C.

The date for receiving tenders for the haulage engine and electric motor and equipment, referred to in our last issue, has been extended to November 12th.

The Melbourne Electric Supply Committee requires 6,700 yds. of lead-covered cable, seven single-phase transformers, and 33,300 incandescent lamps. Further particulars from Messrs. McIlwraith, McEacharn & Co., Biliters Square Buildings, E.C.

**Dundee.**—Overhead equipment, bonds and conduits. General Manager Tramways Department.

**New Zealand.**—Telephone instruments and accessories are required in connection with the Lake Coleridge power scheme. The Wellington Council requires a switchboard and accessories. Further particulars, 73 Basinghall Street, E.C.

## TENDERS RECEIVED AND ACCEPTED

**Cardiff.**—Fifty tenders have been received for the extension of the plant in the Roath Power Station. These are now under consideration by Mr. A. Ellis, the Borough Electrical Engineer.

**London:** *London Electric Supply Corporation.*—A 13,200-k.v.a. Richardson's-Westgarth-Brown, Boveri set has been ordered. This set, which will be required for the extra load in consequence of the extensions of the London Brighton & South Coast Railway's electrified lines, will consist of a Richardson's-Westgarth turbine driving two 6,600-k.v.a. single-phase alternators at 1,600 r.p.m.

**Hammersmith.**—The tender of Messrs. Langdon Davies & Co. has been accepted for a 2-h.p. motor at £15 15s.; a 3-h.p. motor at £17 5s., and a 9-h.p. motor at £29 16s. Delivery in three weeks. Messrs. Siemens Bros. Dynamo Works, T. Harding Churton & Co., the British Westinghouse Co. also tendered, but their prices were not only higher, but the period for delivery was considerably longer.

FOR  
**STEAM JOINTS**  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

**Hackney.**—The following tenders have been received for the H.T. ring main conduits in connection with the extensions now being carried out:—Foote & Milne, £16,019; William Griffiths, £20,773; Dick, Kerr & Co., £22,835. The Electricity Committee, in bringing these tenders before the Council, pointed out that Messrs. Foote & Milne have not executed any work exactly of this character, their experience having chiefly been with large installation work, and with cables laid in the solid or armoured systems. They appeared, however, to be a good firm, as they were constantly at work for the Admiralty and War Office, and could point to some very large contracts executed for the Government. In recommending that the contract should be placed with this firm, the Committee states that it has provided for the usual sureties for the sum of 10 per cent. on the total value of the work contemplated, viz., £16,019, but reserves the option of placing orders for one-quarter, one-half, three-quarters, or the whole of the work. It seems to be the intention, from the report, to order the work to be proceeded with in two sections, and in the event of the satisfactory completion of these sections the contractors will be ordered to proceed with the remaining two sections.

The following tenders have been received for substation plant:—G.E.C., £6,991 10s. (Westinghouse transformers) and £6,691 10s. (Brush transformers); British Westinghouse Co., £7,006; Siemens Bros. Dynamo Works, £7,051 (Siemens transformers) and £6,931; B.T.-H. Co., £7,159 (Brush transformers), £7,555 (Westinghouse transformers), £7,793 (British Electric transformers), £6,999 (Brush transformers and step starting), £7,395 (Westinghouse transformers and step starting), and £7,658 (British Electric transformers and step starting); Bruce Peebles, £8,166 (La Cour converters); Vickers, £8,189 (Brush transformers); E.C.C., £8,436 (motor generators). With the exception of Messrs. Bruce Peebles, who, of course, quote for La Cour converters, all the tenderers specify rotary-converters. In view of the fact that La Cour converters are used at Poplar, Stepney and Stoke Newington, and the possibility in the not distant future that the East London Boroughs will be linked up, the Committee recommends the adoption of this type of machine.

For substation switchgear and connections the following tenders were received:—Johnson & Phillips, £4,748; G.E.C., £5,187; E.C.C., £5,632; A. Reyrolle & Co., £5,759; Siemens Bros. Dynamo Works, £5,778; B.T.-H. Co., £5,909; British Westinghouse Co., £6,212; Ferranti, Ltd., £6,832; Switchgear & Cowans, £5,985. In bringing these tenders to the notice of the Council, the Committee pointed out that with the exception of Messrs. Ferranti all the tenderers have submitted drawings which are not at all clear either as to details or general arrangement, or both. On the other hand, Messrs. Ferranti's tender is a high one. The Borough Electrical Engineer, however, has finally come to the conclusion that the Council will be safe in accepting the tender of Messrs. Johnson & Phillips.

The Edison & Swan United Electric Light Co., Ltd., advise us that they have recently secured the following important contracts for Royal Ediswan Lamps:—British Admiralty, G.P.O., British L.M. Ericsson Manufacturing Co., and the United River Plate Telephone Co.

### APPOINTMENTS AND PERSONAL NOTES

We are informed that by arrangement with the Directors of Messrs. Siemens Bros. Dynamo Works, Ltd., Mr. E. P. Barfield will sever his connection with the Dalston Lamp Works at the end of the present month. He will, therefore, take up his new appointment as General Commercial Manager with the Edison & Swan United Electric Light Co. early next month.

The Rhondda Urban District Council have appointed Mr. James Bowman as Engineering Clerk of Works, to supervise the erection of their refuse destructor and electric generating works.

Mr. W. H. Johns, Assistant Engineer to the Birmingham Gasworks, has been appointed Electrical and Gas Engineer to the Malvern U.D.C. in succession to Mr. J. Rendell Baker, who, as we announced last week, has gone to Mansfield.

A proposal to increase the salary of Mr. R. L. Horsfield, Tramway Manager at Walsall, from £400 to £500 per annum by half-yearly increments of £25, has been rejected by the Council.

Jointers are wanted for electrical work in the South of Scotland. (See advertisement on another page.)

An assistant telegraph engineer is required by the Great Peninsula Railway. Applications to R. White, Consulting Engineer, 3 Victoria Street, S.W.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £77 15s. to £78 5s. (Last week, £77 10s. to £78.)

**Lea Recorder Co., Ltd.**—Mr. W. H. Lund (Caxton House, Westminster, S.W.) has been appointed the representative for London and the south of England of the Lea Recorder Co., Ltd. The Company has been awarded a gold medal at the Ghent Exhibition for its standard integrating machine for the measurement of flowing water. The machine is described in two circulars.

**Advertising and Salesmanship.**—A technical session on the arts of advertising and salesmanship was commenced yesterday at the Birmingham Y.M.C.A. (Dale End), by the Forward Publicity Co. (Temple Row, Birmingham). Lectures are given every Wednesday evening (advanced) and Thursday evening (elementary) by Mr. A. C. Huckstepp, Principal of the Company.

### COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Crompton & Co.**—A statutory meeting of the reconstructed company was held last week, when it was announced that the whole of the preference shares offered have been allotted, and the reconstruction of the company carried out without any interruption to business. The orders since April 1st, when the new company took over the business, have shown a considerable increase compared with the previous year.

**British Westinghouse Co.**—The capital reorganisation scheme which has been promised for some time has now been placed before the shareholders. It is recommended that a reduction to the extent of £725,000 be made, of which £225,000 will be devoted to writing down patents and goodwill to £150,000. The balance of the reduction, together with the balance at the credit of profit and loss account on December 31st last, will be devoted to the depreciation of buildings, plant, machinery, and investments, the writing off of the expenses of the issue of prior lien debentures, and the loss sustained in connection with the Lot's Road turbine contract, which has now been definitely fixed at £52,050. To effect this reduction in capital, £1 per share will be written off the 500,000 preference shares, and £5 per share off the 75,000 ordinary shares. On the other hand, in order to maintain the same relative position of the two classes of shares as it stood at the incorporation of the company, it is proposed that the dividend on the preference shares shall be increased from 10 to 15 per cent., and on the ordinary shares from 12 to 30 per cent., the division of any surplus profit between the two classes of shareholders remaining as at present, viz., one-fourth among the preference, and three-fourths among the ordinary shares.

### NEW COMPANIES

**SANDBANKS RAILLESS ELECTRIC CAR CO.**—Registered by Jordan & Son, 116 Chancery Lane, W.C. Capital £1,000.  
**CLONAKILTY ELECTRIC LIGHT & POWER CO.,** 45 Sovereign Street, Clonakilty (Cork). Capital £2,500.

Telephone No.: 5509 Holborn.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

## SUMMARY

OWING to pressure on our space we have been obliged to omit our usual fortnightly cartoon this week.

THE new horizontal Diesel engines, one of the four-stroke and one of the two-stroke type, which form the latest extensions of the plant at the Kingston Electricity Works, were inaugurated last Friday. (Page 552.)

A WELL-CONSTRUCTED steel reflector combined with a lampholder, a new dimming lampholder, a new pattern of adapter, and other fittings are described on page 554.

SOME of the temperature limits for the rating of electrical machinery agreed upon by the International Electrotechnical Commission are published. (Page 554.)

AN increase of about 250 per cent. in the number of electric safety lamps in use in mines during 1912, compared with 1911, is shown by the reports of the Government District Inspectors. Satisfactory increases in the number of electrically-driven coal-cutters and in the applications of electricity generally are also shown. (Page 555.)

A HOME OFFICE order requires the use only of approved patterns of safety lamps in mines, and gives particulars of several electric lamps which are permitted. (Page 555.)

EXPERIMENTS carried out by Professor Thornton relating to gas and coal-dust explosions indicate that the dust is the principal and the gas the auxiliary agent. (Page 556.)

THE Home Office inquiry into the fatal fire which occurred at the Cadder Pit a month ago has been held.

There was no evidence to show that the fire was due to the electrical installation, although this had at first been suspected. (Page 556.)

IN connection with a Home Office prosecution under the Coal Mines Act, the ingenious plea was raised that an electrician was only liable to "examine" the plant under the Special Rules, and was not personally liable for faults in construction or for failure to keep in repair. (Page 556.)

AN interesting automatic telfer equipment in a gold mine is illustrated and described. (Page 557.)

A VISUAL signal indicator for mine shaft and haulage signalling is illustrated. (Page 557.)

A SHORT report appears of the discussion on Mr. Frick's paper on electric steel refining at the Brussels meeting of the Iron and Steel Institute. (Page 559.)

THE specifications published by the Patent Office last month of interest to mining electrical engineers and metallurgists include two dealing with miners' safety lamps, one with shaft signalling, and one with the production of the alkali metals by electrolysis. (Page 559.)

THE Patent Office last week published specifications by the B.T.-H. Co. dealing with metallised carbon filaments, the control of motors and motor generators, and the production of infusible moulded insulators. R. Weaving and the Ferranti Co. describe in a patent specification how two heats may be obtained from two heating elements by the use of two single-pole switches. The other specifications include one for a single-phase commutator motor by L. Rouzet. (Page 560.)

THE design of single lamp dimmers is dealt with in our Questions and Answers column. (Page 561.)

SOME protected hot-bar heating elements and a new design of grill are illustrated. (Page 561.)

MARCONI'S Wireless Telegraph Co. has acquired the Goldschmidt patent rights.—The Post Office has issued a new regulation as to portable wireless sets. (Page 562.)

THE Municipal Tramways Association held its annual conference in Sheffield last week, when various matters relating to tramway management were discussed. The unfair competition of motor omnibuses received considerable attention. There is a possibility of the Hove trolley bus scheme being abandoned. (Page 562.)

THE Board of Trade has at last sanctioned the transfer of the Cromer electricity undertaking to Messrs. Edmundsons'.—There is a dispute between the Bury Corporation and the Lancashire Electric Power Co. with regard to a supply in bulk to Heywood.—It is proposed to shut down the smaller power stations belonging to the Stoke-on-Trent Corporation.—A L.G.B. inspector has severely criticised the Leeds Electricity Department for having such a small reserve fund.—The Manchester Corporation has acquired a site for a 100,000-kw. power station.—There is a suggestion that the Hove Corporation shall hand over to the Brighton Corporation the working of the local electric

supply company's undertaking recently acquired. (Page 563.)

SANCTION to the following loans has been received:—Swansea, £40,000; Bridlington, £3,000; Stalybridge, £9,200. Inquiries have been or will be held as follows:—Carlisle, £12,334; Burnley, £36,227; Bacup, £2,800; Leeds, £168,000. Cable is required at Haslingden; a 2,000-kw. generating station at South

Shields; metallic filament lamps at Birkenhead; and electrical fittings in Johannesburg. (Page 563.)

THE capital reorganisation scheme of the British Westinghouse Co. has been passed.—The Victoria Falls & Transvaal Power Co.'s station will have a capacity of 265,000 h.p. by 1915. Mr. A. E. Hadley has reported very favourably upon the Company's power transmission system. (Page 564.)

## DIESEL ENGINES AT THE KINGSTON ELECTRICITY WORKS

THE new extensions of plant at the Kingston-upon-Thames Electricity Works, which take the form of alternators driven by Diesel engines, were formally inaugurated on Friday last. The Mayor, Councillor C. H. Burge, F.I.C., presided, and a number of visitors enjoyed his hospitality. Mr. J. E. Edgcome (Borough Electrical Engineer), under whose supervision the extensions have been carried out, explained the features of the new plant.

The two sets that have been installed are somewhat different in design and are for somewhat different purposes. One was required to have the maximum possible economy in fuel consumption, as it was intended to be run every day at times of light load, so that the

being of the horizontal type, which, however, has been fully standardised by its makers on the Continent. Although, of course, occupying relatively more floor space than the vertical type more familiar to us, the horizontal design has important advantages in the way of accessibility, notably in the possibility of drawing out the pistons without disturbing the valve gear or breaking the joints in the cylinder-head. In the ordinary land vertical type this cannot be done, although in some of the marine pattern Diesel engines with cross-heads it is possible. Some interesting comparisons will be able to be made between the fuel consumptions of the two types of engine, but as they have only been running on regular load for a few weeks, no figures

FIG. 1.—FOUR STROKE HORIZONTAL DIESEL ENGINE.

steam plant could be entirely shut down, while in the other case it was more important that the economy should lie in the direction of capital cost than fuel consumption, as it was to be used mainly as stand-by plant, so as to obviate the necessity of having extra boilers waiting with their fires banked, and to assist generally at times of heavy load. It is particularly interesting to realise these two distinct fields of usefulness in which Diesel engines are eminently suitable as auxiliaries to steam plant for the improvement of the over-all efficiency of the station.

With these requirements in view, it was decided that the day-load engine should be of the four-stroke cycle pattern, and the stand-by engine of the slightly less efficient but cheaper two-stroke design. Both engines were supplied by the M.A.N. Co. (Maschinenfabrik Augsburg-Nürnberg A.G.), and strike a note of novelty, as far as this country is concerned, in

are yet available. It may be opportune, however, to give the consumptions guaranteed and realised on the tests. The four-cycle set is guaranteed to take 0.603 lbs. of fuel oil per kw.-hour on full load, 0.64 lbs. on  $\frac{3}{4}$  load, 0.7 lbs. on  $\frac{1}{2}$  load, and 1.14 lbs. on  $\frac{1}{4}$  load. The corresponding figures for the two-cycle engine are 0.64 lbs. per kw.-hour on full load, 0.68 on  $\frac{3}{4}$  load, 0.83 lbs. on  $\frac{1}{2}$  load, and 1.25 lbs. on  $\frac{1}{4}$  load. All these figures were subject to a margin of 5 per cent.

The four-cycle engine is rated at 400 h.p. at 192 r.p.m., and has four horizontal cylinders, with their cranks covered in, two on either side of the flywheel alternator, and all controlled by a single governor. The fuel injection valves are of the same pattern as those used in the ordinary vertical Diesel engines, but they are placed horizontally in the centres of the cylinder heads and are worked by a cam-shaft running at the top and bottom of the cylinders respectively, are across the cylinder ends. The air inlet and exhaust valves,

very much of the pattern usually adopted in large gas-engine practice, actuated by a side cam-shaft, rocking levers and linkages, and, indeed, there is a good deal in the design of the engines which reminds us that it is founded to a large extent on the lengthy experience of the makers in the building of large gas engines. The valves and their seatings are particularly easy to remove for cleaning, and the whole engine strikes us as being of simple, straightforward and robust design. The flywheel, with the rotor of the alternator, weighs over 25 tons, and the engine runs at 192 r.p.m.

The alternator is of the standard slow-speed revolving field pattern, with outwardly radiating poles, of Siemens Bros. Dynamo Works, Ltd., rated at 270 k.w. at 2,100 volts single-phase, at the peculiar frequency of 77 cycles (that of the original twenty-year-old alternators in the station). The exciter is mounted on one end of the shaft and the compressor on the other.

The two-cycle engine, which is rated at 500 h.p., has two working cylinders, both on the same side of the flywheel, and a scavenging pump, which, at the end of the outward stroke, after the working piston has uncovered a ring of ports in the cylinder walls, sweeps out the products of combustion and fills the cylinder with air to be compressed by the next inward stroke. Thus each cylinder gives one

The main water-cooling supply is obtained from a 5,000-gallon tank on the roof, to which water from the river is pumped by a pair of centrifugal pumps driven by single-phase motors from the ordinary mains. Two large fuel storage tanks, each large enough to contain 60 tons of fuel oil, equivalent to a two or three months' supply, have been provided, and fuel is pumped into these from oil tank barges on the river by electrically driven pumps; another set of pumps is also provided to take the fuel as required to the working tank, from which it passes through filters to the engines. The exhaust from both engines is led through silencers to the main chimney shaft of the station.

Both sets are regularly paralleled with the steam-driven plant, which consists of old-pattern Siemens air-core revolving armature disc-type alternators, some of which have now been running about twenty years. The extensions also include a new 24-panel switchboard constructed by Switchgear & Cowans, Ltd. (Springfield Lane, Salford, Manchester), which contains the necessary generator and synchronising panels for the new Diesel sets, and sixteen feeder panels to which feeders formerly connected to the old board have been transferred. The actual high-tension gear

FIG. 2.—TWO STROKE HORIZONTAL DIESEL ENGINE.

explosion for every revolution. The scavenging valves occupy similar positions to the inlet and exhaust valves of the four-cycle engine, and in the gear operating them many of the same standard parts are used. The cylinders are of approximately the same size as those of the other engine, but owing to the greater heat developed by the more frequent explosions, more cooling is necessary, and the pistons have to be water-cooled, which is not the case with the four-stroke engine. The water for this purpose is led in by the jointed elbow tube arrangement, familiar in large horizontal gas engines, and is supplied by special electrically-driven pumps separately from the main cylinder cooling circulation system. Lubrication in the case of both engines is from pumps driven off the cam-shaft. The alternator is of the same pattern and is rated for the same output as is that driven by the other engine.

The set of compressed-air receivers or "bottles," for the two engines comprises two starting and one blast receiver for each engine, but they are arranged so that any bottle can be connected to either engine for either purpose. The compressors on both engines are of the two-stage pattern with water jacketed intercoolers. To ensure absence of vibration, the two engines are mounted on one massive foundation block consisting of a block of concrete 60 ft. long by 20 ft. wide by 11 ft. 6 in. deep.

is in cubicles behind the board, and the oil switches are worked by hand-operated remote control from the grey marble operating panels on the switchboard gallery. Overload trips are fitted to all the feeder switches, and the generator switches are also provided with reverse current releases.

The operating panels are provided with automatically-controlled coloured indicator lamps, which show the position of each switch. The bus bars are contained in stoneware troughs running the full length of the back of the board. The cells for the high-tension gear belonging to each panel are of moulded "stone" with iron doors. These are immediately below the bus bar troughs, and the connections are taken through porcelain tubes. Elaborate mechanical interlocking of the doors, switches, &c., renders access to any live metalwork absolutely impossible. An earthing bar runs below the switchboard, where the alternator field rheostat are also placed, surrounded by expanded metal screens.

We should not conclude without a word of thanks to Mr. J. E. Edgcome (Borough Electrical Engineer) for special facilities for inspecting the plant, and to the M.A.N. Co. for kindly putting at our disposal the photographs from which our illustrations are reproduced.

## SOME NEW "BENJAMIN" FITTINGS

THE works of the Benjamin Electric Co., in Roseberry Avenue, have been considerably enlarged during the past six months, and are now, we are informed, capable of turning out over 50,000 reflectors a year in addition to the Company's other manufactures; they also accommodate the designing and engineering staff and a laboratory equipped with the necessary testing instruments in connection with the work of scientific illumination which they carry out.

FIG. 1.—STEEL REFLECTOR COMPLETE WITH LAMP HOLDER.

FIG. 2.—STEEL REFLECTOR, SHOWING LAMP HOLDER IN SECTION. (One third size.)

FIG. 3.—BENJAMIN REFLECTOR FITTING WITH LAMP HOLDER FOR OUTDOOR USE.

FIG. 4.—A "MARBELLA" OPAL REFLECTOR.

FIG. 5.—DIMMING LAMP HOLDER. (Half full size.)

FIG. 6.—"BEN-GRIP" ADAPTER. (About two-thirds full size.)

Several of the Company's newest specialities, designed principally for works and shop lighting, were shown us on the occasion of a recent visit to their showrooms at 117 Victoria Street, S.W. The Benjamin steel reflectors are now made up complete with the "Benco" lamp-holder. The reflector is shown in Fig. 1, and Fig. 2 is a drawing to scale showing the lampholder in section. It is a thoroughly sound mechanical job with large porcelain insulating surface, and should be in every way preferable to the ordinary shade-carrier lamp-holder. A pattern with the addition of a lever switch is shortly to be placed on the market also. The reflector itself is of substantial thickness and weight, and is aluminium plated inside. Four shapes are made, the "extra-extensive," "extensive," "intensive," and "focussing," giving the illumination which their names imply. Fig. 3 shows the "Benjamin Reflector Fitting," intended for outdoor use and still harder usage. It is of white enamelled steel, is all in one piece, and also contains its own lamp-holder on the same principle as the one illustrated in Fig. 2. This pattern is largely employed on the Underground Railways of London.

Fig. 4 is one of the pleasing designs of the new "Marbella" Opal Reflectors, which were introduced by the Company last month. They may be used with advantage as a substitute for the ordinary conical opal shade, and they are not unduly expensive.

Two of the miscellaneous specialities of the Company are the dimming lamp-holder (Fig. 5) and the "Ben-grip" adapter (Fig. 6). The lamp-holder contains the dimming resistance, and on pulling one of the cords a simple rubbing contact brush within a brass sleeve covering the resistance is rotated and inserts the resistance in circuit in several steps. As the collar leaves a fair air-space above and below it, the holder should not get unduly warm. The adapter, which is made of hard insulating composition, is so designed as to grip the flex when screwed up, so that there is no strain on

the terminals; its contacts are long and oval shaped, an important point not always observed in the construction of lamp-holder adapters.

## RATING OF ELECTRICAL MACHINERY

WE are now able to give the salient points in regard to the temperature limits adopted for the rating of electrical machines at the meeting of the International Electrotechnical Commission at Berlin.

The temperature limit recommended at Zurich in January was adopted with a few modifications. This was 90° C. as the highest observable limit for impregnated cotton, with 30° C. as the cooling air temperature. It has now been agreed that, instead of an average cooling air temperature, the maximum probable temperature is to be given;

and in view of differences in opinion whether 35 or 40° C. should be adopted, the matter was referred back to the National Committees. Under the conditions of maximum cooling air temperature, the permissible limits of observable temperatures given below were adopted as approved practice for continuous running. These apply only to windings for rotating machinery, the terminal pressures of which do not exceed 4,000 volts, and to dry transformers with solidly impregnated coils up to 10,000 volts. The question of temperature limits for oil-immersed transformers has been deferred for future consideration. It is assumed that in the windings to which the limits are to apply, the hottest internal spots will not be more than 10° C. in excess of the highest temperatures observable by the methods of measurement recommended by the I.E.C., and of which details will be given later in the official Report. The observable temperature limits permissible in windings for higher pressures than those stated above will be less than indicated in the table, so that the same temperature limits at the hottest internal spot shall not be exceeded.

Non-impregnated cotton ... ..	80° C.

## ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Correspondence on any of the subjects dealt with in this Section is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203-206 Temple Chambers, London, E.C.," and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

### REPORTS OF DISTRICT INSPECTORS OF MINES

FROM the reports of the Government District Inspectors of Mines for the year 1912 we find that the total number of coal-cutting machines in use was 2,444, compared with 2,106 the previous year. Of these 1,134 were electrically driven, compared with 998 in 1911. Of the machines using electricity, 623 were of the disc type, 345 of the bar type, 147 of the chain type, 14 were of the percussive type, and 4 rotary heading. The number of electric safety lamps totalled 10,715, compared with 4,110 in 1911. The figures indicate a very satisfactory progress. The returns of the aggregate horse-power in motors installed are given for the first time. These show that 305,000 h.p. is installed below ground and 194,000 h.p. on the surface. These figures are made up approximately as follows:—Below ground: haulage, 130,000; pumping, 144,000; portable machinery, 31,000; miscellaneous, 11,000; on the surface: winding, 24,000; ventilation, 31,000; haulage, 24,000; coal-washing or screening, 44,000; miscellaneous, 72,000. We give here abstracts of the reports, which could not be included with the others in the last ELECTRICAL ENGINEERING, Mining and Metallurgical section (September 4th, p. 500).

#### Yorkshire and North Midland Division.

Mr. T. H. MOTTAM reports that the number of electrically driven coal-cutting machines has increased by 22 since 1911, while the number of compressed air machines has increased by 68. The total number of machines in use was: compressed air, 311; electric 290. Of the latter 143 were of the disc type, 63 of the bar type, and 84 of the chain type.

There were 4,609 electric safety lamps in use, compared with 922 the previous year. The total number of safety lamps in use was 218,993, compared with 211,356. Of this number 58,924 were magnetically locked, compared with 56,102.

The aggregate horse-power in motors installed on the surface was: winding, 657; ventilation, 3,947½; haulage, 2,088; coal-washing or screening, 6,836; miscellaneous, 18,729; for underground working the figures are: haulage, 24,132; pumping, 11,880; portable machinery, 7,250; miscellaneous, 2,353. Thus the totals are 42,257½ and 45,615 respectively.

One fatal and five non-fatal accidents were reported, as well as one fatal and five non-fatal on the surface. The latter fatality was due to an employee taking a "short cut," which necessitated his climbing over a protecting fence. He came in contact with the contact wires for a coke stamper. The fatal accident below ground was due to a coal-cutter not being earthed. Two of the non-fatal accidents were due to defective cables. An underground fire was due to sparking at the commutator of an unenclosed motor. There were five prosecutions of men for contravention of the electrical special rules.

#### Midland and Southern District.

Mr. H. JOHNSTONE's report shows that the number of electrically driven coal-cutting machines has decreased by four, while the number of compressed air machines has increased by 28. The total number of machines in use was: compressed air, 89; electric, 58. Of the latter 27 were of the disc type, 18 of the bar type, and 13 of the chain type.

There were 81 electric safety lamps in use out of a total of 68,408. The number the previous year was 64,250. Of this number 28,070 were magnetically locked, compared with 25,227 the year previous, while 45,022 were ignited electrically, com-

pared with 43,184. The aggregate horse-power in motors installed on the surface was: ventilation, 715; haulage, 861½; coal washing or screening, 2,276; miscellaneous, 3,309½; for underground working the figures are: haulage, 14,714½; pumping, 14,309½; portable machinery, 1,674; miscellaneous, 464½. Thus the totals are 7,162 and 31,162½ respectively.

Two fatal and three non-fatal accidents due to electricity were reported. Both the former were due to the carelessness of the men killed. In one case an old unearthed trailing cable was temporarily brought into service on a coal-cutting machine in which one of the terminals of the plug box worked loose. In the second case a steel girder was being erected near some 550 volt cables which were not made dead as required by the colliery regulations. One of the non-fatal accidents, which, however, resulted in a horse being electrocuted, was due to faulty earthing connections.

### ELECTRIC SAFETY LAMPS FOR MINES

A NEW order under the Coal Mines Act has been made by the Home Secretary regarding the use of safety lamps in mines, approving certain types of lamp and consolidating previous orders. The following electric safety lamps are approved for general use:—(1) The "Ceag" lamp, made by the "Ceag" Electric Safety Lamp Co. (Dortmund, Germany); (2) the Gray-Sussmann lamps Nos. 3 and 4, made by W. E. Gray (19 Archer Street, Camden Town); (3) the Oldham lamp, made by Oldham & Son (Denton, Manchester), and (4) the Wolf Alkaline and Wolf Lead lamps, of the Wolf Safety Lamp Co. (Bank Street, Sheffield). The following are approved for use by officials or for special purposes only:—(1) The Float patent lamp of the Float Electric Co.; (2) the Oldham Emergency and Oldham Shaft and Roadway lamps, of Oldham & Son. Descriptions of the lamps accompany the order. The Ceag and Gray-Sussmann lamps and the Oldham lamp of the hewer's type were described in ELECTRICAL ENGINEERING, June 5th, p. 317. The Wolf lamps are approved both in the forms containing lead and alkaline cells, and are contained in pressed steel cases with vertical ribs and special arrangements for airtight joints to the upper part containing the lamp bulb. They have a magnetic lock, and weigh under 5 lb. when made to give 1 c.p., all round in a horizontal plane for nine hours, and not less than 1½ c.p. over an arc of 45° in a horizontal plane. The Float lamp for the use of officials is of the bull's-eye pattern, containing a two-cell primary battery. The light is switched on and off by inverting the lamp. The lamp is designed to give 1½ c.p. for nine hours, and weighs 4½ lb. The Oldham emergency lamp was described in ELECTRICAL ENGINEERING, April 3rd, p. 187, and the Oldham shaft and roadway lamps are much larger forms of lamp with some of the same general features as the other Oldham lamps. They give 8 c.p. for nine hours, and weigh respectively 34 and 28 lb.

**Electrical Mining Fatality.**—At the Broomrig No. 2 pit of the Banknoch Coal Company last month, the death of a pit fireman named Waugh was attributed to electric shock while engaged in extending the cable of a coal-cutting machine. His mate had left him, to switch the current on, but on returning found him dead.

**"Wireless" Telephones in Mines.**—Experiments have been in progress at the Dinnington Colliery, near Rotherham, on a system of telephony without special wires, designed by a German engineer named Reinecke, which is said to be in use to a considerable extent on the Continent, and is being taken up by an English company. In the course of the experiments conversation has been carried on through over a mile of solid rock with apparatus of very simple nature such as would be cheaper than an ordinary telephone installation. It appears that connection is made to masses of metal buried in the ground, and in some cases water-pipes, &c., may be made use of for the purpose. In the Dinnington experiments one instrument was placed in the transformer house near the pit bottom, and the other 1,000 yards inbye; a portable set can be used and connected up to suitable metallic substances at any part of the mine. In other experiments conversation was carried on from the moving cage, but in this case an insulated wire was clamped to the winding rope. A demonstration of the system has also been given at a colliery near Kilmarnock. Some particulars of the patents covering these systems were given in ELECTRICAL ENGINEERING, December 5th, 1913, Mining Supplement, page lxxiv.

## COAL DUST EXPLOSIONS

PROFESSOR W. M. THORNTON read a Paper, entitled, 'The Influence of the Presence of Gas upon the Inflammability of Coal Dust in Air,' before the British Association, Section B (Chemistry), at the recent meeting in Birmingham, as briefly noted in *ELECTRICAL ENGINEERING* for September 18th. The Paper describes experiments made to determine the least current which will ignite a mixture of coal dust and a fixed percentage of gas by breaking an electric circuit with different currents flowing. Each reading was obtained by five full ignitions taking place in 100 trials. To copy, as far as possible, the conditions actually existing in a pit the explosion vessel was closed on one side by a flap which prevented air entering during the mixing, but yielded to pressure from within. One result of enclosure is to increase the probability of full ignition. Coal gas and natural pit gas were both used in the tests. The results obtained with coal gas are shown in Fig. 1, whence we see that  $\frac{1}{4}$  per cent. of gas has little effect in forwarding ignition, though with more than this there is a rapid increase in sensitiveness. A similar result is obtained with pit gas. These experiments were, however, made a year later with a different sample of coal dust, but the least igniting current with dust alone was 2.8 amperes at 480 volts, compared with 3.5 amperes with the previous dust. Comparing the results with those for coal gas, it is found that coal gas has slightly more effect in helping the ignition of the dust than pit gas. The ratio of the currents, coal gas to pit gas, is 0.9 at 1 per cent. Above 2 per cent. and below  $\frac{1}{4}$  per cent. there is no difference between the influence of the gases.

FIG. 1.—LEAST IGNITING CURRENTS FOR CLOUDS OF COAL-DUST IN AIR WITH COAL GAS PRESENT.

FIG. 2.—RELATION BETWEEN VOLTAGE AND LEAST IGNITING CURRENT WITH COAL-DUST AND GAS PRESENT.

In dealing with the mechanism of ignition the author points out that the effect of the combustion of dust is to provide in each particle a centre of heat which burns the gas. The igniting gas forms a bridge between the dust particles, and the heat transmitted is sufficient to produce a full explosion by the aid of a quantity of gas which could not in itself be exploded. By plotting the results obtained so as to show the relation between the voltage and the least igniting current, as is done in Fig. 2, it is seen that there is a voltage (about 200 in this case) below which, where very large flashes are not possible, ignition of clouds of dust, even with 2 per cent. of gas present, is exceedingly difficult. The curves also show that the gas is the auxiliary and not the principal of the combined low temperature mixtures. Professor Thornton regards the results of these experiments as confirming the view previously put forward by himself, that the real agent in starting a gas explosion is direct ionisation, or splitting off the electrical charges in a molecule by collision with the charges shot out from the spark. At these low percentages the mixture is too weak for an explosion of gas to be set up by ionisation from the spark, but, since ionisation is probably the essential factor in gaseous ignition, it is possible to regard it as the accelerating agent in the gas-dust explosion. Such a view would explain why coal dust is somewhat more readily ignited in coal gas than in methane mixtures of the same percentage strength. This view also receives support from the results of the Prussian Firedamp Commission of 1886.

**Mining Regulations.**—A series of books containing parts of the abstract and general regulations in respect of the different classes of persons employed in mines is now ready, and can be obtained from the usual Government sale agents. The books are published at the uniform price of  $\frac{1}{4}$ d. each, or 3s. a hundred, and the one concerning the duties of Electricians and Assistant Electricians is known as Mines and Quarries Form No. 58.

## INQUIRY INTO THE CADDER PIT FIRE

## No Evidence that it was Electrically Caused

THE Cadder Pit, in which a disastrous fire occasioning the loss of twenty-two lives, occurred at the beginning of last month, is a naked light pit. The possibility of the fire having been caused by an explosion of gas or coal dust may therefore be ruled out. The first reports of the disaster gave the cause as the fusing of an electric cable, but evidence given in the Home Office inquiry, which was held last week in Glasgow by Sir Henry Cunynghame, and has just been concluded, shows that there was little, if any, justification for this. Some of the witnesses from the colliery went so far as to say that it would have been impossible for the fire to have been electrically caused, and Professor Thornton, who was called in as an expert, said that it was highly improbable that electricity could have caused the fire. He pointed out, however, that the cables were of vulcanised bitumen, which supported combustion better than any other kind of cable he knew of.

The point at which the fire apparently broke out was in or near to a cabin with timber sides used by the workmen as they went to and from their work, and in which they customarily hung their coats. It seemed quite possible that the fire may have been due to a hot pipe left in a man's pocket, to a thrown-down match or cigarette end, or to a piece of lighted or smouldering lamp wick. Smoking was permitted in the mine. Mr. Walker, Chief Inspector of Mines for Scotland, seemed to favour the lamp wick theory. Adjoining this cabin, however, was a switchroom, and both this and the cabin itself were absolutely burned out. The condition of the electrical apparatus in the switchroom itself could therefore not be ascertained, but Mr. R. Nelson, Electrical Inspector of Mines, in his evidence, gave it as his opinion from inspection of other parts of the installation that it was possible that the fire might have been electrically caused, although in the circumstances there could be no proof of it.

The inquiry concluded on Saturday last, but of course it may be some time before the Home Office Report is issued. On the whole, the evidence given at the inquiry seems to offer encouragement rather than discouragement in connection with the proper use of electricity below ground.

**Home Office Prosecution.**—A case was commenced on Friday last against the Agent and Manager of the Dalzell & Broomside Colliery, Motherwell, with regard to alleged contravention of the Coal Mines Act, by failing to take proper precautions in connection with the colliery plant, including some parts of the electrical installation. The electrician of the colliery was originally included in the charge, but his counsel had taken preliminary objection on the plea that the electrician was only liable to examine the plant in accordance with the "duties" cited in No. 14 (c) of the electrical special rules, and that he could not therefore be held personally responsible for the construction, or even the condition, of the plant. The Sheriff upheld the objection. It was decided, therefore, that the electrician could only be proceeded against for failure to examine the plant properly. The hearing of the case against him will be held on Wednesday, October 29th. The case for the prosecution against the Agent and Manager was not concluded on Friday, and was adjourned until yesterday (Wednesday), when the case for the defence was heard; the ultimate result has not yet reached us as we go to press. Mr. Prichard, an inspector of mines in the Scottish district, gave general evidence with regard to the state of the electrical installation. He said, among other things, that the cables were in a very bad condition, and that on one of his visits he discovered fifty-seven bare places, that is to say, places in which the insulation of the cables was entirely lacking.

**Electrical Shot Firing.**—A new Order has been made by the Home Secretary on explosives in coal mines, under the new Coal Mines Act, which contains a few alterations from the former Order. The paragraph on electric shot-firing apparatus is now paragraph (i) instead of (h) and reads as follows:—(i) Every electrical firing apparatus shall be provided with a push button, and with a removable handle which shall not be placed in position until the shot is required to be fired, and which shall be removed as soon as a shot has been fired. The removable handle shall at all times remain in the personal custody of the authorised person whilst on duty. For the push button there may be substituted an arrangement by which the firing contact is automatically made at the end of the travel of the handle, and on the release of the handle is automatically broken.

### AUTOMATIC TELPHER LINE IN A GOLD MINE

THE Randfontein Estates Central Gold Mining Company has installed an interesting automatic telfer line. The gold quartz is first crushed in a tube mill, and then transported, by means of belt conveyors, to a pebble bin, and on to a second mill building provided with 600 stamps. This,

FIG. 1.—AUTOMATIC TELPHER LINE SHOWING TERMINAL.

we are informed, is the largest ore-stamping plant in the world. From here the tailings, which still contain some gold, are taken by belt conveyors to a crushing station. The dead rock is separated and conveyed to hoppers for removal to the dump by means of a surface line. The separated tailings still containing gold come from the crushers into a bunker having 120 tons capacity, and are then conveyed again into the tube mill, where they once more undergo the process of dressing.

FIG. 2.—"ELECTRO-WINCH" TELPHER WITH LOWERED BUCKET BEING TIPPED.

The connection between the quartz bunker behind the crusher station and the ore bunkers is effected by means of a "Bleichert" telfer round the mill building. The telfer buckets are loaded from hoppers underneath the pebble bins, raised, and then travel round the mill building to the pebble bin (see Fig. 1), where they automatically tip their contents. The track is about 1,200 ft. long, and handles about 700 tons

of gold quartz per 55-hour week. The telfer car, on arrival at the pebble bin, comes to a standstill, lowers its bucket which is placed upon a bogie, and conveyed under the hoppers of the pebble bins, where it is loaded. It is then conducted back by the same route in order to be suspended again on the telfer track. The track of the telfer line is horizontal, and is 24 ft. above the ground level, so that it clears any obstacles on the ground. The "Bleichert" telfer is arranged to work so that the cars following each other mechanically throw over switches, which interrupt the current on the section of the conductor wire behind them. The current is only restored when the car has passed the following section of the track, and thrown over the next switch. Thus there is always a section without current between two cars, so that collisions are impossible. The cars stop automatically before the loading point, and then move up and restart on the actuation of a portable controller.

On the property of the Randfontein Company, a so-called electro-winch line has been installed. On arrival at the loading station the car stops automatically, and the workman on duty gives it current through a controller, which he closes with a plug, thus causing the car to lower its bucket. The latter can then either be placed on a bogie, as at Randfontein, or loaded direct by shovelling or from hoppers. The current is switched on, and the skip is raised. All further movements are automatic, as the winch is self-contained, as may be seen from Fig. 2, which shows a car on the track after having been tipped. As soon as the end station is reached, the car tips and returns automatically. The next car, in the meantime, proceeds to the loading station. The serviceable nature of the equipment can be appreciated from this illustration, and, obviously, it is a great labour-saving device. We understand that in one installation at the blast furnaces of Gebrüder Stumm, Neukirchen on the Saar, the services of 125 men were dispensed with. During the last eight years over 400 "Bleichert" telfers have been constructed. The installation of these plants in England and the Colonies is in the hands of Bleichert's Aerial Transporters, Ltd., Egypt House, 86 New Broad Street, London, E.C.

### SIGNALLING IN MINES

AN electrical signalling indicator for use with mechanically-operated bells for mine shafts and haulage has been put on the market by Siemens Bros. & Co., Ltd. (Woolwich), as a result of the recent revisions to the mining regulations requiring a visual indicator to be installed when the uniform code of bell signals comes into force (see ELECTRICAL ENGINEERING for July 3rd, p. 395). The apparatus consists of a dial indicator with a pointer, which is moved one step for each bell stroke, a contact-maker actuated by the bell rope,

FIG. 1.—ROPE-OPERATED SWITCH.

FIG. 2.—DIAL INDICATOR.

and a switch with gearing attached to the winding gear for returning the pointer to zero. The switch, shown in Fig. 1, is fitted near the bell rope or chain, so that a stop on it operates the switch when it is pulled. This causes the pointer on the indicator, Fig. 2, to move to the order given. The pointer is reset to zero by a switch which is worked automatically as soon as the engine driver moves the engine to carry out the order. Similar apparatus is supplied for use with electric bells, whilst apparatus to give a luminous signal is also made by the Company.

### Energy and Electrode Consumption in a Steel Melting Furnace.

—Observations made upon a Rennerfelt steel melting arc furnace at the Hallstahmoner Iron Works in Sweden have shown that the electrode consumption was 2.5 kg. per ton of finished steel, and the energy required was about 590 kw. As the result of the trials has been considered satisfactory, furnaces for 200 kg. and 1,000 kg. capacity are being built.

# "SYNCHRON" THE LIFE-SAVER

The latest invention for restoring animation after apparent death from Electric Shock, Drowning, Mine Gas Poisoning, etc.

A boy can use it, no technical knowledge necessary.

*The Star, Nov. 28th, says:—*

"Electric shocks need not necessarily prove fatal, and people who have been victims of a shock appear to be like people who have been immersed in a pond; both may be revived by means of artificial respiration.

"Some very interesting information regarding this is given in the 'Lancet' by Dr. Reginald Morton, President of the Section of Electro-Therapeutics in the Royal Society of Medicine, who states that practically no shock, however severe, need necessarily prove fatal.

"Death from electrical shock is only an apparent death at first, and whatever the conditions or severity of the accident, there is practically always a time, varying from a few minutes upwards, during which it is possible to resuscitate the victim by artificial respiration if resorted to at once.

"So important is it to commence artificial respiration quickly, that it is the first duty of the bystander to see to this before everything else."

## YOU CAN DO THIS WITH THE SYNCHRON

it is always ready.

### STEEL REFINING IN AN INDUCTION FURNACE

THERE was an interesting discussion on the Paper read at the meeting of the Iron and Steel Institute in Brussels by Mr. Otto Frick, in which the induction furnace designed by the author was described. This has a rotating cover, small bath inclination, low energy consumption, and a lining giving a regular life of between two and three months. Two of these furnaces are in use in Germany for melting cold scrap. The Paper itself was dealt with at some length in *ELECTRICAL ENGINEERING*, September 4th, page 498.

The discussion was opened by Mr. Campbell, who pointed out that the conditions in Belgium were not quite the same as elsewhere. Although there, probably, electric steel could be made as cheaply as any, in America there was no basic Bessemer, and the cost of melting and refining was higher, but a duplex process might turn out to be the cheapest. In England the quality of open-hearth steel was already so good that it would be difficult to show an improvement on present practice. There was a disadvantage in using alternators of specially low frequency for furnaces, as they could not assist in general power supply if required. He was not in favour of very large-sized furnaces, and thought that 15 tons was a convenient limit. Mr. Ledingham, the next speaker, emphasised the point that raw material with a good analysis was usually necessary to make a good steel, but if the electric furnace could make good steel out of common scrap, it was doubly interesting. Mr. Greville Jones asked for some costs of converting cold scrap. Mr. Frick in his reply to Mr. Campbell expressed the opinion that a 15-ton furnace was already large, but did not anticipate any difficulty in making them up to 25 tons. The efficiency went up considerably with the input. He did not think that the electric furnace would very largely replace the crucible, but its importance lay more in the treatment of such material as structural steel. The great advantage of the electric furnace was the absence of oxide in the slag. In reply to Mr. Jones, the best way was to melt the cold scrap first in an open-hearth furnace, and then transfer it to the electric furnace. Mr. E. Houbauer, of the Cockerill Co., sent a communication doubting that the author's reasoning would apply to very large refining furnaces, and generally preferred the arc type of furnace.

### ELECTRIC MINING AND METALLURGICAL PATENTS OF SEPTEMBER

THE following patent specifications, of particular interest to mining electrical engineers, have been published by the Patent Office during September. In No. 28816, of 1912, by H. Joris, of Liège, Belgium, a construction of miner's electric safety lamp, in which the lamp is switched into or out of circuit by a rotary motion of the top part, is described. To protect the switch chamber from the external atmosphere as well as from the accumulator gases, the contacts are arranged in a sealed chamber in the removable cover of the accumulator casing. The chamber is closed at the top by a baseplate screwed on to a raised part of the cover, and carrying the head of the lamp which effects the switching by a rotation, limited by a screw in the casing engaging a groove on the base-plate. The terminal contacts are made by balls arranged in metal sockets under the action of springs. A set of similar springs and balls serves to balance the pressure of the terminals. In No. 13,694, of 1913, W. W. Gordon and J. Wright, of Hetton-le-Hole, Durham, claim a method of unlocking and igniting safety lamps by a single-phase transformer giving 25 and 6 volts. The 25-volt supply is applied to an electromagnet through a switch to unlock the lamps, and the 6-volt supply is used on an induction coil to effect ignition. In No. 2,546, of 1913, J. Close, of Glengarnock, Ayrshire, describes a signalling system consisting of electrical visual indicators at the pit bottom and engine-room respectively, and operated by a local battery put into operation by pull wires or ropes from the workings, so that no live conductors need be taken down the shaft. Connections are made through the gates to the engine-room to indicate when they are closed.

Of special interest to electro-metallurgists is Specification No. 1,933, of 1913, by Deutsche Gold and Silber-Scheide-Anstalt, of Frankfurt-on-Maine, who, through G. W. Johnson, claim a modification in the Castner process for the production of alkali metals by the molten electrolysis of caustic alkali at a temperature a little above the melting point, which consists in coating the collecting vessels on the outer walls up to the level of the electrolyte with a substance which withstands the action of chlorine. One method of effecting this is by the use of asbestos rope soaked with a thin pulpy mixture of water glass and asbestos meal. This rope is wrapped round the vessel, which is then ready for use with cheap materials, as the anode products cease to have a detrimental effect.

**Iron Ore Smelting in Sweden.**—According to the *Board of Trade Journal*, Mr. Assar Grönvall, an engineer and director of the firm of "Aktiebolaget Elektrometall," has petitioned the Swedish Government for the right to crush iron ore on the State-owned fields in Norrbotten, for electric smelting. It is proposed to erect two furnaces in Kiruna of 4,000 h.p. capacity each, at a total cost of 1,000,000 kr. (about £55,500). The Government asked the Committee of the Swedish Iron and Steel Institute to report on the matter, and it has advised the Government not to approve the petition, chiefly on the ground that the manufacture of charcoal pig iron for export is not desirable either for the works turning out pig iron or for the local steel works. The Committee considers it would have been more satisfactory had the petition originated from some association representing Swedish iron works which intended by using this ore to produce a comparatively cheap pig iron for the refining works in Sweden. The whole question has now been submitted to the Swedish Board of Trade for report.

**Electricity in Mines in Pennsylvania.**—The U.S. Geological Survey *Press Bulletin* shows that in this important coal mining district in 1912 no less than 81 million tons, or 50.8 per cent. of the total, was mined by machines. In 1911 the quantity of coal so mined was 68 million tons, or 47.78 per cent. of the total. The number of machines in use in 1912 was 6,176, and most of these were electrically driven. The *Electrical Review and Western Electrician* (Chicago) points out that in 1882 the coal mined in Great Britain was 70 per cent. in excess of that mined in the U.S., but at the present time the position is reversed. The U.S. contributes 40 per cent. to the world's supply of coal, but consumes 99 per cent. of this itself.

**Electric Blasting in South African Mines.**—In connection with the inquiries being made into the condition of labour in the South African mines, experiments are being made into the possibility of firing the whole of the blasting charges simultaneously, while all the men are withdrawn from the mine. The whole of the eighteenth level of the Meyer and Charlton mine, comprising some 800 shots, was fired together recently from one station, and the cables are now being placed to enable all the blasting to be effected from the surface.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published September 25th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**

12,642/12. **Metallising Ceramic Surfaces.** Q. MARINO. The surface is given a coating of copper, tin, cadmium, or cobalt fluoride, which is then reduced by brushing on a metallic powder.

12,687/12. **Single-phase Commutator Motor.** L. ROTZER. The armature winding is connected to a commutator with short-circuited brushes, and also to two slip rings, so that certain points in the armature may be short-circuited. With this path open, the motor is started up as a repulsion motor, and as synchronous speed is reached, the short-circuit is automatically brought into operation. The motor now runs synchronously with any load. Four figures.

12,908/12 and 19,029/13. **Circuit Protection.** F. A. BECKER. Circuits are protected from foreign waves by an inductance, with capacity and damping resistance in parallel, in series with the line. Compensation shunts may be provided. One figure. Excess pressures in an A.C. circuit brought about by switching are prevented by adjustable shunt circuits containing capacity or inductance. These circuits and the load constitute a tuned resonance path through the switch, which is locked unless the current and pressure are practically in phase. Two figures.

20,185/12. **Agricultural Machines.** W. WORTMANN. Current is conducted to the travelling machine through the insulated lead of an armoured cable, which is wound up by, and unwound from, the machine. A bare earthed wire is used for the return in conjunction with the armouring.

20,225/12. **Vehicle Lighting.** A. E. BERDON. A variable speed dynamo is regulated by a differential magnetic shunt, while a storage battery in parallel with the load is controlled by a switch equipped with a pressure and a current coil. A coil is also mounted on the shunt, in series with the pressure coil, and connected in the battery circuit. Three figures.

20,662/12 and 20,744/12. **Motor Control.** B.T.-H. Co. (*G.E. Co., U.S.A.*). The first specification relates to a series parallel control system in which the necessary changes in connection are effected by contactors energised through a master-controller and locked by a combined time and current limiting relay. Three figures. The second specification relates to the control of motor-generator sets, in which the motor is of the variable speed type. To compensate for the pressure drop in the generator as the speed falls, resistance in the generator field circuit is automatically short-circuited by a switch worked by current taken from the motor slip rings. One figure.

23,776/12 and 24,059/12. **Resinous Insulators.** B.T.-H. Co. (*G.E. Co., U.S.A.*). An insulator which can be moulded is produced by bringing an infusible reaction product of phthalic anhydride and a polyhydric alcohol into contact with a liquid solvent. In another process camphoric acid is heated with a polyhydric alcohol, *e.g.*, glycerol.

25,207/12. **Alternators.** ATELIERS DE CONSTRUCTIONS ELECTRIQUES DU NORD ET DE L'EST. Momentary short-circuit currents are reduced by an inductance in the field circuit, obtained by linking part of the field windings with a subsidiary magnetic circuit. One figure.

26,256/12. **Heating of Rooms.** T. J. DIGBY. An element in a quartz tube protected by a reflector is fixed along the lower edge of the door so that the incoming air is heated. When the door is open, a sliding contact opens the heater circuit. Six figures.

26,344/12. **Railway Systems.** W. B. PERVIS and A. D. GRITMAN. To do away with the necessity for a constantly energised third rail, this is sectionalised, and each section is connected to terminals in a separate closed conduit, where also is a sectionalised conductor connected to the main feeder. Magnets in connection with the rail vehicle attract the conductor sections to the third rail terminals, so that only one or two sections of this are simultaneously alive. Five figures.

26,347/12. **Heaters.** M. ALBRECHT. Resistance strips separated by strips of mica are tightly rolled and inserted into a tube, which is compressed so that the walls press tightly on the mica. Several constructions are described. Eight figures.

27,455/12. **Metallised Carbon Filaments.** B.T.-H. Co. (*G.E. Co., U.S.A.*). Raw carbon filaments are impregnated with a boron solution (1 per cent. solution of sodium borate), then carbonised, and finally metallised.

3,246/13. **Wireless Telephony and Telegraphy.** SIGNAL GES. At least two pairs of earthed plates are used at both ends. The signalling current is passed between the pairs of plates at the transmitting station. If the plates are disposed horizontally, one plate pair is angularly displaced from the others. The currents for each plate pair differ slightly in phase. On board ship the plates may be disposed vertically—one is comprised by the hull of the vessel. Four figures.

5,082/13. **Submarine Signalling.** E. C. R. MARKS (*Submarine Wireless Co., U.S.A.*). A mechanically operated reed is controlled by a key through an electromagnetic clutch. Five figures.

12,935/13. **Switching Arrangement on Heaters.** R. WEAVING and FERRANTI Co. Two heats are obtained by the use of two single-throw switches. Two elements may be connected in series across the mains through one switch, while the other is used to short-circuit one element. The elements may also be connected so that they are both in parallel or one short-circuited. Two figures.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, &c.:** BOOTH [Series system of incandescent lamp lighting] 1,002/13.

**Dynamos, Motors, and Transformers:** HARTMANN [Metal vapour rectifiers] 15,937/12; CROMPTON & Co. and BURGE [Polyphase motors and generators] 3,227/13.

**Electrometallurgy and Electrochemistry:** GUTERMAN [Electrolysis] 8,352/13; A.-G. FÜR ANILIN FABRIKATION [Electrolytic production of hydrosulphites] 13,901/13.

**Heating and Cooking:** NATHAN [Heaters] 24,131/12; RAVES [Liquid heaters] 14,562/13.

**Ignition:** BRISTOL WAGON & CARRIAGE Co. and COPSEY [Magnet trip-gear] 25,374/12.

**Incandescent Lamps:** POULTON [Storage and transit] 22,209/12; WOLFRAM LAMPEN A.-G. [Filament supports] 12,753/13.

**Switchgear, Fuses, and Fittings:** GREEN [Junction boxes] 20,831/12; COTTIER and DOWNES [Conduit fittings] 21,971/12; DAWSON [Controller contact] 23,402/12; STATTER [Time elements for circuit breakers] 25,606/12; SCHUCHARDT [Balance weight suspension for lighting] 8,467/13.

**Telephony and Telegraphy:** BLOCK [Disinfecting telephones] 2,215/13; SHREEVE [Telephone repeater system] 4,611/13; SIEMENS & HALSKE [Construction of the bank-contact sets of selectors] 15,164/13.

**Traction:** ALLARD [Block-signalling and train control] 6,185/13.

**Miscellaneous:** FARBER [Safety battery lamps] 20,352/12; OLDHAM [Miners' safety lamps] 24,438/12; SUTER [Reflectors for incandescent lamps] 25,536/12; SMITH (*Smith*) [Engine-room telegraph alarm] 29,311/12; ELIA [Submarine mines] 16,379/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Electrometallurgy and Electrochemistry:** CONSORTIUM FÜR ELEKTROCHEMISCHE INDUSTRIE [Manufacture of per acids from aldehydes] 16,849/13; [Manufacture of aldol] 19,463/13; MÖLLER [Separation of suspended bodies from non-conducting fluids] 19,732/13.

**Storage Batteries:** RABBIDGE [Electrolyte] 19,782/13

## Amendment to Specification

14,478/11. **Vehicle Lighting.** S. W. RUSHMORE. Owing to the extended investigation under Section 8 of the Act, this specification has been amended by way of disclaimer. A vehicle lighting system, in which a variable speed dynamo and iron wire ballast resistance are used is described.

## Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** SIEMENS DYNAMO WORKS (*Siemens-Schuckert*) [Negative electrode for search-lights] 12,556/08

**Distributing Systems, &c.:** A. E. G. [Motor-generator sets and fluctuating load systems] 9,977/08; B. T.-H. Co. (*G. E. Co., U.S.A.*) [Centrifugal compressor driving] 12,515/08.

**Dynamos, Motors and Transformers:** E. ARNOLD and F. COLLISCHÖNN [Cross-connecting wave-wound armatures] 11,857/01.

**Electrometallurgy:** F. T. SNYDER [Zinc ore furnace] 13,254/07.

**Incandescent Lamps:** G. MICHAUD and E. DELASSON [Oxide filaments are heated by a conducting core] 4,461/08.

**Switchgear, Fuses and Fittings:** E. WESTON [Pneumatically operated carbon plate resistance, for large currents] 13,027/05; W. F. JONES [Resistance unit] 15,582/07.

**Telephony:** W. AITKEN [C. B. systems and relay] 13,216/04.

**Traction:** SIEMENS BROS. & Co. (*Siemens & Halske*) [Motor-operated points and signal locking gear] 10,579/00.

**Miscellaneous:** H. CORLIAND [Automatic central station fire alarm system] 11,667/01; W. H. HOYLE and T. BARKER [Lift control] 13,204/04; H. B. BARLOW (*International Postal Supply Co., U.S.A.*) [Postmarking and printing] 13,466/07.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,358.

It is required to drive an existing planing machine with a 20ft. travel and vertical and horizontal feeds of 10in. with provision for three tools by individual motor drive. The machine is at present driven by belting on to a 24in. pulley running at 300 r.p.m., and there are stepped pulleys on the counter-shaft so that a 50 per cent. variation in the speed of the cutting stroke can be obtained in several stages. The usual automatic belt-shifting arrangement is provided to obtain a quick return, but the pulleys for this purpose could easily be removed if it is decided to obtain all the variation of speed by control of the motor. Give a specification which would enable an electrical firm to quote alternatively for a constant or variable-speed 500-volt continuous-current motor with complete control equipment.

(Replies must be received not later than first post, Oct. 9th.)

### ANSWERS TO No. 1,356.

Work out, in terms of the rated wattage and voltage of a tungsten lamp when run at normal efficiency, the range of resistance necessary for a dimming switch in series with the lamp to reduce the candle-power to from 5 to 60 per cent. of the normal. Over what range of candle-power will the various dimming switches on the market regulate a 55-watt 200-volt lamp?—"H. T."

An award of 10s. had been made to L. BOOTHMAN for the following reply:—

Curve "C" shows the variation in candle power of a tungsten lamp, with reduction in voltage, in percentage of

the normal. "D" shows the resistance required in series with lamp to reduce candle power and voltage on lamp. This resistance is measured in percentage of the lamp resistance at normal voltage, i.e.,  $(\text{normal volts})^2 \div \text{rated watts}$ . Curve "R" shows the variation in resistance of the lamp with voltage. "W" shows the watts absorbed in resistance as the candle power is reduced. These watts are measured in terms of the rated lamp watts.

Example:—A 55-watt 200-volt lamp has a resistance at rated voltage of  $(200)^2 \div 55 = 727$  ohms. To reduce the candle power by 60 per cent., from curve C, volts on lamp must be 78 per cent. of 200=156 volts, and lamp resistance at this voltage is about 90 per cent. of 727 ohms=655. Then resistance of lamp plus dimmer  $= (655 \times 200) \div 156 = 840$  ohms, i.e., dimmer resistance  $= 185$  ohms  $= 25.5$  per cent. of 727 ohms. Watts on dimmer  $= (200 - 156)^2 \div 185 = 10.5$  or 19.1 per cent. of 55. Curves D and W have been drawn for a number of these points. Curve D with another 100 per cent. increase of resistance reaches to 20 per cent. of voltage.

The "Twilight" dimming switch effects a saving of 65 per cent. in watts, of normal, at full dim, the lamp voltage being about 20 per cent. of normal. The candle power is extremely low—about 5 per cent. only. Any successful single lamp dimmer must give a glimmer only at full dim. (The curves given are compiled from an article in the *Electric Journal*.)

No second award has been made.

## COOKING AND HEATING APPARATUS

IN addition to many designs of the older types of luminous electric radiator in which the radiation and convection principles are combined on the Dowsing system, a large proportion of the current catalogue on electric heating and cooking apparatus, supplied by the Dowsing Radiant Heat Co., Ltd. (105 Great Portland Street, W.), is devoted to hot-bar radiators. These, like the luminous radiators, convector and radio-convectors, are obtainable in numerous attractive designs suitable for industrial or residential apartments. The hot-bar elements are made with or without quartz coverings as desired. Each takes 500 watts, and they are

FIG. 1.—HOT-BAR GRID SHOWING RESISTANCE SPIRAL IN POSITION. THE QUARTZ PROTECTING PLATE IS REMOVED AND SHOWN BELOW.

all run in parallel on each apparatus. They are strongly constructed and rarely break. As may be seen from Fig. 1, a very large heating surface is exposed, so that full dispersion of the heat is produced, and by means of the reflector a ruby illumination is obtained. Red-glow radiators on the Bastian system are also listed. All the elements can be easily inspected and renewed when necessary, and a reflector is used which forms a hot-air chamber through which the heated air passes, so that a strong current of air is kept in circulation. Attention has also been given to the many mechanical and electrical constructional details.

In addition to the heating apparatus listed may be mentioned the latest design of cooking range, irons, hot-plates, water urns, sterilisers, &c. In particular there is a number of improved electric kettles fitted with special elements, while the toaster grill and hot-plate combined, shown in Fig. 2, is a very useful piece of apparatus. It is made of sheet metal with nickel facings, and is fitted with

FIG. 2.—COMBINED GRILL AND HOT-PLATE, IN WHICH PROTECTED HOT-BAR ELEMENTS ARE USED.

the new quartz-protected hot bars previously mentioned, so that there is no danger of short-circuits due to the meat or the fork touching the elements. These grillers are in

daily use at the Company's medical institution in London, where cooking for sixty persons is carried out. Still another speciality is a breakfast toaster and dish warmer. Plates and dishes may be kept warm on the hot-plate, while the under-portion is fitted with two toast racks, so that it may be regarded as a most useful breakfast-table adjunct.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The definite announcement has been made that the Marconi Co. has acquired the Goldschmidt patents held by Compagnie Universelle de Telegraphie et Telephonie sans Fil of France, and with a view of developing these it is proposed to increase the capital of the Marconi Co. by 500,000 ordinary shares. It is proposed to offer immediately 250,000 of these shares to the preference and ordinary shareholders at £3 5s. per share, or a premium of £2 5s. per share. The whole of the new issue has been guaranteed at this price. It has been stated that the price to be paid for the Goldschmidt patents is 200,000 shares, which at the present price represents a sum of £800,000 less £200,000 cash, which is to be provided by the French Co.

The wireless station erected by the Anglo-French Wireless Co., Ltd., at Nassau, in the Bahamas Islands, has been completed and accepted by the Government. The power of the station is 5 kw., and it has a normal day range of 400 miles; satisfactory communication has been established between Key West, Jupiter and St. Augustine. A similar station will shortly be erected at Georgetown, Barbadoes.

In order to secure as far as possible privacy of wireless messages, all licencees of portable wireless sets must now carry with them a small pocket card, which is issued by the Post Office with the licence. This card must be shown on demand to any Government officer, including the police.

At the fortnightly meeting of the Liverpool and District Amateur Wireless Association, on September 25th, the subject of "Loose-coupled Receiving Sets" was discussed by Messrs. Coulton & Frith. The next meeting will be on Thursday, October 9th.

The Tangier-Arzila line has been restored by the Spanish Government, and the Chorillos-Mollendo cable is also in working order again.—The Indo-European Telegraph Co. suffered a breakdown of their lines between Kertch and Soukhoun-Kale on the 25th inst., which was speedily put right.—Telegrams may be again sent to Chihuahua in Mexico, as communication has been restored.

**L.C.C. and Repayment Periods.**—The L.C.C. has recently revised the periods for repayments of electrical loans, which now stand as follows:—Land, 60 years; buildings, 30 years; mains, 25 years; machinery, 15 years; services, 12 years; meters, 10 years. In reporting upon this Mr. J. Horace Bowden, Chief Electrical Engineer and Manager of the Poplar electricity works, points out that he has hitherto advocated a policy of borrowing only for periods of 20 years and over. In his opinion the action of the L.C.C. is most drastic, and places severe restrictions upon expansion of business.

**"The Lighting Journal and Engineer."**—A new monthly journal bearing this title has made its appearance, and its first issue, published on Tuesday, contains several interesting articles. In addition to those of a general nature, there is a short article on the artificial lighting of lawn-tennis courts—on which subject however, more information of a quantitative nature would be useful—and a serial on "Period" Designs of Lighting Fixtures is commenced. Messrs. A. W. Robinson and A. J. Greenly are responsible for the editorial and business management respectively, and Messrs. Haydn T. Harrison and C. W. Hastings are "Honorary Advisory Editors."

### ELECTRIC TRACTION NOTES

In his presidential address to the Annual Conference of the Municipal Tramways Association, held last week at Sheffield, Mr. A. R. Fearnley (General Manager, Sheffield Corporation Tramways) said that no better proof could be given that municipal tramways were not marking time in any way than the fact that nineteen applications for provisional orders were deposited in Parliament at the beginning of the year. The present tendencies in tramway operation were in the direction of improved running time and the small equipments with which cars were provided twelve or fourteen years ago were being replaced with equipments double the size, often with interpole motors. Much better work was being put into tramway tracks than formerly, and the mechanical joint was being fast superseded by electric, thermit, or cast welding. The idea of keeping the tramway power-house separate from the other supply stations was being abandoned. In Sheffield arrangements were being made for any of the three power-houses to be available at times of heavy load or emergency. Board of Trade returns showed an increase of 220 million passengers over the previous year. Mr. Fearnley touched on the Report of the Motor Traffic Committee, which appeared to him to assist in many ways the demand for equality of treatment for which they were asking. With regard to trolley and motor omnibuses he thought that good types of vehicles were to be obtained, but their accommodation was very limited, and there were very few roads really suitable for them. The subject of platform fare collection was dealt with by Ald. S. Flint, of Leicester, who described in detail the pay-as-you-enter system which is being experimented with in that town. Cr. W. C. Fenton's Paper on "Maintenance of Paving on Tramway Routes" contained a plea for the revision of the section of the Tramway Act of 1870, which requires the tramway promoters to maintain the road surface. The last Paper, entitled "Urban Passenger Transport," was by Mr. J. B. Hamilton (General Manager, Leeds Corporation Tramways), and contained a comparative investigation into the relative economy of electric tramways and motor omnibuses under the conditions obtaining in provincial towns. He first showed how electric tramways had alleviated overcrowding, had created and supplied a demand for travel, and proceeded to demolish some of the arguments advanced by those interested in motor omnibuses. After going into the matter in some detail, he put forward 9'167d. per car mile, with fifty-six seats, as a fair inclusive figure for tramway cost, and 10'06d. for a thirty-four-seated bus. Taking the earning power of a bus as 80 per cent. of that of a tramcar, he reckoned that on a basis of 36,740 miles per annum there would, in the case of the tramways, be a surplus of £291 per car after payment of rates and paying maintenance charge, while the bus service would result in a deficit of £176 per vehicle. These figures relate to the comparison of complete provincial services, but it is admitted that in London there are special conditions more favourable to motor omnibuses. With regard to the use of motor-buses as feeders for tramways, Mr. Hamilton prefers railless traction as costing 20 to 25 per cent. less to run, and being more reliable. Ald. Tinsley, of Salford, has been elected President for next year, and Mr. P. Fisher, Tramways Manager, Dundee, Vice-President.

Ever since Parliament sanctioned the Brighton and Hove trolley omnibus schemes, two years ago, a strong difference of opinion has existed between the two Corporations as to the best means of carrying out the through-running arrangements imposed by Parliament. As a matter of fact, the Hove Corporation has never been very favourably disposed towards trolley buses, and, according to the local papers, negotiations are in progress by which the Brighton Corporation will agree to Hove abandoning its trolley bus scheme if the supply of electricity in Hove—now that the Hove Corporation has acquired the local electric supply company—is given from Brighton.

## LOCAL NOTES

**Bristol: Wages in Electrical Trade.**—The Bristol electrical contractors have held a meeting to consider the demands of the Bristol branch of the Electrical Trades Union for an increase of 1d. per hour for electrical workmen, making 9d. per hour for men, and 10d. an hour for foremen. A deputation was appointed to meet the Electrical Trades Union, and it is stated that there is every prospect of an amicable result, although, as a matter of fact, the men ceased work on Saturday in accordance with their notices.

**Bury: Bulk Supply.**—In connection with the arrangement entered into with the Heywood Corporation for a supply in bulk to that authority, it has been necessary to seek the consent of the Lancashire Electric Power Co., which has statutory powers to supply local authorities within its area in bulk. The Power Co. has refused its consent to the proposed arrangement between Bury and Heywood, and, acting upon the instructions of his Corporation, the Bury Town Clerk has made an application to the Board of Trade for an order dispensing with the Power Co.'s consent.

**Gromer: Transfer of Electricity Undertaking.**—The Board of Trade has decided to sanction the transfer of the Council's electric lighting undertaking to Edmundsons' Electricity Corporation. As we have reported from time to time in these columns, the present state of affairs is that Edmundsons' are managing the undertaking on behalf of the Council, but it is intended to transfer the undertaking completely to Edmundsons'. To this proposal, when it was first made, there was considerable local opposition, but a local inquiry was held on behalf of the Board of Trade by the Hon. T. H. Pelham, with the result stated above. All the expenses incidental to the inquiry will be borne by Edmundsons', who will also take over the outstanding debt upon the undertaking, which amounts to some £18,000.

**Hove: Electric Lighting.**—As announced in our "Electric Traction Notes," there is a rumour that the Corporation is bargaining to transfer the Hove Electric Lighting Co.'s undertaking, recently acquired, to the Brighton Corporation.

**Ilford: Rateable Value System of Charging.**—The rateable value system of charging is to be introduced as from the December meter readings. The primary charge is to be 12½ per cent. of the rateable value, plus ¾d. per unit for all units consumed.

**Leeds: Electricity Reserve Fund.**—During the course of the L.G.B. inquiry last week into an application by the Corporation for sanction to borrow £168,000 in connection with the electricity undertaking, Mr. H. R. Hooper, the inspector, expressed himself very strongly upon the inadequacy of the reserve fund of the electricity undertaking. This, he said, was a paltry £3,000, which was not worth considering, and, further, there was apparently no intention of increasing it. He also called attention to the fact that in 1907 the reserve fund was £14,000, whilst the profits were £3,400; yet in 1913, when the profits were £15,500, the reserve fund has been reduced to the small figure of £3,000. The Town Clerk pointed out that the reason for the decrease in the amount of the reserve fund was that the whole of the £14,000 in 1907 was transferred in aid of the City rates consequent upon a decision by the Corporation. Mr. Hooper replied that he was looking at the matter from a commercial point of view, because he could foresee a time not very far distant when there would be a considerable debt outstanding upon plant which would be obsolete, and for which no provision was being made in the finances of the undertaking. It was, he said, a position which would have to be met sooner or later. The Town Clerk replied that the Inspector's comment was upon the policy which the Corporation had decided to follow. Hitherto the Corporation had dealt with the reserve fund as part of the general basis of rating, and when the necessity arose the Corporation would have to provide money to meet the position foreshadowed by the Inspector.

**Manchester: New Power Station.**—The Electricity Committee has under consideration the acquisition of eleven acres of land at Trafford Park with a view to erecting a 100,000-kw. power station. The preliminary estimates provide for a first instalment of 25,000 kw. Considerable economies are anticipated from a power station on this site, inasmuch as coal can be delivered much more cheaply than at present, whilst arrangements could also be made for the use of the water from the Manchester Ship Canal for condensing purposes.

**Stoke-on-Trent: Consolidation of Electricity Works.**—There has been some talk of an amalgamation of the various elec-

tricity works now owned by the Corporation, and which were in existence before the Federation scheme was passed by Parliament. Under the Corporation's Act the policy of maintaining the various power stations as separate generating stations may be discontinued, with the consent of the Local Government Board, and one of the advantages of the high-tension scheme, described in *ELECTRICAL ENGINEERING*, Vol. VII., July 27th, 1911, p. 425, would lie in the direction of shutting down, at any rate, the smaller works as generating centres. Some action of this sort was the inevitable result of the scheme by which the four boroughs of Burslem, Hanley, Stoke and Longton were converted into one borough.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Aboyne.**—An Aberdeen firm of electrical engineers has placed an electric lighting scheme before the Council.

**Bacup.**—Application has been made for sanction to borrow £2,800 for H.T. feeder and services.

**Bridlington.**—The L.G.B. has sanctioned the borrowing of £1,500 for mains, repayable in twenty years, and £1,500 for services repayable in fifteen years.

**Burnley.**—Application is to be made for sanction to borrow £36,227 for electrical extensions.

**Carlisle.**—A L.G.B. inquiry has been held concerning an application to borrow £8,034 for plant extensions and £1,300 in connection with H.T. supply to outside districts. There was no opposition.

**Chobham.**—A supply by either the Ascot or Woking Companies is possible in this district.

**Haslingden.**—Tenders are invited for cable.

**Leeds.**—A L.G.B. inquiry was held last week concerning a loan of £168,000 in connection with the electricity undertaking. Of this £28,000 is required for machinery, £100,000 for mains, and £30,000 for sub-station transformers. We refer to some comments by the inspector as to the reserve fund under Local Notes.

**Manchester.**—One 1,800–2,200-kw. motor-converter or rotary-converter and static transformers; high-tension switchboard; static transformers. Chief Electrical Engineer, Dickinson Street. October 16th. (See an advertisement on another page.)

**South Africa.**—The Worcester Council, says the *African World*, has decided to erect an electric power station. Consulting Engineer, Mr. T. Stewart, P.O.B. 712, Cape Town.

**Southampton.**—A L.G.B. inquiry was held last week concerning a loan of £16,720 for electrical extensions. During the course of the inquiry Mr. T. C. Ekin, the inspector, criticised the action of the Corporation in 1912 in transferring £3,000 to relief of rates from the electricity undertaking.

**South Shields.**—One 2,000-kw. turbine direct-coupled to two three-phase generators in tandem; condensing plant, rotary-converter, transformers, switchgear, &c. Borough Electrical Engineer. October 15th.

**Stalybridge.**—Sanction has been received to the borrowing of £9,200 for electrical extensions.

**Swansea.**—Sanction to the borrowing of £40,000 for electrical extensions has been received from the L.G.B.

**Warrington.**—L.T. cable and L.T. feeder panel. Borough Electrical Engineer, October 14th.

## Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

**Arbroath.**—Public baths.

**Birmingham.**—New Post Office.

**Bolton.**—New P.O. H.M. Office of Works, London.

**Mansfield.**—Extensions at free library.  
**Newport (Mon.).**—New town hall and courts, £164,000.  
**Oldham.**—New school.  
**Peterborough.**—New theatre.  
**Preston.**—New Wesleyan school, £4,000. Architect, F. Howarth.  
**Stockport.**—New trades hall. Architects, W. Swann & Stockton.  
**Trowbridge.**—Cinematograph theatre.

### Miscellaneous

**Birkenhead.**—A twelve months' supply of metallic and carbon filament lamps and fittings for Mersey Railway Co. General Manager, October 9th.  
**Edinburgh.**—The Midlothian & Peebles District Asylum requires a twelve months' supply of electrical fittings. Treasurer, 19 Heriot Row.  
 A telephone installation is required at the Craiglockhart poorhouse. Architect, R. M. Cameron, 53 Great King Street.  
**Johannesburg.**—Electric lighting fittings for the Town Hall and municipal buildings. Town Clerk. November 24th. Particulars from E. W. Carling & Co., St. Dunstan's Buildings, St. Dunstan's Hill, E.C.  
**London:** Great Western Railway.—One year's supply of electric sundries. Secretary, Paddington Station. October 13th.  
**Manchester.**—Special contract work for Tramways Department. General Manager. October 21st.

### TENDERS RECEIVED AND ACCEPTED

**Derby.**—The tender of the British Thomson-Houston Co. for switchgear has been accepted at £943.  
**Dublin.**—The following tenders have been received for the supply of single and three-phase meters:—Electrical Co., British Westinghouse Co., Chamberlain & Hookham, G.E.C., Ferranti, Ltd., and Siemens Bros. & Co. As the result of tests, Mr. Mark Ruddle, the City Electrical Engineer, recommended the acceptance of the G.E.C. tender, although the prices were not the lowest, owing to the smaller energy losses.  
**Ingleton.**—The tender of the Ingleton Electric Lighting & Power Co. for public lighting has been accepted.

### APPOINTMENTS AND PERSONAL NOTES

It is feared that Dr. Diesel, inventor of the engine bearing his name, has met with his death. He was on board the Antwerp-Harwich boat on Monday night, on his way to attend the Annual General Meeting of the Consolidated Diesel Engine Mfrs. Co., but was missing on Tuesday morning. On making inquiries at the Company's offices yesterday afternoon, we were informed that there was no further news of him.

Mr. Justus Eck, Engineer-in-Chief and General Manager of the Union Electric Co., is leaving by the R.M.S. *Majestic* on October 1st for a protracted tour in the United States.

The Exeter Electric Lighting Committee recommend that the salary of Mr. H. D. Munro, the Borough Electrical Engineer, be increased to £475 per annum, and that Mr. E. A. Chesnutt be appointed Mains Assistant at a salary of £90 per annum.

Mr. J. S. D. Moffet, who recently resigned the position as Tramways Manager at Rochdale to take up a similar opening at West Ham, has been presented with a canteen of cutlery from the Rochdale tramway officials and employees.

In consequence of the appointment of Mr. W. A. Turnbull, Assistant Engineer at the Stoke Works, as Electrical Engineer to the Aylesbury Council, Mr. C. Cuthbertson has been appointed Station Superintendent at the Stoke and Longton Works at a salary of £190 per annum. Mr. W. Adams has been appointed Station Superintendent at the central power

house and the Hanley Works, at a salary of £220 per annum. Mr. A. T. Gilbride, shift engineer at Burslem, has been appointed charge engineer at Longton at a commencing salary of £2 per week, and Mr. H. S. Digney, a switchboard attendant at Burslem, has been appointed shift engineer at £1 10s. per week.

We are asked to state that Mr. C. S. Luke has severed his connection with the *Engineering Review*, and, as joint managing director of W. Cawood, Ltd., will devote himself entirely to trade and other exhibition work.

Mr. H. B. Tilley, of Marconi's Wireless Telegraph Co., and formerly of Bruce Peebles & Co., was married on Thursday last at Chelmsford to Miss W. Norris.

The Derby Electric Lighting Committee recommend that the salary of Mr. E. G. Boissier, mains superintendent, be increased from £200 to £220 per annum.

Fife Electric Power Co. requires experienced cable jointer for paper, lead-covered, L.T. and E.H.T. concentric and three-core cables. (See an advertisement on another page.)

Mains superintendent required in Stoke-on-Trent Electricity Department. (See an advertisement on another page.)

Cable jointer required for nine months' engagement in Madras. (See an advertisement on another page.)

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £77 to £77 10s. (Last week, £77 15s. to £78 5s.)

**Agency.**—The Electrical Engineering & Equipment Co., Ltd. (109-111 New Oxford Street, W.C.), inform us that they have secured the sole selling rights in this country and the Colonies for the products of the Ateliers de Constructions Electriques, of Charleroi, Belgium.

**Canadian Agency.**—A Toronto firm wishes to get into touch with British manufacturers of A.C. machinery with a view to an agency. Further particulars at 73 Basinghall Street, E.C.

**Removal.**—The Sterling Telephone & Electric Co., Ltd., inform us that their offices and showrooms are to be transferred from Saturday next to Nos. 210, 211 and 212 Tottenham Court Road, W. Telephone, Regent 4144. The telephones will be manufactured at the Sterling Works, Dagenham, as heretofore.

**Dissolution of Partnership.**—R. S. Belsten and T. O. Morgan, trading as the Electrical Wiring & Accessories Co., 1 Boot Buildings, Aberdare, have dissolved partnership. Debts by T. O. Morgan.

### COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Electrical Power Storage Co.**—Particulars have been filed of an issue, on July 30th, of £5,000 debentures.

**British Westinghouse Co.**—The capital reorganisation scheme referred to in our last issue has been sanctioned by the shareholders.

**County of Durham Electric Power Co.**—An interim dividend of 2½ per cent. has been declared upon the preference shares.

**Victoria Falls & Transvaal Power Co.**—At the annual meeting last week the report and accounts given in our issue for September 18th were adopted. The Marquis of Winchester, Chairman of the Company, said that in January, 1915, the Company would have plant installed with a capacity of 265,000 h.p. Mr. A. E. Hadley, the Managing Director, said that the Company was at present supplying 145,000 h.p., whilst further business in sight represented an increase of 40 per cent. upon this. A careful study of power transmission in all parts of the world, he said, enabled him to inform the shareholders that the system of the Company was as up-to-date as it could possibly be, and that if he had to start again to-day he would not modify the installations in any way. The efficiency of the early stations which were supplying from machinery four or five years old showed no diminution, whilst the reliability was steadily improving. In addition to that, the plant was working with a lower consumption than he had seen in any other installation, and the tendency was to improve it still further.

## SUMMARY

THE "Ideal Home" Exhibition at Olympia, which opens to-day, includes a model house in which all kinds of electrical domestic appliances are demonstrated. (Page 566.)

THE "half-watt" lamp is already in the market in Germany; half-watt lamps are also being manufactured in this country, and stocks may be ready for the market in about four to six weeks. We illustrate one of these British-made lamps. We also publish an account of the investigations made in America which culminated in the production of the half-watt lamp. (Page 567.)

SOME of the difficulties which presented themselves in the electrical working of the Loetschberg tunnel are described in an article, which also gives some notes on the experience of seven years' working in the Simplon tunnel. In both cases the insulators of the high-tension contact line have given trouble under the conditions of dampness. (Page 569.)

AN illustration is given showing the style of lighting adopted in the vestibule of a theatre. (Page 570.)

THE setting of the gap of horn lightning arresters is dealt with in our Questions and Answers columns. (Page 571.)

A PATENT specification describing an elaborate process for the production of ductile tungsten suitable for the

manufacture of wire-drawn filaments was published by the Patent Office last Thursday. The specification is in the names of P. Schwarzkopf, S. Burgstaller, and Wolfram Laboratorium Dr. Ing. P. Schwartzkopf Ges. Among the other specifications published is one by Crompton and Co. and H. Burge for power factor regulation of self-exciting polyphase synchronous machines, and one for pliable filament supports by Wolfram Lampen A.G. Two patents expire during the week after a full life. (Page 572.)

IN announcing at an extraordinary general meeting of Marconi's Wireless Telegraph Co. last week the acquisition of the Goldschmidt patents, Mr. Godfrey Isaacs said there was not an atom of foundation for the statement recently made in the Press that the Goldschmidt station at Hanover had succeeded in transmitting wireless messages to the United States, at a regular rate of 100 words per minute for several hours.—A site has been acquired for a new 10,000 line telephone exchange in the City of London.—A small Strowger automatic telephone exchange is to be installed at Chepstow.—In order to avoid aeroplanes and airships coming into collision, at night, with the wireless aerials of the Telefunken station at Nauhen, a warning signal, consisting of two 1,000 c.p. metal filament lamps, has been fitted, so arranged as to give the Morse signal "N" continuously. (Page 573.)

THE construction of tube electric railways from the east to west of Glasgow is to receive consideration.—The Croydon Corporation has passed a resolution asking the Government to give effect to the report of the Select Committee on Motor Traffic at the earliest possible moment.—A proposal that first-class tramcars shall be run in Manchester has been rejected by the Tramways Committee. (Page 574.)

THE supply of coal to the Dublin electricity works is being interfered with by the labour troubles in that city.—The Countess of Glasgow will open the Glasgow Electrical Exhibition on October 23rd.—An increase of 30 per cent. in the number of units sold is reported by the Marylebone electricity undertaking for the June quarter.—The Poplar electricity accounts show a net profit of £3,170 for last year, during which period 72 gas lamps were converted to electric lighting.—The York Electricity Committee has been asked for a reduction in their charges for street lighting as the result of a reduction by the York Gas Co. for the portion of streets lighted by gas. (Page 574.)

THE Burnley Corporation requires a turbo-alternator, condensing plant, rotary converters, transformers, switchgear, boilers, &c.—An electrically driven pumping installation is required in Australia; mains at Bootle, Battersea, and Shanghai, and a 1,000 kw. generating set in Auckland (N.Z.).—Considerable extensions are contemplated to a number of electric lighting under-

takings in South Africa, and electrical supplies are required in a number of towns. (Page 575.)

A PROFIT of £18,600 is shown by Dick, Kerr & Co.'s accounts for the past year, compared with a loss of £8,600 in the previous year.—Callender's Cable & Construction Co. declare an interim dividend at the rate of 10 per cent. per annum, and 5 per cent. is recommended by Drake & Gorham.—An issue of £130,000 5 per cent. first mortgage debentures is offered by the Cleveland & Durham Electric Power Co., and an issue of capital is also being made by Edison Accumulators, Ltd. (Page 576.)

### ARRANGEMENTS FOR THE WEEK

SATURDAY, OCTOBER 11TH.

*Mining Institute of Scotland.*

3 p.m. At Heriot Watt College, Edinburgh. Among papers to be read is "The Electric Winding Plant at South Kenmuir Colliery," by W. M. Dunn.

MONDAY, OCTOBER 13TH.

*Institution of Post Office Electrical Engineers.*

6 p.m. At Institution of Electrical Engineers. "Telegraph Traffic and Power Plant for Pneumatic Tubes in Post Offices," by A. B. Eason.

WEDNESDAY, OCTOBER 15TH.

*Dynamicables.*

7.30 p.m. Dinner at Trocadero Restaurant.

FRIDAY, OCTOBER 17TH.

*Electro-Harmonic Society.*

8 p.m. Smoking Concert at Holborn Restaurant.

**The Association of Engineers-in-Charge.**—Dr. R. T. Glazebrook's Presidential Address to this Association, given last night, dealt with the bearing upon engineering practice of experiments made by reproducing phenomena by models where there are difficulties in the quantitative observation of the phenomena themselves. He instanced the well-known method of studying current distribution in conductors by the stream line experiments of Dr. Hele Shaw. He also described some of the methods employed at the National Physical Laboratory for investigating wind pressure, the aeronautical researches carried out in the wind channels and stream line tanks, and the work done on the resistance of models of ships in the Froude experimental tank. He indicated the nature of the result arrived at, and showed how useful they had been in the design of aeroplanes and ships.

### THE "IDEAL HOME" EXHIBITION

THE Ideal Home Exhibition at Olympia, which opens its doors to the public to-day, will be found quite cosy and comfortable, so that the exhibits may be seen to advantage. For instance, the large roof has been covered with canvas painted in the Pompeian style, and the arc lamps have been enclosed in braziers. Perhaps of chief electrical interest is "La Maison Electrique." This is a fully-equipped electric house containing pantry, kitchen, business office, dressing and bath-room, bedroom, and dining-room. Almost every kind of electric lighting available for domestic purposes, as well as apparatus for heating, cooking, ventilating, ironing, cleaning, polishing, &c., is shown. Very few duplicates of apparatus are found, and in no case are duplicates placed together in any one room. Apertures are cut in the walls so that visitors may look in, and those interested will be conducted over the building by a special staff of attendants. In the dining-room is a dining-table fitted with electrophone, periscope, service lift, and travelling-rails on which a car runs, so that the diners' wants are administered without visible human presence. This equipment has been brought over from Paris. The exhibit has been arranged by the Electric Supply Publicity Committee.

After the "Maison Electrique," the most important stand of electrical appliances is that of Rashleigh Phipps & Co. (147 Oxford St., W.). Here one sees a variety of fittings, cooking apparatus, irons, an electrically-driven sewing machine, lamp radiators, as well as a petrol-electric set. These appliances are all supplied by the General Electric Co., Ltd. Besides numerous self-contained cooking utensils, there is a cooker and a new design of a cheap air-lagged oven with polished external walls. It has top and bottom elements, and provision for boiling at the same time is provided. A feature is also made of the self-contained utensils and irons in which a design of the "Archer" easily replaceable element is used. On this stand also may be seen several fine designs of the glowing fire radiators made by Belling & Co. (Edmonton, N.). In proximity to this stand, which occupies a prominent position on the ground floor near "La Maison Electrique," will be found the exhibit of the Dowsing Radiant Heat Co., Ltd. (115 Great Portland Street, W.). This firm manufactures almost every kind of radiator and convector, and a very representative display is made, while some cooking apparatus, vibrators, and the "Solarium" electric bath are also on view. In addition, the British Electric Vacuum Cleaner Co., Ltd., the Linolite Co., Electric Appliances, Ltd.,

In view of the variable state of the climate Mr. Blinks has prepared two fine placards, one adjuring his customers to warm themselves with his electric radiators, and the other pointing to the small heating effect of electric lamps. A new window-dresser has used them simultaneously with the above disastrous result.

and some other firms have representative exhibits. The model house fitted up by Arding & Hobbs, Ltd., contains interesting half-hundredweight service lift without a permanent receiving cabinet. This comes through the floor in advance of the lift proper. It was supplied by F. Hodgson & Co. (24 Queen Victoria Street, E.C.). A display of automatic petrol-electric sets and equipment for country houses is

made by Spensers, Ltd., and some very handsome examples of electric light fittings are to be found on the stands of many other exhibitors. A brilliant arc and incandescent lighting scheme has been arranged for the Russian Village. Edmundsons' Electricity Corporation will also have a good display, but this was not ready at the time of our representative's visit.

## HALF-WATT LAMPS

THE "half-watt" lamp has now been placed on the market in Germany by the AuerGesellschaft (who are the makers of the Osram lamp in that country), and the Allgemeine Elektrizitäts Gesellschaft (the makers of the Aegma lamp), and these two makes are being advertised in our German contemporaries.

A short article on the new Osram lamp, published in last week's *Elektrotechnische Zeitschrift*, states that the efficiency is in all cases half a watt per mean hemispherical Hefner candle, and four sizes are listed:—600 c.p. for 50 to 65 volts; 1,000 c.p. for 50 to 65 and 100 to 130 volts; 2,000 c.p. and 3,000 c.p. both for 100 to 130 volts and 200 to 240 volts. The filament is of drawn wire, and the bulb is filled with an inert gas at atmospheric pressure. The average life is given as 800 hours. These lamps are suitable for both D.C. and A.C. circuits, and can be run in series if desired.

In this country half-watt Osram lamps may reasonably be expected to be on the market in about four or six weeks' time. The Osram Lamp works are already busy manufacturing and accumulating stock, but are not proposing to issue lists or to sell the lamp until they have sufficient stock in hand to make deliveries in quantity, as, of course, a very great demand is anticipated. Figs. 1 and 2 are drawings which we have

FIG. 1.—ENGLISH-MADE 2,000 C.P. "HALF-WATT" OSRAM LAMP,  $\frac{1}{4}$  SIZE.

FIG. 2.—THE FILAMENT FULL SIZE.

made of one of the British-made lamps (rated at 2,000 c.p. and 220 volts) shown us by Mr. Hugo Hirst, Chairman of the General Electric Co., on Tuesday. As will be seen from Fig. 2, which shows the filament on a larger scale, the filament is a closely-wound helix of drawn wire, bent in a zig-zag form, and supported by comparatively thick wires from a ring of fire-clay.

Fig. 4 is a drawing of the A.E.G. half-watt lamp in its lantern, and it is seen that the lamp is in many respects similar to the Osram. The A.E.G. Co. are calling it

the "Nital" lamp. The Electrical Co., their selling agents in this country, have favoured us with a copy of the German company's list of these lamps. The candle-powers and voltages are the same as those mentioned above for the Osram lamp, except that the 2,000 and 3,000 candle-power sizes are both made for three ranges of voltage: 50 to 65, 100 to 130, and 200 to 240. The price of the "Nital" lamps in Germany is

FIG. 3.—A.E.G. "NITAL" LAMP IN LANTERN.

15 M. for the 600 c.p. size, 18 M. for the 1,000 c.p., 27 M. for the 2,000 c.p., and 36 M. for the 3,000 c.p., to which is added the German lamp tax of 1'40, 2'20, 4'20, and 6'20 marks respectively. The above prices are for the lamps alone; an additional 20 to 27 M. must be added for lanterns. The diameter of the lamp itself varies from  $4\frac{1}{2}$  ins. to  $9\frac{1}{2}$  ins. according to candle-power, and the globes of the lanterns from 9 ins. to 12 ins. The life of the "Nital" lamps is estimated at 800 hours.

An interesting article on the half-watt lamp appears in the October issue of the *General Electric Review* describing the course of the experimental work which led to the development of this lamp at the research laboratory of the American General Electric [Thomson-Houston Co.] in Schenectady. It was first noted that ordinary tungsten lamps blackened badly within a couple of hours at 0.5 watt per candle, and it was concluded that unless this could be prevented the running of lamps at this high efficiency would be impossible. An investigation was therefore carried out to find the real cause of the blackening of bulbs and the laws governing it. The article continues:—

It had long been a theory that blackening was largely, if not entirely, due to the presence of gas in the bulb. The gases given off by the filament, by its supports, by the bulb, and the residual gases left on exhausting, were therefore measured and analysed chemically, although often the quantities involved were less than a cubic millimetre. A systematic study was then made of the effects that were produced in lamps by the introduction of these (and other) gases in varying quantities into lamps. This showed clearly that only one of them, namely, water vapour, always known to be detrimental, ever produced blackening of the bulb. The action of water vapour was, therefore, studied in detail, and it was found that it attacked the filament, producing a volatile oxide of tungsten and atomic hydrogen. The oxide that thus collected on the bulb was then reduced by the atomic hydrogen. The deposit was thus changed to a black layer of metallic tungsten, while the hydrogen combined with the oxygen to form water, which again acted on the filament. The action of water vapour was thus a cyclic process by which large amounts of tungsten could be carried from the filament to the bulb by very small quantities of water.

Efforts were then made to study the relation between the amount of water vapour on the bulb and the rate of blackening by this cause. Pressures of water vapour even as low as 0.0001 mm. were found to produce very rapid blackening, and, by methods of exhaust especially adapted to the removal of water vapour, it was finally proved that the blackening of bulbs with filaments at high temperature goes on even in the absence

of water vapour. This kind of blackening was considered probably due to ordinary evaporation.

To test this theory, quantitative experiments were made to determine the rate of loss of weight of tungsten filaments in vacuo when run at various temperatures. This work conclusively showed that the cause of the blackening of ordinary well-made tungsten lamps, as well as those run at higher than their rated efficiency, is simple evaporation. On the other hand, the rapid blackening of poorly-made lamps is due largely to the presence of water vapour.

To increase the efficiency, therefore, either the rate of evaporation would have to be decreased or the evaporated material would have to be prevented from blackening the bulb. These considerations led to several different methods of attack, of which the following are particularly interesting:—(1) Introduction of gases, such as nitrogen or mercury vapour at atmospheric pressures into the lamp bulb. (2) Changing the location of the deposit by means of convection currents in gases, so that the bulb opposite the filament does not darken. Each of these methods has been tried with marked success.

The use of a gas at high pressure causes the loss of heat from the filament by convection. This makes it necessary to run the filament at a higher temperature than in a vacuum even to get the same efficiency. The question then arose: Are the advantages to be gained by the use of a gas sufficient to offset the tendency for an increase in the rate of evaporation owing to the higher operating temperature? Simultaneously, with a large part of the preceding work, several investigations on the heat losses of wires in various gases had been under way. It had been found that the heat lost by convection increases only approximately as to the 1.5th power of the temperature of the filament. The radiated energy, on the other hand, increases with about the 4.7th power of the temperature. At very high temperature the effect of convection currents therefore becomes relatively small. It had also been found that the heat loss by convection from small wires at high temperatures is very nearly as great as that from wires several times as large in diameter. In other words, the cooling effect of the gas on the filament is much more serious in the case of small filaments than in the case of large ones. For example, a straight filament 0.001 in. in diameter run in nitrogen at atmospheric pressure and at a temperature corresponding to that of a filament running at 1 watt per candle, will give an efficiency of only about 4.8 watts per candle. On the other hand, a filament ten times as large (i.e., 0.010 in.) will give at the same temperature an efficiency of 1.59 watts per candle. It is thus of great importance to use filaments of large diameter. Practically the same effect can be obtained by winding the filaments into the form of a tightly coiled helix.

From the above considerations it is clear that the larger the diameter of the helix the higher the efficiency that may be obtained. The diameter of the helix is ordinarily limited by the sagging which is apt to occur if the mandrel on which the helix is wound is too large in proportion to the size of the wire.

With helically wound filaments in nitrogen very high efficiencies can be obtained, and yet the life of the filament may be more than 1,000 hours. The blackening of the bulb is avoided; and in properly designed bulbs the tungsten that evaporates produces only a slight brownish deposit in the upper part of the bulb, where it does no harm. A number of types of nitrogen-filled lamps have been made and tested. Among these the most interesting for the present are perhaps the following:—

1. *Large units of very high efficiency.* (0.4-0.5 watt per candle with a life of 1,000 hours or more.) These take currents of at least 20-30 amperes, and (except in units over 4,000 candle-power) are therefore best run from A.C. circuits through small transformers.

2. *Smaller units of low voltage.* These take currents of ten amperes or less, at voltages, in some cases, as low as four or five volts. The efficiencies with 1,000 hours' life vary from 0.6 to 1 or even 1.25 watt per candle, according to the current used. These lamps are adapted for automobile headlights and in general, wherever a source of high intrinsic brilliancy, steadiness, and white colour is needed.

3. *Lamps to run on standard lighting circuits* (110 volts). Large units of this type (several thousand candle-power) have efficiencies of 0.5 watt per candle or better. With smaller units the efficiency is ordinarily not so high.

The temperature of the filament being several hundred degrees higher than that of ordinary tungsten lamps, causes the light to be of a very much whiter colour, so that it comes closer to daylight than any other form of artificial illuminant except the direct-current arc and the special Moore tube containing carbon dioxide. By the use of special colour screens it is possible to obtain a true daylight colour at an efficiency of about 2 watts per candle, whereas with ordinary tungsten lamps the efficiency obtained with the proper screens is only 10-12 watts per candle.

Because of the freedom from blackening of the bulb in these lamps, and because the helically-wound filaments may be so designed that the sagging compensates other changes during life, it is possible to make nitrogen-filled lamps which maintain their volt-ampere candle-power characteristics practically constant during their whole life. The ultimate failure of these lamps is due to the breakage of the filament. The candle-power is usually well above 80 per cent. even just before failure.

In an editorial note at the commencement of this article, it is stated that a Paper on the subject will shortly be read before the American Institute of Electrical Engineers by Dr. Irving Langmuir.

As was announced in our issues of August 28th and September 4th, the British Thomson-Houston Co. are actively occupied with the manufacture of the half-watt lamp, and although, as in the case of other lamp manufacturers here, no definite date has been fixed for its appearance on the market, we may hope that it will be in evidence within a comparatively short time.

Siemens Bros. Dynamo Works Lamp Department inform us that, although they have not yet started manufacture of half-watt lamps at Dalston, they will be commencing to do so shortly, and they, as other manufacturers, prefer not to state any definite date yet upon which their lamps will be actually on sale. They have given us a list of the candle-powers and voltages which they will supply; these are the same as those of the other makers mentioned. The diameters of the bulbs will be as follows: 600 c.p., about 6 ins.; 1,000 c.p., about 6½ ins.; 2,000 c.p., about 8 ins.; and 3,000 c.p., about 9½ ins.

**Model Engineering and Scientific Exhibition.**—The fourth exhibition of models, tools, and scientific apparatus, organised by the proprietors of *The Model Engineer*, will be held at the Royal Horticultural Hall, Westminster, S.W., from October 10th to 18th. Besides numerous working models a special section will be devoted to wireless telegraphy. The exhibition will be open from 12 a.m. to 10 p.m.

**The Gas Exhibition.**—The most interesting feature, from the electrical engineer's point of view, of the Gas Exhibition now being held at Shepherd's Bush is that large electric fans are used for ventilating the hall. This, we believe, is an addition to the building which was insisted upon by the London County Council, and, to judge by the hot air and fumes arising from the gas apparatus exhibited, it seems to be very necessary.

**A Lamp for Colour Matching.**—The Edison & Swan United Electric Light Co. have introduced a special metal filament lamp by means of which colour matching may be carried out with as much reliability as by daylight. A special tinted glass is used for the bulb, which intercepts such rays as are present in too strong a proportion, and produces an effect approximating to daylight. This new lamp is to be known as the Royal Ediswan daylight lamp, and in addition to its great superiority over other incandescent lamps for colour matching, it forms a capital reading-lamp, and is most restful to the eyes. All sizes are supplied.

**Mica.**—An interesting monograph entitled "Mica: its History, Production and Utilisation," by Hans Zeitler, has just been published in book form in English by D. Jaroslaw (19 Tower Hill, E.C.) at the price of 2s. 6d., but we understand the firm will be glad to present copies to responsible officials who are interested in the subject. The work gives an interesting historical account of the growth of knowledge of the features of this mineral, and discusses with thoroughness its physical and chemical properties. The geological occurrence of the different varieties is treated of, and there are interesting notes as to the method of mining in various parts of the world. Not the least interesting portion is that devoted to the applications of mica, of which its utilisation as an insulating material in electrical machinery forms an important part. An appendix contains statistical tables of production and consumption of mica. The book is well illustrated, and will be read with interest by those who are in any way connected with the industries in which mica figures.

**University and Technical College Announcements.**—A course of eight lectures on the design, construction, and testing of electric power cables will be delivered by Mr. H. Savage (W. T. Henley's Telegraph Works Co.) at the East London College (Mile End Road, E.), on Mondays, commencing October 20th, from 7 till 8 o'clock. The fee for the course is one guinea, but apprentices and engineering employes under 25 years of age, and earning less than one guinea per week, are admitted at half rate. Fuller particulars may be obtained on application to the Registrar or the Principal, Mr. J. L. S. Hatton.

The Goldsmid Entrance Scholarship to the Faculty of Engineering at University College has been awarded to H. P. Gardham, of Bancroft's School. The scholarship is of the value of £30 a year, and is tenable for three years.

A course of advanced lectures on wireless telegraphy, by Mr. J. V. Pletts, will commence in November at the City and Guilds Engineering College, South Kensington.

## EXPERIENCES WITH ELECTRIC TRACTION IN THE LOETSCHBERG AND SIMPLON TUNNELS

SOME further particulars are to hand of the troubles experienced on the new Loetschberg Railway since the opening of the tunnel. It will be remembered that single-phase locomotives are employed, working from a 15,000-volt, 15-cycle contact line.

The line was opened to a certain amount of traffic on July 15th last, but after a few days' running the trains were often several hours late, and were even at a standstill in the tunnel for long periods at a time. Writing in the *Elektrotechnische Zeitschrift* of September 25th, Dr. Breslauer states that the troubles were caused by the undue haste of the railway company in opening the line, against the wishes of their technical adviser who desired first to give the equipment a thorough test. The chief source of disturbance is said by him to have been faulty insulators which, it is supposed, were damaged during erection. The line pressure employed even in the tunnel is 15,000 volts 15-cycle single-phase, and the insulation is, in Dr. Breslauer's opinion, ample and well designed from an electrical standpoint. Further trouble has been reported from the excessive static charges on the contact line, due to differences of altitude. The height at Spiez is 1,980 ft., and the air is moist, while at the south end of the tunnel the altitude is 4,100 ft., and the air is dry. From this point the line runs down again to Brigue, where the level is 2,240 ft. These charges have been eliminated by the installation of water-jet static dischargers. According to a Swiss contemporary, the bow collectors have also given trouble. Slight subsidences of the track have taken place in the tunnel, and as the bow collectors are necessarily restricted in size on account of the shape of the tunnel section, these subsidences are said to have caused the bows to run off the contact wire. Dr. Breslauer states that the rolling stock has proved satisfactory with one or two exceptions. The locomotives were supplied partly by Brown-Boveri and partly by the Oerlikon Co., and have each two single-phase commutator motors of a capacity (for one and a half hours) of not less than 2,500 h.p., while at a speed of forty miles per hour they run at about 600 r.p.m. The gradients reach from 3 to 3.5 per cent. On two or three occasions the transformers on these locomotives have broken down in the end turns, this being attributed not to the design, but to the excess voltages mentioned above. The motor commutators have also given trouble, but this has been traced to too great a pressure on the brushes. Some mechanical troubles are reported also, notably straining of the triangular coupling rods on the driving wheels. The fact that the equipment of the repair shops at Spiez was not completed also resulted in serious delay in making good the several defects. Most of these faults have now been remedied, however, and the normal schedule is now being run with the exception of a few night trains.

In this connection, interest attaches to the practical experience gained during the seven years' electrical working of the Simplon tunnel line, which was discussed in a long article by Herr B. Kilchenmann in a recent issue of *Elektrische Kraftbetriebe u. Bahnen*. Current is supplied to the locomotives at 3,300 volts, three-phase, 16 cycles per sec. The overhead construction on the eighteen miles of line has proved satisfactory with certain exceptions. No trouble due to expansion and contraction on temperature variation has occurred, although no automatic tensioning devices are employed. Owing to the heavy deposit of soot and dust on the insulators, however, it is necessary to overhaul and clean the whole equipment twice a year to discover faulty insulators. The horizontally-arranged bell-shaped insulators have been found unsuitable for tunnel work owing to the presence of moisture, and the hard-rubber insulated bolts used for attaching the contact wire had to be replaced in some places every six or eight weeks. The moisture was found to cause surface sparking over the rubber, which burnt in the soot and dust until it broke down. An attempt to protect the rubber with a porcelain sleeve was unsuccessful. Corrugated porcelain insulated bolts substituted for these gave better results, but this feature of the equipment is not yet entirely satisfactory. Glass-insulated bolts have been tried now for some months with considerable success. The wear on the contact wire has been slight only, being generally only 0.3 to 0.4 mm. after some 80,000 passes of the collector bows. In some places where water containing tufaceous limestone in solution drops on the wire, the wear is 0.7 to 0.8 mm., and these parts correspond with the sections of greatest rail wear. No abnormal wear has occurred at the points of suspension, although the wire is suspended with out a catenary and with spans of from 90 to 115 ft. At the

south entrance of the tunnel, however, the copper wire is subject to oxidation to such a degree that some one and a quarter miles of wire had to be renewed in 1912, i.e., after six years' wear. The reduction in weight was only 7 per cent., but the oxidation had become more rapid during the last few months, and it was considered safest to change the wire. No iron or steel was employed in the overhead equipment of the tunnel, as this would not endure two years in the presence of so much soot and moisture. Experiments have shown that copper wire will stand the warm moisture only when no soot is present. The trouble would therefore be obviated if it were possible to stop running steam trains through the tunnel, but this will not happen until the electrification is extended to Domodossola. The new section of copper wire has been coated with various kinds of paint over different sections, and the effect of this will be awaited with interest. Icicles formed in winter on the contact wire by dropping water at the north end have proved troublesome. This has been partially overcome by drawing the ventilating air through a 3-km. auxiliary tunnel to warm it before it enters the main tunnel; but in the construction of the second main tunnel an attempt will be made to eliminate the dropping water. This is also necessary to reduce the corrosion of the rails. The metal paste rail bonds have not proved satisfactory. A test showed that over 60 per cent. of the traction current was returning through the earth. Copper bonding is now being substituted, the holes being bored by pneumatic tools supplied from a locomotive brake equipment. These bonds have increased the rail conductance by 50 per cent. In spite of the severe conditions the locomotive equipments have given no trouble. On account of the rapid changes of temperature and the consequent condensation effects, short-circuits were experienced in the switching apparatus, and had the pressure been much over 3,300 volts these would have been most serious. These troubles have been partially overcome by painting all live parts except contact surfaces with an insulating varnish. Oil-immersed switches would be employed if there were space on the locomotives. The motors of one locomotive were not overhauled until after some eighteen months, or about 37,000 miles running; but this is now done every nine or ten months, a complete overhaul of the locomotive taking place every three years. The switching apparatus is overhauled at times by the locomotive attendants. By giving the contact wire a double zig-zag on either side of the centre line alternately, instead of a simple zig-zag across the centre line, the life of the bows has been increased from 1,600 miles to 4,500 miles, as the wear is thus evenly distributed over the whole width. A better arrangement of the locomotive springs, with, in particular, longer springs, is recommended, as with the present construction heavy vertical oscillations are noticed directly the journals show the slightest wear. The monthly runs of the four locomotives have averaged 4,600 miles, which is good considering the severe conditions. The consumption has been 53 to 56 watt-hours per ton mile inclusive of the locomotive weight. This high figure is accounted for by the air resistance in the tunnel. When running against the ventilation current the traction resistance, excluding the effect of the gradient, amounts to 24.7 lb. per ton at 43.5 miles per hour.

**The "Northampton" Gazette.**—This publication, which is now to be issued regularly at least three times a year, contains, in the issue dated September, a report of Mr. S. M. Hill's Presidential address to the "Northampton" Past Day-Students' Association. The address deals with the aims and objects of the Association, and incidentally gives some interesting sidelights on its working. In addition to book reviews, the remainder of the journal is devoted largely to purely personal notes.

**"Job-Line" Wire.**—Judgment was given on October 3rd, by Judge Woodfall, at the Westminster County Court, in favour of Mr. A. E. Corfield, receiver for the debenture holders of the Davis Electrical Co., Ltd., in the action which he brought against Mr. G. Cohen (Premier Electric and Hardware Co.), to recover £34 for the supply of cable. The earlier proceedings were noted in *ELECTRICAL ENGINEERING*, August 14th, p. 466. The cable supplied was sold as "job-line" cable, and was used for house wiring. It proved faulty, and although Mr. Cohen did not pay for it he ordered more, and when the claim was made he entered a counter-claim for £70, because his reputation had suffered. Evidence was given by several electrical engineers, including Mr. H. J. Wright, of 15 Garlick Hill, E.C., who represented the firm who made the cable, that the term "job-line" meant that the goods were sold with all their faults, and without any guarantee. The cable was said to have been made as to 70 per cent. in England.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**"CAB-TYRE" SHEATHED CABLE.**—Callender's Cable & Construction Co., Ltd. (Hamilton House, Victoria Embankment, E.C.), which supplies "cab-tyre" sheathed cable made under the St. Helens Cable Co.'s patent, has issued a catalogue bearing the motto, "To be bent not to be broken," giving particulars of all sizes of this cable. It is made in 600 megohm, 2,500 megohm, and 600-volt grades, with single, twin, three or four conductors, and either flexible or inflexible.

**CARBON FILAMENT LAMPS.**—A list to hand from the Edison and Swan United Electric Light Co., Ltd. (Ponder's End, Middlesex), gives the company's latest prices and designs of Royal Ediswan carbon filament lamps. In addition to the standard lamps with B.C. or E.S. terminals, there are numerous fancy-shaped lamps, as well as traction and ship side-light lamps, candle lamps, radiator lamps, "tubolite" lamps, &c.

**ARC LAMP-LOWERING GEAR.**—A new issue of its price list and general specification of arc lamp-lowering gear, winches, and accessories has been made by The Arc Lamp-Lowering Gear Co. (Darlington). The sole agents for the Company in the London district are Neale & Freund, Ltd. (31 Budge Row, Cannon Street, E.C.). The construction of the many contrivances listed is clearly shown by the aid of detail drawings, while full particulars and prices are conveniently given.

**ELECTRIC FIRES.**—A new season's catalogue dealing with red-hot electric fires has been issued recently by Redglo, Ltd. (Royal Liver Building, Liverpool). Included are a number of assorted designs in which the Redglo elements are adapted for domestic use. In particular, we notice some fine designs specially suited for use as fire screens, the globular heating element in the centre enhancing their otherwise bold appearance. The consumption of each element is 600 watts, and the standard fires contain one, two, or three of these elements.

**WORKING OF STEAM BOILERS.**—The fifth edition of that useful publication entitled "Working of Steam Boilers" has just been published by Taylor, Garnett, Evans and Co., Ltd., of Manchester, at the price of 1s. 6d. paper boards, and 2s. cloth. A number of useful particulars and telling photographs of boiler deterioration, as well as constructional drawings, are given. The author is Mr. E. G. Hiller, who is the chief engineer of the National Boiler and General Insurance Co., Ltd. (Manchester).

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**ELECTRICAL AND MECHANICAL MACHINERY.**—In harmony with the excellence of the multitudinous products of Vickers, Ltd. (Vickers House, Broadway, Westminster, S.W.), is the illustrated booklet of 66 pages which the company has produced in connection with its exhibits at the Ghent Exhibition. The letterpress is in both English and French, and describes the various specialities which the company is showing. One of these is a Stirik horizontal table planer fitted with Vickers reversible drive, which is interlocked and fitted with push-button control, and another is the Vickers system of train lighting, in which a battery of accumulators in conjunction with a four-pole axle-driven dynamo is used. The fluctuations in pressure are regulated by field resistance controlled by a specially designed solenoid. In addition may be mentioned some electrically driven drills, turret laths, and other machine tools, electrical appliances, including circuit-breakers, massive control pillars, &c., while aeroplanes, motor-cars, and the necessary engineering accessories are also dealt with. A fine coloured plate of a battleship at sea and other photographs serve to remind one of the firm's energies in this direction.

**OPAL REFLECTORS.**—A folder has been issued by the Benjamin Electric, Ltd. (117 Victoria Street, S.W.), in connection with "Marbella" opal reflectors—concentrating and distributing types. These were illustrated in last week's *ELECTRICAL ENGINEERING*, p. 554.

**"LIGHTING NEWS."**—No. 2 of this B.T.H. publication has recently been produced. It is on similar lines and of the same size (4½ in. by 3½ in.) as No. 1, which we reviewed last year. The success which we predicted has been more than realised, for we understand that over 300,000 copies were disposed of during the past season by retailers, central-station departments, &c. The features of the present issue consist of short and bright articles, with illustrations and notes, calculated to induce non-users to become users of electricity, and to demonstrate to partial users how greater benefits may be obtained by a more extended use. Electrical engineers, contractors, and central-station men are invited to write at once to the British Thomson-Houston Co., Ltd. (77 Upper Thames Street, E.C.), stating the number of copies required and giving details of overprinting. All requisitions will be filled within three days of receipt, unless they arrive when the 250,000 copies already printed are disposed of.

**FLAME ARC LAMPS.**—A new and complete catalogue dealing with the Crompton-Blondel flame arc lamps has been issued by Crompton & Co., Ltd (Arc Works, Chelmsford, Essex). These lamps are of the open type with vertical carbons, the larger mineralised carbon being the lower one, and the economiser is of metal specially shaped to direct the air currents and to act as a reflector. The carbons are differentially controlled through a brake wheel. The present list illustrates different types of lamp for special purposes both on A.C. and D.C. circuits. Lanterns, raising and lowering gear, auto-transformers, &c., are also dealt with, and the publication is brightened by photographs of various installations.

**MERCURY VAPOUR LAMPS.**—A leaflet from the Westinghouse, Cooper Hewitt Co., Ltd. (80 York Road, King's Cross, N.), illustrates 500 and 1,000 c.p. mercury vapour lamps for 50-65 volts and 100-130 volts respectively. In addition to the numerous industrial and commercial premises where these lamps may be used to advantage, they are advocated for hosiery and other works of a similar nature. A number of installations have been made in the Nottinghamshire and Leicestershire districts. The tubes are guaranteed for 1,000 hours, though the average life is about 4,000. The efficiency is 0.33 watt per c.p.

**FLAMING ARCS.**—A folder from the Engineering & Arc Lamps, Ltd. (Sphere Engineering Works, St. Albans, Herts), draws attention to the "Beaconette" flaming arc lamp. This is a modification of the well-known "Beacon" lamp, and is of attractive appearance and moderate price.

## THEATRE LIGHTING

THE illustration below, which has been sent us by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), represents the vestibule of the London Opera House, illuminated by Osram drawn-wire lamps. Some idea of the lighting value of these lamps can be gained from the fact that the photograph was taken entirely by their light. Osrams are installed also in the whole of the auditorium; in fact, they form the principal illuminant throughout the

VESTIBULE OF THE LONDON OPERA HOUSE.

theatre. Leading provincial theatres, &c., are also realising the value of efficient and economical lighting, and among the latest to use Osram drawn-wire lamps are the "Theatre Royal," the "Hippodrome," and the "Palace" at Oldham.

**20,000 K.V.A. Turbo-generators.**—The first of two 20,000 K.V.A. turbo-generators has just been installed by the Allgemeine Elektrizitäts Gesellschaft in the Oberschlesische Elektrizitäts Werke power station at Chorzow, Upper Silesia, Germany. According to the *Elektrotechnische Zeitschrift* it is a 1,000 r.p.m. machine, generating at 6,000/6,500 volts, three phase. The steam consumption is not given. At 6,400 volts the current is 2,000 amperes, and this is taken through eight three-core cables direct to a group of auxiliary bus-bars. These bus-bars are connected to the main bus-bars by three automatic oil switches in parallel, as it was thought inadvisable to deal with so large a current with one oil switch. These switches have reverse-current relays, but not overload relays, and are operated simultaneously by remote control. Ammeters are connected in each switch circuit, so that any inequality in the division of the current can be detected. The generator is paralleled on one of the three switches. Any one can be inspected and repaired without taking the generator off the load, by opening the isolating switches on either side of that particular switch.

# QUESTIONS AND ANSWERS BY PRACTICAL MEN

## RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,359.

Show by examples how to design wood formers on which three-phase stator "symmetrical and asymmetrical" coils are wound.—"COIL."

(Replies must be received not later than first post, Oct. 16th.)

### ANSWERS TO No. 1,357.

In horn lightning arresters, what clearance of gap is allowed per 100 or 1,000 volts?—"SPARK."

The first award (10s.) is given to G. A. P., who writes as follows:

The gap clearance of horn lightning arresters is not expressed as so much per 100 or per 1,000 volts, as the gap is not related to the flash-over pressure according to a straight line law. Further, horn arresters should not be used on systems of less than 3,000 volts working pressure, as the gap then required (e.g., a gap to flash over at 6,000 volts) is so small that it is difficult to set accurately, and is easily bridged by dust. The

FIG. 1.—THEORETICAL AND MANUFACTURERS TEST CURVES FOR HORN ARRESTER GAP SETTINGS.

curves given in manufacturers' pamphlets showing the relation between gap and flash-over pressure are deduced from tests on particular arresters, and are quite empirical and suitable only for the arresters they refer to. The curves in text-books are generally useless, as they take no account of the diameter of the rods forming the horns, that is, the radius of curvature of the electrodes. This radius of curvature has a large influence in determining the flash-over pressure, the problem being almost the same as the determination of the critical voltage for corona effect and the insulation of extra high pressure cables. Neglecting the curvature of the rods in an axial direction, which is generally so small as not to affect the result, the flash-over pressure is expressed mathematically by

$$V = 4.605Sr \sqrt{\frac{a}{a+4r}} \log \frac{\sqrt{a^2+4ar+a}}{\sqrt{a^2+4ar-a}}$$

where  $2r$  is the diameter in centimetres of the rod forming the horn,  $a$  the gap in centimetres, and  $S$  the average breakdown pressure of air, which is about 25,000 volts per cm. at normal barometric pressure. The derivation of this formula is given by K. Grütter in the *Schweizerische Elektrotechnische Zeitschrift* of July 12th, 1913. Fig. 1 shows curves plotted for arresters of rod of 4, 5, 6, and 8 mm. in diameter, and also three test curves submitted by different manufacturers. The diameters of the rod in these cases are unfortunately not given. It would appear that the 8 mm. theoretical curve is correct for ordinary arresters, which doubtless have this radius of curvature of 4 mm. for the electrodes. It must be remembered, however, that the breakdown pressure of air varies very considerably with the state of ionisation of the atmosphere and the atmospheric pressure. Thus in hot, dry weather the gaps would break down at lower voltages owing to the ionised state of the air, while they will also break down at lower voltages when installed at high altitudes owing to the lower atmospheric pressure. These effects have, however, not yet been quantitatively investigated.

A simple horn gap is not satisfactory on a power system of any size and importance. To limit the current flowing to ground through the arc after a discharge has taken place, a resistance must be connected in series with the gap. But this resistance generally burns out if a heavy dynamic surge takes place, and so it is now usual to have two arresters in parallel, one set to discharge at, say, twice normal voltage, and with a fairly high non-inductive resistance to limit the current flow;

FIG. 2.

FIG. 3.

and one set for a higher pressure, but with only a very low or no resistance, to take care of the heavy surges. The former takes care of small surges and static charges. In some recent designs, the low resistance big gap arrester has an auxiliary electrode set close and connected to earth through a high resistance to deal with these small discharges (Fig. 2). In a horn arrester the arc is blown up by the heated air and the electrodynamic action until it breaks. To reduce the length of the arc and the space required above a horn gap, two arresters may be connected in series. The gap of one may be set close, and the other may be shunted by a high resistance to lead off small charges. A heavy surge will cause a flash over across both gaps in series (Fig. 3).

The second award (5s.) is given to S. F. for the following reply:—

The width of gap does not vary in direct proportion to the spark voltage. This would be true only if the points between which the spark passes were of infinite sharpness. Various formulæ have been produced by different authors, but they vary considerably presumably on account of the many varying

FIG. 4.

factors. Fig. 4 shows the relation between the air gap and the spark voltage from actual test. The voltage is given in R.M.S. values and maximum values assuming a sine wave. The con-

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published October 2nd, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

13,282/12. **Manufacture of Ductile Masses of Tungsten, &c.** P. SCHWARZKOFF, S. BURGSTALLER, and WOLFRAM-LABORATORIUM DR. ING. P. SCHWARZKOFF GES. The object of the invention is to produce a mass of tungsten, molybdenum, &c., of uniformly small crystals suitable for drawing into wires for metal filament lamps. The process consists in the reduction of the oxides of the metals by carbon after they have been consolidated by pressure in moulds. These oxides should be in the form of a fine-grain powder, each particle of which contains a lower proportion of oxygen than the lowest oxide of the particular metal. Sintering is effected at the same time as the reduction by the use of an adjustable current of hydrogen. The rate of removal of the oxygen, in order to regulate the size of the crystals produced, is effected by the addition of an adjustable quantity of an indifferent gas, so that the partial pressure of the oxygen is regulated. At the same time, the rate of flow of the reducing gas and the rate of travel of the pressed material, as well as the temperature, may be regulated. Furthermore, a metal or compound which is not decomposed at the temperature to which the finished body is to be submitted may be added to the pressed material. The action of the added metal (uranium is suggested) is to lower the vapour pressure without substantially lowering the melting-point of the main metal.

20,831/12. **Sealing and Junction Boxes.** H. H. R. GREEN. The casing is longitudinally slit or slotted so that it can be slid or sprung on the cable. The ends are clamped to the cable sheathing, and the casing is then filled with the sealing compound, and a cover with a projection to engage the slot is affixed. Eight figures.

21,971/12. **Conduit Fittings.** E. P. COTTIER and H. L. DOWNES. The elements of the fittings are divisible longitudinally, and are fitted together by removable metal bands. To ensure accurate positioning, a tongue in one member engages a recess on the adjacent member. Thus the cables may be easily inspected. Three figures.

23,402/12. **Controller Contact for Heavy Currents.** J. DAWSON. The contact piece consists of a thick disc or roller mounted on a spindle between the flanges of the finger-bar web so that a series of adjustments by a stud or set screw passing through the web into a lapped hole in the disc may be made. The web or flange is slotted for the adjusting stud. Four figures.

24,131/12. **Water Heaters.** J. NATHAN. A compact construction of a heating element for steam tables, percolators, &c., in which the current passes through the water between electrodes, is described. Four figures.

25,536/12. **Tubular Porcelain Reflectors.** F. W. SUTER. Trough-like reflectors of porcelain or other moulded material are made with end pieces containing the plugs and sockets (for making up into a continuous length) connected through the trough-like part by pins or plugs smaller than the holes through which they pass. These connectors are secured, so that only lateral expansion can take place. A recess is moulded in each end of the reflector to receive the end of the adjacent section. Thus some adjustment can be made for lamps of varying lengths. Ten figures.

1,002/13. **Series Lighting.** E. BOOTH and N. R. BOOTH. In a low-pressure incandescent lamp series lighting system each lamp is provided with a substitutional resistance designed as follows:—Normally two conductors are separated by a thin insulating material, such as paper, thinly coated with a conductor, e.g., graphite, and perforated by a sharp-pointed instrument. On failure of the lamp the rise in pressure is sufficient to fuse the conducting coating and partially destroy the insulation, so that a low resistance path is established. One figure.

3,227/13. **Synchronous Polyphase Motors.** CROMPTON & Co. and H. BURGE. Power-factor regulation is obtained in polyphase self-exciting synchronous machines by providing the armature with a main A.C. winding and with a D.C. winding and commutator. The field is compounded by a winding connected to a brush pair so placed (i.e., about 90 electrical degrees from the main brushes) as to collect the current due to the E.M.F. produced by the armature cross-flux. Two figures.

8,352/13. **Electro-deposition.** K. S. GUITERMAN. A series of electrodes are suspended in the electrolyte so that a flow is set up approximately parallel to the electrodes. This is obtained by feeder pipes, and the velocity is such that the slimes are continuously removed from the bath with a portion of the electrolyte. High current densities may be used. Three figures.

12,753/13. **Filament Supports.** WOLFRAM LAMPEN A.G. To prevent fritting or fusing together of the filaments and the supports, the latter have, as nearly as possible, as high a fusing temperature as the filaments. They are made from about 98 per cent. of oxide of tungsten and two per cent. of thorium oxide.

The mixture is reduced in hydrogen and worked in the usual way. A pliant wire results.

14,562/13. **Liquid-heaters.** E. A. RAVES. An element for heating liquids by insertion consists of a resistance wire wound on an insulated metal cylinder, and enclosed in an insulated metal casing. A construction of the leading-in wires and upper part of the element is also given. One figure.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Names in *italics* indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, &c.:** B. T.-H. Co. (*G. E. Co., U.S.A.*) [Motor control systems] 21,263/12; SIEMENS-SCHUCKERT. [Fly-wheel storage for hauling and winding machinery] 11,007/13.

**Dynamos, Motors, and Transformers:** ROLFE [Turbo-generator field-magnets] 14,056/12; FRIEDR. KRUPP [D.C. dynamo connections] 1,407/13; SIEMENS-SCHUCKERT., 14,390/13.

**Electrochemistry:** HOOFNAGLE [Treatment of gases and vapours] 20,950/12; HENDERSON [Ozonisers] 1,156/13; STEYNIS [Ozonisers] 3,769/13; GES. FÜR CHEMISCHE INDUSTRIE IN BASEL [Electrolysis of aqueous solutions] 11,872/13.

**Incandescent Lamps:** SCHALLER, 1,804/13.

**Instruments and Meters:** SIEMENS & HALSKE [Photographically recording readings] 8,240/13.

**Storage Batteries:** DE SEDNEFF, 18,571/12.

**Switchgear, Fuses, and Fittings:** KRAMER [Distribution boxes] 23,750/12; BROOKS and HOLT [Switches for lighting systems on automobiles] 25,420/12; MÖLLER [Automatic circuit breaking] 27,530/12; BOUTARD [Automatic switches] 5,546/13; SIEMENS-SCHUCKERT. [Switches] 16,454/13.

**Telephony and Telegraphy:** SIEMENS & HALSKE [Circuits for automatic telephone systems] 18,498/12; [Registering circuits for automatic telephone exchanges] 9,168/13; [Inductance coils] 12,565/13; MARR [Telephone receivers] 21,664/12.

**Traction:** RISI [Railway signalling] 28,213/12; MANTHORPE and HANSEN [Cab signalling] 10,391/13.

**Miscellaneous:** PARKS [Flexible clip for lamp-shade holders] 20,805/12; GRAEMIGER [Lifting magnets] 24,541/12; FELTERICO [Light diffusing screens] 6,064/13; SCHLOSSBERG [Acid and fire-proof bodies of silicic anhydride] 6,949/13; SULLIVAN [Automatic ships' telegraph alarms] 11,972/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos:** SOC. INTERNATIONALE LUMIÈRE (PROCÉDÉS DUSSAUD) [Picture projector pedal-driven dynamos] 20,288/13.

**Telephony:** SIEMENS & HALSKE [Automatic and semi-automatic systems] 16,538/13; [Circuits] 19,928/13.

**Miscellaneous:** PELLI [Alarms for money safes] 10,087/13.

### Expiring and Expired Patents

The following specifications expire during the current week, after a life of fourteen years:—

20,655 of October 14th, 1899. **Stone-ware Conduits.** THE ALBION CLAY Co. and R. LAWTON. Socket and spigot joints of stone-ware conduits are provided with composition joints so that the conduits may be quickly laid in true alignment. A female mould on a base, which also supports vertical guides for a crosshead carries a movable male mould. In addition a bar or plane is provided. This can be adjusted laterally to bear on the side of the sections where the joints are formed.

20,661 of October 14th, 1899. **Nickel Steel Leading-in Wires for Glass Vessels.** LA SOCIÉTÉ ANONYME DE COMMENTRY-FOURCHAMBAULT. The combination of glasses of different compositions with nickel steels containing approximately 28 to 30 per cent., or about 42 to 46 per cent. of nickel is claimed. The expansion of the glass and nickel-steel is the same.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** W. AITKEN [Pole line insulator for use where the overhead line is cabled] 13,902/04.

**Dynamos, Motors and Transformers:** M. LATOUR [Repulsion-induction motor] 13,585/04.

**Electrochemistry:** D. SINCLAIR [Coloured surfaces are produced on metal by making this the anode in an alkaline lead and copper solution] 10,977/00; [Use of iron, silver, gold, nickel, &c., instead of copper] 13,487/04.

**Instruments and Meters:** G. C. FRICKER [Differential thermometer type maximum demand indicator] 13,663/02.

**Traction:** W. R. SYKES and W. R. SYKES INTERLOCKING SIGNAL Co. [Motor operated semaphore signals] 13,130/08.

ROBUST and  
RELIABLE!

# IGRANIC

## SWITCHGEAR

IGRANIC ELECTRIC CO. LTD.  
LONDON

Works:  
BEDFORD

ditions of the test were as follows: Copper horns, 5/16 in. diam.; temperature, 60° F.; barometer, 30 in.; alternator giving approx. sine wave; frequency, 50 cycles. The air is such a variable factor that it is not possible to set the gap so that the spark voltage will not vary more than 10 per cent. under all conditions. The humidity of the atmosphere may affect the spark voltage to this amount. The spark voltage is increased by about 1 per cent. for a fall of 5.4° F., or for a rise of 0.3 in. in pressure. If discharges have taken place in the neighbourhood of the horns, the dielectric strength of the air is very much reduced. It is, of course, the maximum value of the voltage wave which determines the point of breakdown, so that peaky waves will have lower R.M.S. spark voltages for the same gap.

It is not wise to set the gap too fine, as trouble may arise due to surges caused by changes of current in the circuit. These voltages may reach two or three times normal, but are of short duration. To protect against direct lightning strokes, induced charges caused by lightning in the neighbourhood or static charges due to atmospheric conditions, it is satisfactory to set the gap for three or four times normal pressure. It is customary to provide a resistance in series with the horns to limit the energy current which follows the initial spark to about 2 amps. This does not affect the spark voltage, but if it is omitted, the gap should be made wider to make sure that the energy current will be interrupted.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The International Conference on Safety at Sea is to meet in London on November 12th, and among the resolutions is one by the German delegates to the effect that all passenger steamers carrying seventy-five persons, including the crew, must carry a wireless installation with a range of a 100 sea miles.

A "Report of the Proceedings of the Board of Agriculture and Fisheries in relation to the Complaints of Damage to Submarine Telegraph Cables by Trawlers" has been issued as a Government Paper. This report is in English; the same report was issued in French last month (see ELECTRICAL ENGINEERING of September 18th) as an appendix to the report of the proceedings of the recent International Conference on the same subject. It gives a description of the methods of inspection of steam trawlers, which has been found effective in reducing the damage done to cables.

The Post Office has acquired a site in Great Tower Street, E.C., for a new manual C.B. telephone exchange of 10,000 lines capacity. As the present tenants will not leave before next Lady-day, it will not be until 1916 that the exchange can be working. It will relieve the existing Avenue, London Wall, Central and City, and Bank exchanges.

The new 10,000-line Victoria exchange was opened last week, but so far only new subscribers have been connected. The transfers from the old Victoria will shortly be made. The latter was filled by the transfers from the National Telephone Co.'s Westminster exchange.

In connection with the Strowger automatic telephone exchange at Newport (ELECTRICAL ENGINEERING, June 12th, p. 345), we learn that there is to be a small "satellite" automatic exchange at Chepstow. The erection of the Lorimer automatic exchange at Hereford is now practically complete, and may be taken over by the Post Office in a few weeks' time. The equipment was described in ELECTRICAL ENGINEERING, July 24th, p. 435.

The danger of aeroplanes and airships coming into collision at night with high wireless aerials has led the Telefunken authorities to set up a warning signal on the roof of the Nauhen station. This consists of two 1,000-c.p. metal filament lamps connected with an automatic switch so that they give the Morse signal "N" continuously all night. The signal has been observed from a balloon twenty-five miles distant from Nauhen, and at an altitude of 1,300 ft.

At an extraordinary general meeting of Marconi's Wireless Telegraph Co., Ltd., last week, the scheme for raising

new capital, referred to on p. 562 of our last issue, was sanctioned. Mr. G. Marconi, Chairman of the Company, presided, and a long speech was made by Mr. Godfrey Isaacs, the Managing Director. With regard to the Goldschmidt high-frequency alternator, the patent rights for which the Marconi Co. will now take over, he pointed out that whilst there is great merit in the invention, Professor Goldschmidt did not claim to have invented a system of wireless telegraphy, but only a machine for the generation and utilisation of continuous waves. In the opinion of the Company's advisors, the Goldschmidt station at Hanover was still a very long way from being able to conduct a Transatlantic service without the assistance, experience and patents of the Marconi Co. He did not, however, wish this statement to detract in any way the great merit due to Professor Goldschmidt for his invention. There was, nevertheless, not an atom of foundation for the statements recently made in the Press that the Goldschmidt station at Hanover had succeeded in transmitting a wireless message to Tuckerton, U.S.A., at a regular rate of 100 words per minute for several hours. The directors were convinced that the step taken by the Company in purchasing the Goldschmidt patents would be a very marked advantage to the nation, as, should the Goldschmidt machine prove to be able to do all that was anticipated, the country would have the benefit of it without any extra cost.

The Falmouth-Bilbao cable of the Direct Spanish Telegraph Co. broke on the 3rd inst.—Communication is also down between Singaradja Ampenan, and telegrams for the latter place, Mataram, Selong, Praja, and Labocanhadji are sent by post from Singaradja.—The Oran-Tangier cable went on the sick list on the 6th inst.

**Western Section of the Institution of Electrical Engineers.**—A booklet has been sent out by this section, of which Mr. H. Faraday Proctor is now chairman, giving particulars of the section, extracts from the articles of association of the Institution, a list of members of the section, and the dates provisionally fixed for meetings. The session will commence on October 27th by an afternoon meeting at Bristol, when Mr. H. Faraday Proctor will give his Presidential Address. A visit to the works of W. D. & H. O. Wills will be paid in the morning, and the annual dinner will be held in the evening.

**Municipal v. Company Supply.**—We have received from the Research Department of the Fabian Society a copy of a Paper on "Public versus Private Electricity Supply," by Mr. C. Ashmore Baker. The author analyses, by means of curves, the published results of municipal- and company-owned undertakings with a view to proving the superiority of the former. He shows first of all that the capital cost per kilowatt is lower for municipal than for company stations of corresponding size, and refutes the charge that municipalities make large paper profits by selling current to themselves for public lighting at excessive rates, by showing that the average price charged by municipalities is actually higher for stations under 2,000 kw., and only very slightly lower for larger undertakings. With regard to wages paid, he declares that although their curve shows a lower wages cost per unit sold, municipalities pay on the average a higher rate than companies, but more than make up the difference by judicious management. The fact that companies pay much more for repairs and maintenance he apparently regards as evidence of economy, and he claims that the municipalities maintain their plant in quite as efficient working order. The smaller amount spent on fuel by municipalities he considers unimportant, as a larger percentage of municipal stations are situated in the coal area. The management expenses, &c., are much higher in case of companies, and Mr. Baker exultingly points out that municipalities get a board of directors for nothing. The cost of oil, water, and stores works out at about the same, but in the case of rent, rates, and taxes, no general law can be adduced. The total working costs per unit sold are shown to be much less for municipal undertakings. It is shown that the price obtained is markedly lower in the case of municipalities, but it is argued that, had they charged the same prices, they would have made 2½ times the gross, or 2½ times the net profits per £ of capital that the companies have gained. Another argument advanced against company supply is founded on statistics showing that the units sold per head of population have advanced much slower in company than in municipal undertakings.

**ELECTRIC TRACTION NOTES**

The capital reconstruction scheme of the Sunderland District Electric Tramways which involves the cutting down of the preference shares from £1 to 10s. each, and the cancellation of the arrears of dividend, and the conversion of the dividend from cumulative to non-cumulative, although meeting with considerable opposition on the part of the shareholders, has been passed.

The Greenock & Port Glasgow Tramways Co. has still fourteen years to run before its present lease of the tramways in Greenock expires, but the Council has the opportunity of acquiring the undertaking by agreement in 1914. There is a strong feeling in the town that this opportunity should be taken advantage of, but the Council has not yet dealt with the suggestion.

A proposal at the last meeting of the Glasgow Corporation that consideration should be given to the construction of tube electric railways from east to west, in order to relieve congestion, was carried.

The Croydon Corporation has passed a recommendation by the Tramways Committee that the Government shall be asked to give effect to the report of the Select Committee on motor traffic at the earliest possible moment. The Croydon Corporation has taken an active part in the question of the unfair competition of motor omnibuses with municipal tramways.

The Buenos Aires Lacroze Tramways Co. is making an issue of £500,000 5 per cent. consolidated mortgage debentures at 88.

The Birmingham Tramways Committee is negotiating for the purchase of the Birmingham Omnibus Co.'s undertaking, in order to have all street-travelling facilities under its own control.

The proposal that first-class trams shall be run in Manchester has failed so far as the Tramways Committee is concerned. It is possible, however, that the question will be raised in the Council itself.

The Auckland Electric Tramways Co. proposes to increase its capital by the issue of £100,000 ordinary shares. We refer in our "Tenders Invited" column to new plant required by this Company.

**LOCAL NOTES**

**Aberdeen: Street Lighting.**—Hitherto the whole of the street lighting, including repairs, has been under the control of the Electrical Department, but in future this work will be undertaken by the Lighting Department.

**Barking: Electricity Accounts.**—The electricity accounts for the year to March 31st show a net profit of £1,852 after meeting capital charges, and £3,193 for special expenditure. The Borough Treasurer, in reporting this result to the Council, calls attention to the desirability of adding the net profit to the reserve fund, a recommendation which was adopted by a subsequent meeting of the Council.

**Bristol: Wages in the Electrical Trade.**—The dispute between the Bristol electrical wiremen and the electrical contractors has not yet been settled, and pending a settlement the men remain out on strike.

**Dromore: Public Electric Lighting.**—An electric lighting scheme has been put into operation.

**Dublin: Coal for Electricity Department.**—An attempt to unload a cargo of coal last week for the electricity undertaking was prevented, as the result of the present labour troubles in Dublin. It is understood, however, that this coal is only a portion of the normal supplies now coming in for the winter, and that the stock in hand at Pigeon House Fort is sufficient to carry the undertaking on until January.

**Dundee: Supply to Broughty Ferry.**—It has been decided when laying a cable from Carolina Port power house to Broughty Ferry, to construct a second duct in order to avoid the opening of roads a second time later on.

**Edinburgh: Electricity Accounts.**—There was a net profit of £2,169 upon the working of the electricity undertaking last

year. The Committee has asked the Town Council to reduce the charges for private lighting by one-eighth of a penny per unit. The present rate is 2½d. per unit.

**Glasgow: The Electrical Exhibition.**—The Countess of Glasgow will open the Electrical Exhibition which is being promoted by the Corporation Electricity Department on October 23rd. The Exhibition will remain open to November 15th, and in addition to lectures on the applications of electricity to various purposes, there will be demonstrations of cooking and heating by electricity.

**Great Harwood: Electric Supply.**—The Accrington Corporation has been asked upon what terms they will take over the Council's provisional order.

**London: Poplar: Electricity Accounts.**—There was a net profit of £3,170 upon the working of the electricity undertaking for the year to March 31st. After meeting a number of items, including services and meters, wiring installations and cooking installations, the net balance carried forward is £2,691. Attention is called in the report to the fact that an agreement has been entered into between the Poplar and Stepney Councils which will obviate the necessity of further extensions until the maximum demand on the Poplar undertaking has reached 10,000 kw. Satisfactory progress has been made during the year in converting the old type arc lamps to the modern system of street lighting, viz., by high candle power incandescent lamps; in addition, seventy-two gas lamps have been converted to electric lighting.

**Marylebone: Electricity Accounts.**—The accounts of the electrical undertaking for the June quarter show the most satisfactory quarterly report for many years past. The increase in the number of units sold to private consumers is no less than 30 per cent. above that of the corresponding quarter of 1912, and thus 30 per cent. more electrical energy has been produced for an extra expenditure of only 3·14 per cent. In other words, to secure an addition to the income of £4,160, an expense of only £465 has been incurred. The net cost of the Sales and Publicity Department for the quarter was £491, and Mr. Seabrook thinks it must be left to the judgment of individual members of the Council as to what extent the improvement in the general electricity revenue is attributable to the work of this Department.

**Middleton: The Electric Power Co.**—With reference to the note on p. 519 of our issue for September 11th, the Electricity Committee has rescinded the resolution giving consent to the Lancashire Electric Power to supply the Calico Printers Association, as arrangements have been made with a neighbouring corporation for a bulk supply which will enable the Corporation to deal with the business itself.

**Port Glasgow: Electric Supply.**—The arrangements with the Greenock Corporation for a supply of electrical energy include a 42 years' concession, whilst a number of agreements have been fixed up with large power users for periods of twenty years.

**Stoke-on-Trent: Tests of the High-Tension Plant.**—At the last meeting of the Electricity Committee the Electrical Engineer reported that the tests of the Siemens motor-generators in the new power station did not comply with the guaranteed performance. During the course of the discussion with Messrs. Siemens' representatives, it was admitted by them that there had been difficulty in designing 100-cycle single-phase plant, and that the permeability of the magnetic core was lower than had been anticipated. The firm, however, offered to provide boosters for the generators, or to rewind the generators and to provide new pole pieces. The Committee have adopted the Engineer's recommendation to accept the boosters to enable the load to be dealt with during the forthcoming winter, and that subsequently the stators should be rewound and new pole pieces fitted.

**York: Street Lighting.**—In consequence of the York Gas Co. having made a reduction in their charges for street lighting, the Electricity Committee have been asked to make a reduction in their charge for street lighting by electricity.

**Death by Electric Shock.**—An inquest was held last week concerning the death of George Carpenter, an electrician at Messrs. Edward Lloyd's Paper Mills, Sittingbourne, who was killed at the works whilst engaged in fitting up some cable. It appears that whilst adjusting the cable he touched a live wire on the transformer, and received a shock from a 430 volt transformer. During the evidence it was stated that the deceased was not wearing rubber gloves as he ought to have been, and H.M. Inspector of Factories for the district, who attended the inquiry, said that the firm had provided every possible safeguard for the lives of the men.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Ardley.**—The Surveyor has been instructed to obtain information as to a possible electric lighting scheme.

**Australia.**—An electrically-driven pumping installation is required for Canberra. Secretary, Department of Home Affairs, Russell Street, Melbourne. Further particulars, 73 Basinghall Street, London, E.C.—Supply of insulated lead-covered cable is required by the Melbourne Electric Supply Committee. Messrs. McIlwraith, McEacharn & Co., Billiter Square Buildings, London, E.C.

**Bootle.**—Mains extensions to supply Messrs. Harland and Wolff's works are to be carried out at an estimated cost of £300.

**Burnley.**—The details of the Council's application to borrow £36,227 are as follows:—A 2,000-kw. turbo-alternator, condensing plant, &c., £7,420; two 500-kw. rotary converters and transformers, £9,040; new switchgear and alterations, £2,400; two boilers, £1,300; economisers, £700; water softener, £500; cooling tower, £600; engine-room cranes, £600; sub-stations and equipment £4,100; cables, £3,700; mains and services, £7,000; contingencies, £2,657.

**Criccieth.**—A special committee has been appointed to consider the question of electric lighting.

**Ellon.**—Messrs. T. C. Smith & Co., who have been negotiating with the Council with regard to an electric lighting undertaking, have now offered better terms, and a meeting has been arranged between the Manager of Messrs. Smith and the Council.

**London: Battersea.**—Mains extensions, &c., are to be carried out at an estimated cost of about £378.

**New Zealand.**—A 1,000-kw. generating set is to be installed by the Auckland Electric Tramways Co.

**Shanghai.**—E.H.T. pilot cable, &c. Consulting engineers, Messrs. Preece, Cardew & Snell, 8 Queen Anne's Gate, S.W. October 17th.

**South Africa.**—Extensions to the electric lighting undertaking at Pretoria are contemplated at an estimated cost of £25,000.—According to the *British and South African Gazette*, electric lighting schemes are to be undertaken at Ermelo and Kampala. Considerable extensions to the electricity undertaking at Durban are also contemplated.

### Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

**Blackburn.**—New fire station.

**Cardiff.**—Extension of head Post Office. H.M. Office of Works, London.

**Chorley.**—New school. Town Clerk.

**Coventry.**—New technical institute (£30,000).

**Edinburgh.**—Military quarters at cavalry barracks, Redford. Director of Army Contracts, War Office, London.

**Failsforth.**—Public Gardens.

**Grantham.**—Elementary school.

**Hinckley.**—New elementary school.

**Kettering.**—The Kettering & District hospital is to be wired for electric lighting. The specification is being prepared by the Borough Electrical Engineer.

**London.**—New infirmary at Tulse Hill for Lambeth Guardians. (£200,000).

**Mountain Ash.**—New fire station.

**Royton.**—The Town Hall, market, baths and free library are to be wired at once. The Council has just made an application for an electric lighting provisional order.

**York.**—Guardians board room and offices, Museum Street.

### Miscellaneous

**Australia.**—Automatic switchboards with accessories for suburban telephone exchanges are required by the Deputy

FOR  
STEAM JOINTS  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

Postmaster-General, Sydney. March 18th, 1914. Further particulars, 73, Basinghall Street, E.C.

**Bradford.**—Twelve months' supply of electrical sundries for Tramways Department. Town Clerk. October 18th.

**Glasgow.**—A twelve months' supply of electric lamps and fittings for the Lunacy District Board, 266 George Street.

**Leicester.**—Tramway extensions estimated to cost £30,000 are recommended. Ten additional P.A.Y.E. cars are to be ordered.

**Newcastle-on-Tyne.**—Twelve tramcar bodies with covered tops, electrical equipment and trucks. General Manager.

**Newport (Mon.).**—A scheme for considerable extensions of the tramways to the suburban districts is under consideration.

**New Zealand.**—Two sets of high-lift electrically-driven turbo pumps. Town Clerk, Hastings, New Zealand. December 18th. Further particulars, 73 Basinghall Street, E.C.

The Dunedin Council requires a two years' supply of meters, maximum demand indicators and cable.

### TENDERS RECEIVED AND ACCEPTED

**Blackpool.**—An order for a 1,000-kw. turbo-generator and condensing plant has been placed with Messrs. Richardsons, Westgarth & Co.

**Cardiff.**—The following tenders have been accepted:—Turbo-generator for the Roath power station, Fraser & Chalmers, £6,345; 1,000-kw. rotary-converter for the Hayes sub-station, the British Westinghouse Co., £1,955.

**Clonakilty.**—The tender of the local electric light and power company for fifty 50-c.p. lamps for street lighting purposes at an annual cost of £100 for a period of 15 years has been accepted.

**London: Hackney.**—An offer by Messrs. Cox-Walkers, Ltd., to instal a Taylor-Scotson pressure regulator at £200 is recommended for acceptance. The makers are willing to give a twelvemonths' guarantee, and remove it at the end of that period if it is not satisfactory to the engineer.

**Manchester.**—Orders have been placed with W. T. Glover & Co., Johnson & Phillips, and the Western Electric Co. for L.T. paper-insulated cable.

**Salford.**—The British Westinghouse Co. has received an order for additions to the E.H.T. switchboard at £275.

**Wimbledon.**—A tender at £9,900 for a new turbo-alternator with accessories has been accepted, subject to the Local Government Board's sanction to the necessary loan.

### APPOINTMENTS AND PERSONAL NOTES

Mr. G. Cardwell, Manager of the Devenport & District Tramways Co., has been presented with a silver tea and coffee urn by the employees on the occasion of his marriage.

We are pleased to hear that Mr. G. F. Naylor, Chief Electrical Engineer to the Nelson Corporation, is now improving from a serious attack of pneumonia.

The following increases of salaries are recommended in the Brighton Electricity Department:—F. C. N. Bergh, Assistant Mains Superintendent, from £2 17s. 6d. per week to £165 per annum; H. Chipp, foreman-jointer, from £2 5s. to £2 7s. 6d. per week; W. Charman, testing inspector, from £2 5s. to £2 7s. 6d. per week; H. Heasman, foreman motor adjuster, from £1 19s. to £2 2s. per week; G. Packham, foreman wireman at Southwick, from £2 2s. 6d. to £2 5s. per week.

Mr. J. Bemrose, Chief Assistant Electrical Engineer at Tunbridge Wells, has been appointed Chief Electrical Engineer to the Leek U.D.C. in succession to Mr. R. M. Carr, who has gone to Macclesfield.

The recommendation to increase the salary of Mr. H. D. Munro, the Exeter City Electrical Engineer, referred to in our last issue, has been deferred until next January by a vote of the Council.

Mr. A. Clough, late Resident Electrical Engineer, and more recently Consulting Electrical Engineer to the Liverpool Corporation, from which position he has now resigned, has been presented with an illuminated address and two divan chairs by the staff.

Mr. R. M. Carr, who recently resigned the position of Electrical Engineer to the Leek U.D.C., has secured a similar position with the Macclesfield Corporation.

Mr. Alfred Hands informs us that he has accepted engage-

ments to lecture on lightning protection at a number of places in London and the Provinces.

Mr. W. Wyld, late Borough Electrical Engineer, Birkenhead, was entertained by a number of friends to dinner on Friday last to celebrate his appointment as Borough Electrical Engineer at Hampstead. Mr. H. E. Blain was in the chair, and Mr. E. P. Barfield acted as Hon. Secretary in making the arrangements.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £77 5s. to £77 15s. (Last week, £77 to £77 10s.)

**Change of Address.**—Bi-metals, Ltd., have removed from 80A Southwark Street, S.E., to 57 Lant Street, Southwark, S.E.

**Small Metal Filament Lamps.**—The British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), advise us that they have now introduced a 10-watt Mazda drawn wire lamp for 100–130 volt circuits, giving 8 c.p., which should prove very useful in small rooms where 8 c.p. carbon lamps are sometimes still retained.

**Agency.**—H. W. Butler & Co. inform us that they have been appointed sole agents in this country for the Ateliers de Constructions Electrique du Nord et de l'Est, of Jeumont, France, manufacturers of electric plant and cables.

### COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Dick, Kerr & Co.**—The trading profit for the year ended June 30th amounted to £30,100, compared with £3,300 in the previous year, and after deducting debenture interest there was a net profit of £18,600, compared with a loss in the previous year of £8,600. No dividend, however, is recommended on the ordinary shares.

**Callender's Cable & Construction Co.**—An interim dividend at the rate of 10 per cent. per annum, less tax, has been declared on the ordinary shares.

**Drake & Gorham.**—There was a net profit of £10,268 for the year ended June 30th, and after paying a 5 per cent. dividend, and writing off the balance of underwriting commission, the sum of £1,716 is carried forward. The report states that the steady increase in the turnover has been maintained, and that encouraging reports continue to be received concerning the efficiency of the firm's lighting system, the details of which are constantly being perfected.

**Edison Accumulators.**—A prospectus is being circulated privately, in which £50,000 participating preference shares are offered at par.

**Hove Electric Lighting Co.**—A dividend at the rate of 8 per cent. has been declared for the six months to June 30th.

**Consolidated Diesel Engine Manufacturers.**—The first annual meeting was held on Wednesday last week, when, as we mentioned in our last issue, the mysterious disappearance of Dr. Diesel was announced. Among those present was Mr. Georges Carels, of Carels Frères, Ghent, and it was stated that the site of the Ipswich works occupies twenty-three acres, the Company having the option of twenty-three acres adjoining. This option has been exercised. The total amount of money spent on the works, including land, to date is £140,000, but in spite of various difficulties, including strikes, a fair number of orders have been booked. At present, however, there was no question of dividends being paid by the English Company, as the works were not yet finished. Some dissatisfaction was expressed by the shareholders at the meeting that no accounts had been prepared, and eventually the meeting was adjourned to a date not later than December 31st.

**Cleveland & Durham Electric Power.**—An issue of £130,000 5 per cent. first mortgage debentures is being offered at £97 10s.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

## SUMMARY

AN application made by Evershed & Vignoles to restrain R. W. Paul from using the name "Omega" for his testing set was decided yesterday in favour of Mr. Paul. The patent action by the Marconi Co. against the Helsby Wireless Telegraph Co. is expected to come on for hearing early in the Michaelmas Law Sittings. (Page 578.)

A good collection of wireless apparatus is shown at the "Model Engineer" Exhibition, now being held at the Horticultural Hall. (Page 578.)

THE hydroelectric power-station which has been established by the Chester Corporation on the site of the old Dee Mills, will be formally inaugurated on Saturday. The equipment consists of four vertical shaft, low fall turbines, driving continuous-current dynamos, and in view of the variation in the height of the tail water in the tidal river, the sets are designed so as to be capable of giving their voltage over a considerable range of variation of head and speed. (Page 579.)

AT the "Ideal Home" Exhibition there may be seen some new designs of radiators, ovens, and vacuum cleaners. The lighting effects are very good. (Page 581.)

THE specifications published by the Patent Office last Thursday include one for time-limit circuit-breakers by E. O. Möller, of the British Westinghouse Co., one

for a heat control switch of the diaphragm type by H. C. E. Boutard, and one by Siemens-Schuckert covering a method of damping out the flux pulsations in interpoles. (Page 582.)

THE electrical driving of planing machines is dealt with in our Questions and Answers columns. (Page 583.)

NEW Engineering Laboratories have been opened at University College, Dundee. (Page 584.)

ILLUSTRATIONS are given of recent examples of residence lighting and electric signs. (Pages 584 and 585.)

A DESCRIPTION is given in our Electric Traction Notes of the new split phase system of electric traction which is being experimented with in America. (Page 585.)

SOME particulars are given under "Telephony and Telegraphy," of two submarine telegraph cables recently laid by the Italian Government. (Page 585.)

OPPOSITION is being offered at Halifax by the members of the Gas Committee to a proposal to reduce the charge for electricity.—The proposal to sell the Redditch electricity undertaking has again been brought forward.—Rearrangements of tariffs are being made at Derby and Edinburgh.—The Scarborough Corporation proposes to purchase the local electric supply company.—Special reports from outside engineers are to be obtained upon the Stirling electricity and tramway undertakings. (Page 587.)

It is proposed to duplicate the gas plant in the Accrington electricity works.—Local Government Board inquiries have been held at Wolverhampton (£22,000); Walsall (£4,840); and Loughborough (£14,000).—Extensions are contemplated at Nottingham (£35,000); Stretford (£7,000); and electric lighting schemes are under consideration at Waterford (£27,338), and other places.—Batteries are required at Manchester and Sale, and miscellaneous electrical apparatus by the Victorian Railway Commissioners and the Great Northern Railway Co. of Ireland. (Page 587.)

A NEW issue of capital is being made by the Newcastle-on-Tyne Electric Supply Co. (Page 588.)

**The British Electrical and Allied Manufacturers' Association.**—The annual dinner of this association is fixed for January 14th, 1914. Lord Ampthill is to preside.

**Fire at an Electrical Manufacturers' Works.**—About ten o'clock on Thursday night, a serious fire occurred in a saw mill at the premises of L. Bill & Co., Ltd., electrical accessories manufacturers, Queen's Road, Aston, Birmingham. The origin of the fire is unknown.

**The late Dr. Diesel.**—The body of Dr. Diesel has been found in the Scheldt. According to *The Times* Munich correspondent, a meeting of the creditors of Dr. Diesel has been held when it was stated that there is a deficit in his estate of £25,000 on account of ordinary debts, and £50,000 on mortgages. The creditors have decided to avoid bankruptcy proceedings and to liquidate the assets gradually, for which purpose a committee of five has been formed.

## ARRANGEMENTS FOR THE WEEK

FRIDAY, OCTOBER 17TH.

*Electro-Harmonic Society.*

8 p.m. Smoking Concert at Holborn Restaurant.

SATURDAY, OCTOBER 18TH.

*Birmingham and District Electric Club.*

7 p.m. Lecture on "Electric Cooking," by W. E. Milns.

MONDAY, OCTOBER 20TH.

*Institution of Electrical Engineers: Newcastle Section.*

7.30 p.m. Inaugural Address by Chairman at Armstrong College, Newcastle.

WEDNESDAY, OCTOBER 22ND.

*The 25 Club.*

7.15 for 7.30 p.m. Dinner at Connaught Rooms, Great Queen Street, Kingsway, W.C.

THURSDAY, OCTOBER 23RD.

*Institution of Electrical Engineers: Newcastle Section.*

7 p.m. Meeting of Tees-Side Members at the Literary and Philosophical Society, Middlesbrough, when Chairman's Address will be repeated.

*Institution of Civil Engineers.*

9 p.m. "James Forrest" lecture by Alexander Grant, on "Progress of Marine Construction."

## PENDING ELECTRICAL LAWSUITS

**D**URING the Michaelmas Law Sittings, which began on Monday last, a number of cases of considerable electrical interest will probably come on for hearing. Of greatest interest, perhaps, is the action brought by the Marconi Co., Ltd., against the Helsby Wireless Telegraph Co., Ltd., to restrain alleged infringement of the famous Marconi patent No. 7,777 of 1900. The trial of this action has long been expected, but it was only a few months ago that the Marconi Co. obtained permission to interrogate the Helsby Co. as to any differences recently made in the system employed by them (*ELECTRICAL ENGINEERING*, July 17th, p. 425). The case will be heard by Mr. Justice Eve in a few weeks' time.

A case to be tried some time hence by Mr. Justice Neville will turn on two patent specifications. The action is brought by the Anglo-Swedish Electric Welding Co. against the British Arc Welding Co. Mr. Justice Neville will also be required to determine the construction to be placed on a detail in an agreement between Mr. Lemmens, who is on the board of Everett, Edgecumbe & Co., Ltd., and the Company.

In the Divisional Courts two actions are down for consideration. In one of these the question of a reduced assessment of the L.C.C. tramways in Islington will be discussed, the County Council's claim being based upon the lower profits due to motor-bus competition. In the other action, some outstanding question regarding the purchase of the London United Tramway Co.'s undertaking in London by the London County Council has to be disposed of.

There are also several minor actions in which electrical interests are involved, but the cases are not of an electrical engineering nature.

**The "Omega" is not the "Megger."**—In an application before Mr. Justice Neville yesterday by Evershed & Vignoles, Ltd., against R. W. Paul, for an injunction to restrain the sale of portable testing sets under the name "Omega," it was admitted that the name had been used to some extent for a number of years as a trade mark on electrical measuring instruments. The application was, as a result, dismissed with costs, with some reservations. The action was brought on the ground of infringement of trade mark, and that the use of the word "Omega" in connection with the testing sets was a "colourable imitation calculated to deceive." Mr. E. B. Vignoles stated in the course of his evidence that the sale of "Meggers" was from 1,200 to 1,500 a year, and still increasing. In cross-examination it was shown that the term Omega was used for some measuring instruments at least as far back as 1903, and a voltmeter sold by Isenthal & Co. bearing the sign  $\Omega$  was produced. A question as to whether this line of evidence was disclosed in the pleadings was raised, and Mr. Justice Neville offered to allow time for the pleadings to be amended. After consultation, however, Mr. A. J. Walter, K.C., who appeared for Evershed & Vignoles, asked for the action to be dismissed without costs. Mr. H. A. Colefax, K.C., who appeared for Mr. R. W. Paul, however, asked for costs, and these were allowed with the exception of the costs of witnesses intended to be called to speak to the general use of the term Omega in the electrical trade.

## THE "MODEL ENGINEER" EXHIBITION

**A**T the Model Engineer and Scientific Exhibition, now being held at the Horticultural Hall, there is a good display of wireless telegraph apparatus with different degrees of finish and reliability. Some examples of well-finished apparatus may be seen at the stand of the Static Scientific Co. (237-239 Katherine Road, East Ham). In particular may be mentioned a patented adjustable condenser, in which the moving plates are completely encased in a moulded di-electric. There are also high-pressure condensers made for a wide range, flat pattern oscillation transformers, crystal and electrolytic detectors, and the other accessories incidental to wireless work. The Company manufactures receiving and transmitting sets for different purposes, while time-signal receiving sets, motor-generators, switchboards, &c., are supplied. Here also one can see the Gibson patent insulated terminal, which was illustrated and described in *ELECTRICAL ENGINEERING*, September 25th, p. 546.

A large range of wireless apparatus to meet almost every experimenter's requirements is shown by A. W. Gamage & Co., Ltd. In addition to its stand in the body of the hall, this Company has erected an aerial in connection with receiving apparatus in the wireless telegraph section. This section is in a separate room up the stairs, where also may be found the exhibits of the British School of Telegraphy, Ltd. Some actual transmitting and receiving apparatus for land and submarine lines, as well as wireless, is shown working, and the methods adopted by the Company for training operators may be learned. Allied to this company also is the British Telegraph Instrument Co., Ltd., which has a large stand on the ground floor, where much apparatus for use by the Marconi Co. and different Governments may be seen. Of particular interest perhaps is a set designed for meteorological purposes, by which a station can be rapidly picked up, and then, by substituting a crystal detector, rapidly and accurately tuned. A crystal detector with a large crystal eccentrically mounted is also shown. This is of robust construction, and can be readily adjusted so that maximum sensitiveness can be obtained. Among the other exhibits is a "Horphone," and some electrical clocks, bell controllers, and an automatic time-ball, shown by the Synchronome Co., Ltd. Some other firms are exhibiting model apparatus and electrical novelties, while some amateur work is on view. Small lathes and tools are also well represented.

**Lightning Arresters.** In the August and September issues of the *General Electric Review* Mr. E. E. Freighton discusses the features of American and European practice with lightning arresters, with the object of showing that the aluminium arrester meets every case. He finds that simple horn gaps are often used in Europe, as they give a large discharge rate, but that they give poor protection on account of the large gap setting. In addition a short circuit of the power is produced at every simultaneous operation of two or more gaps, synchronous apparatus is caused to drop out of step, and a complete interruption of power on the circuit to which they are connected results. In American practice the aluminium arrester is largely used. This gives a discharge rate high enough to take direct lightning strokes, but not so high as the horn arrester, and without the drawbacks of the latter, and, as the gap length is less, greater protection is afforded. The author considers that delta connected horn gaps with large settings without series resistance are unnecessary. Y-connected horn gaps with moderate settings and with enough series resistance to limit the dynamic current to a range of 3 to 12 amperes, is the most recommended practice; but on high pressures too much power is taken from the circuit. At and above 2,300 volts the multi-gap arrester is cheaper, and takes less energy from the circuit. Although the resistance horn gap arrester for medium pressures is largely used, because no other suitable inexpensive arrester is available, a new type of high protective value, it is said, will be put on the market shortly. This, it appears, will be of the aluminium type. The current-limiting action of the aluminium films enables small discharges to pass through a small gap setting and resistance, and performs the same gap functions in one-half cycle, whereas the horn gap takes 50-120 times as long to extinguish the arc. The practice of using multiple horn gaps connected between a number of series choke coils in the line has been discontinued in America, as the aluminium arrester can be set very close to the line pressure. These also make water jet arresters obsolete. The use of electrostatic condensers for shunting high frequency currents with a frequency less than 25 per cent. above normal are not now used in America, where "high-frequency absorbers" have taken their place. In a recent issue of the *Electrical World* (New York), concrete resistors, for use with horn-gap arresters on 11,000- and 22,000-volt lines in Georgia, are described. Two bronze-mesh electrodes are cast into a solid concrete block, 4 ft. long and 1 ft. square. The block is fixed upright on the ground, and the lower electrode earthed, while the upper one is connected to one limb of a double horn-gap arrester. The apparatus to be protected is connected to the other horn and through a fuse to the middle of the gap.

## THE CHESTER HYDRO-ELECTRIC POWER SCHEME

THERE are not many municipal electric supply schemes employing water power in England, and the power station which has been installed by the Chester Corporation on the site of the old Dee Mills, is unique on account of the special arrangements which have had to be made to deal with the variation in the available head of water entailed by the rise and fall of the tide in the estuary. The station will be formally inaugurated on Saturday, when the Mayor of Chester, Councillor H. P. Dutton, will entertain a number of visitors to lunch at the Town Hall.

It is unnecessary to record here in detail the whole history of the "Dee Mills," and the uses to which the available water

and to pull down the mills to the level of the Dee Bridge and Skinner's Lane, and it was then thought that the usefulness of the water at the weir for power purposes had come to an end. Mr. S. E. Britton, City Electrical Engineer, however, brought forward a scheme to convert the water power, which had been usefully employed for nine centuries, into electrical energy. The Electricity Committee, after obtaining a favourable report from Mr. A. C. Hurtzig, consented to the scheme, and after

FIG. 1.—VIEW OF POWER HOUSE FROM EAST SIDE OF OLD DEE BRIDGE.

power at the site now occupied by the electric power station were put in the past, but it is interesting to note that the original and still existing stone dam was constructed by one Hugh Lupus, Earl of Chester, somewhere about the year 1100, partly for working flour mills by water power, and partly for the purposes of a salmon fishery. In subsequent times (from 1600 to 1857) the water power was used for pumping the town water supply as well as for flour mills, which latter industry was continued

FIG. 3.—SECTIONAL ELEVATION, SHOWING LARGE TURBINE, SLUICE GATES, AND STRAINER RACK.

some considerable opposition the scheme was carried through and adopted by the Council. In view of this opposition, which was mainly based on the effect of the works on the interest of other users of the river, it should be pointed out that the Electricity Committee undertook that in the working of the installation, the water from the river above the weir should not be lowered by more than six inches below the mean height of the weir.

FIG. 2.—SECTIONAL ELEVATION OF POWER HOUSE, SHOWING TURBINES AND DYNAMOS.

down to 1908, when, after the last of a series of disastrous fires, the mills were finally abandoned for this purpose. The Corporation had acquired the property in 1895, and established a sewage pumping plant, which, however, was discarded in January, 1910. It was then proposed to sell the machinery

There were no mean engineering difficulties to be overcome in the reconstruction of the retaining walls, and the restoration of the bridge, which were made the more difficult by the flooded condition of the river and

abnormal high tides. Owing to the river being tidal it was necessary to adopt specially designed turbines and dynamos, capable of working efficiently over a wide range of speed, but the result has been an overall efficiency at all times, higher than usually obtained with constant speed plant. It is calculated that the average flow varies from 30,000 cu. ft. per min. in December,

FIG. 4.—VIEW OF INTERIOR OF POWER HOUSE, SHOWING SMALLER GENERATOR IN FOREGROUND.

down to 20,000 in the summer months, with a minimum dry weather flow of 10,000 cu. ft. per min. The average head with neap tides varies from 4.5 ft. in the winter to 8.75 ft. in the summer, but at spring tides the weir is entirely submerged for an hour or two at the turn of the tide, and the turbines are drowned. The weir is placed diagonally across the river at the east side of the old Dee bridge. The water passes to the power-house and enters the turbine pits through a strainer rack and sluice gates, and passes out directly into the lower river. A view of the exterior of the power-house is given in Fig. 1. The general arrangement of the turbines, with their vertical shafts driving the dynamos through bevel gearing, is shown in Figs. 2 and 3.

The power house is 89 ft. long by 24 ft. 6 in. wide, and measured from the bottom of the head-race 36 ft. high. It is mainly constructed of steel and concrete; the exterior is faced with sandstone rock, and the interior with glazed brick. The foundation is on sandstone rock. The under-water work forming the head-race, the three turbine pits, and the tail-race are of concrete and steel. On the external face of the

FIG. 5.—VIEW SHOWING FLEXIBLE COUPLING AND GEARING, WITH ONE OF THE LARGER GENERATORS AND THE SWITCH-BOARD IN THE BACKGROUND.

down-stream side of the turbine pits are placed three cut waters and Gothic arches, harmonising with the adjoining bridge. The external of the above-water part of the building, including the dynamo and switch-room and stores, is in sandstone, and contains twelve pairs of Gothic windows, and the interior is lined with glazed brick. The building is covered with a flat reinforced concrete roof covered with asphalt. There are three circular glass domes in the roof. The retaining wall between the bridge and the power house and 121 ft. of river

wall have been rebuilt, and that part of the old bridge which stands in the head-race and formed part of the old mills has been restored.

There are three vertical-shaft Francis type turbines which were supplied by J. Gordon & Co., designed for working under a head of water varying from 1 to 9 ft., two of which are designed for dealing with 30,000 c.f.m. under an actual working head of 9 ft., and capable of developing 415 B.H.P. at a speed of 50 r.p.m.; the other is designed for dealing with 22,000 c.f.m. under similar conditions, and capable of developing 305 B.H.P. at 55 r.p.m.

The turbine runners are constructed with buckets of forged steel plate cast into a centre boss and surrounding ring of iron, and are keyed to the shafts. The guide casing is of cast-iron, and the guide blades are of cast-iron bushed with gunmetal, and mounted on steel spindles. Each vane is fitted with a link which connects on to a regulating ring, which is operated by two vertical regulating shafts connected by levers and connecting rods to another shaft extending above the floor level and there connected to the hand regulating gear. Each turbine is provided with a set of hand operating gate gear mounted on the generator floor. The revolving weight is supported by a collar suspension bearing, fitted at the upper end of the vertical shaft on the generator floor, and supported by a heavy cast-iron bridgetree. The thrust rings of the suspension bearing are submerged in oil.

The power is transmitted from the vertical to the horizontal shaft by a pair of Citroen machine-cut helical bevel gears, the gears for both the large and small turbines are of cast steel, and the pinions of forged steel, having a ratio in speed of 1 to 5 in each case. These gears are clearly shown with their covers removed in Figs. 4 and 5, together with the flexible

FIG. 6.—CURVES OF OUTPUTS, &C., OF LARGER SET, AT VARIOUS HEADS.

couplings through which the dynamos are driven. Each turbine is provided with recording head and speed gauges.

One complete strainer rack of flat wrought-iron bars is provided across the full width of the head race. There are three complete sets of sluice gates, each set consisting of two pitch-pine gates of the double lifting type; the gates are 11 ft. 6 in. high from the bottom of the head race channel to the top when closed; the lower gates are provided with channel section lifting bars with cast steel racks, and the upper gates are provided with lifting angle plates, which enable the lower gates to lift and carry upwards the upper leaf of the gates. Each sluice gate is provided with a double set of head gear, the worm wheels of which engage on to a shaft fitted with two worms and a bevel wheel, so arranged that each sluice gate under full head pressure is operated inside the power house by one man. The contractors for the building, strainer rack, sluice gates, turbines, gears, horizontal shafts, flexibles, couplings, and travelling crane were J. Gordon & Co. (81 Knightrider Street, E.C.).

The generators are of the shunt-wound interpolar type, manufactured by the Lancashire Dynamo & Motor Co. (Tramford Park, Manchester). Each is mounted on a bed with two pedestal bearings, and coupled to its turbine by means of a flexible coupling. The two large generators each have an output of 225 kw. 440–500 volts, at a speed varying between 143 and 285 r.p.m., while the output of the smaller generator is 185 kw. 440–500 r.p.m. at any speed between 167 and 300 r.p.m. Although the normal maximum speed of either machine is approximately 300 r.p.m., the armatures are banded with steel wire so that they may be safely run at 500 r.p.m. without fear of damage. The higher speed is given when the load is instantaneously thrown off the turbine, as, for instance, in the event of the generator circuit-breaker operating. Special attention has been paid to the insulation

throughout the machines, so that it may withstand the action of the damp atmosphere. In order to obtain specially cool field coils, these are wound in sections with air-spaces between them. A special pattern of box-type brush gear is employed. The curves in Fig. 5 show the way in which the output and speed of the large machine varies with the head of water at different gate openings. The speeds to which the machines would rise on sudden removal of the load are about 70 per cent. in excess of the values given.

The generators are controlled from a switchboard manufactured by Crompton & Co. (Arc Works, Chelmsford), and erected at one end of the power house. It consists of three enamelled slate panels, on which is mounted the usual apparatus for the control of direct-current generating plant. The current generated is conveyed by three lead-sheathed and steel-armoured cables laid direct in the ground to a sub-station at the Cross. As much of the current as is required to meet the demand of that area is distributed from the sub-station; the balance is sent to the steam generating works at New Crane Street, where it passes through a reversible booster, and is either sent out to other areas of supply or stored in a battery in readiness for the next peak load. This booster set was also supplied by the Lancashire Dynamo & Motor Co. It is of the three-wire type, and consists of a motor mounted between two boosters on one cast-iron bed. All machines are of the open type shunt-wound interpolar. The motor is suitable for running from 420-475 volts, and each booster is capable of developing 40 volts continuously with 700 amps. at a speed of 750 r.p.m. The boosters are of the hand reversible type, each field being governed by a reversing potentiometer shunt regulator and excited from 210-237 volts.

The arrangement of the plant provides flexibility and economical running under the varying conditions of flow and head, as one will deal with the dry weather flow, two with the average flow, and three at the times of wet weather flow and low heads. It is estimated that the installation will yield about 1,250,000 units per annum at a cost, including capital charges, of rather less than 0.3d. per unit.

In conclusion we wish to express our thanks to Mr. S. E. Britton, City Electrical Engineer, for putting at our disposal particulars of the plant, together with the drawings and photographs from which our illustrations have been prepared.

## THE "IDEAL HOME" EXHIBITION

NOW that the "Ideal Home" Exhibition is open, we can say that it is very much as we thought it would be, and the applications of electricity shown are proving to be great attractions for the multitude. This is, of course, highly desirable. However, after all the publicity which has been given to "La Maison Electrique," promoted by the Electricity Supply Publicity Committee, the reality is a little disappointing. In the first place, its position in the hall renders it so inconspicuous as to be difficult to find, and the space occupied is none too large. Again, the exhibit has not the appearance of a "house," but looks rather like a collection of stands, which are viewed as well from the outside as inside. A considerable amount of representative heating, cooking, lighting, and other domestic and office apparatus, however, has been brought together, but it is too cramped up to be effective. The wonderful dining-table is not at all impressive, and there is nothing to convince the spectator that it is not worked by hand; and as a finale to the visitor's tour through the stand leaves him confused as to which are the real benefits that electricity can afford in his home.

A few stands away, however, is the exhibit of Rashleigh Phipps & Co., where there is a room fitted with different types of lighting by metal filament lamps—cornice, indirect from suspended bowls, semi-indirect, &c. The control is from a number of switches, on which is marked the power taken by the lamps controlled by each, so that the results from the different systems under the same conditions may be visually compared. There also one may see handsome designs of Prometheus, Belling, and G.E.C. radiators, and, as we mentioned last week, there are irons, lamps, and cooking apparatus on view. The new G.E.C. grill and oven, with polished case and air-space between the outer and inner walls, are being used for cooking operations, while electric ironing and sewing are also carried out. Small ozonisers, table fountains, electric clocks, and other novelties, as well as the more utilitarian apparatus, are also displayed.

Adjoining this stand is that of the Dowsing Radiant Heat

Co.; Ltd. Here, in addition to the apparatus mentioned in ELECTRICAL ENGINEERING last week, is a new radiator with a single 750-watt red-hot element of the most recent quartz-protected type. This is sold at 36s., and should prove very useful for knee-hole desks and other restricted spaces. An air-lagged oven is now on view. This has been experimented with for a considerable time, and a similar one is used for cooking the daily lunch for the staff at the Company's show-rooms at 105 Great Portland Street, W. It is provided with two quartz-protected elements of 750-watts capacity. These are set at an angle of about 45° in the top of the oven, so that the cooking is largely done by direct radiation. Each element is controlled by a separate switch. A two-heat hot plate, maximum loading 900 watts, is provided on the top, and three normal-sized saucepans can be kept boiling. The oven easily takes a 6-lb. joint and other small viands.

A good general display is also being made by Edmundsons' Electricity Corporation. Automatic petrol-electric sets for country house lighting are shown; one is in operation on the stand, and miscellaneous fittings, some heating and cooking apparatus, vacuum cleaners, &c., may be seen. Other firms also are exhibiting vacuum cleaners of varying size and usefulness. On the stand of the British Vacuum Cleaner Co., Ltd., in particular, there are representative machines of every class. The most recent design of electric cleaner introduced by this Company weighs only 11 lb., and measures 14 in. by 7½ in. by 9½ in. A considerable amount of descriptive matter of the various machines is being distributed.

Another interesting stand to the electrical engineer is that of the Linolite Co. Here there are samples of the Woodhouse steel casing for encasing and protecting small wires. It is very unobtrusive, and takes less space than wooden casing, and may prove more convenient than screwed conduit, as well as being less unsightly for surface wiring. It is made of thin rectangular section galvanised steel in 3-ft. lengths. The under part is nailed or screwed to the wall, and the wires laid in place and the cover sprung into position. Joint clips, angles, tees, &c., are all quickly fitted in a similar manner, so that an electrically continuous circuit is provided. For getting over obstructions, such as cornice rails, a bendable casing has been introduced. This is also simple, and is an ingenious idea. It can be obtained in 5-in., 8-in., and 12-in. lengths. The outside dimensions of the standard casing are ¾ in. by 7⅞ in., and 1½ in. by ⅝ in. Some examples of the "Tubolite" system of lighting by tubular metal filament lamps in narrow polished aluminium or white enamelled reflectors are also on view. The reflectors are specially designed for different purposes, and can be made up into any length. The metal filament lamps have an average life of 1,000 hours at 1.45 watts per c.p., and are the same size as the old carbon filament lamps.

On the stand of the Altheat Co., Ltd., may be seen a new lamp radiator with humidifier with louvre front, treated with a special varnish so as to have a reddish appearance when the radiator is switched on. At the bottom there is a tank of water into which wicks depend from a funnel-shaped chamber, so that a current of heated air is circulated from the top of the radiator after being moistened by passing over the wicks. The design shown is very effective. In conclusion, it may be remarked that the numerous beautiful lighting effects obtained on almost every stand must be seen to be appreciated.

**The Development of Electrical Engineering.**—Dr. Edward Hopkinson's inaugural address to the Manchester Association of Engineers, delivered last Saturday, contained an interesting *résumé* of the history of the development of the dynamo. He mentioned the old machines shown at the Paris Exhibition of 1881, and dwelt upon the importance of the work of Dr. John Hopkinson from 1879 onward, which elucidated the conditions upon which the efficiency of the dynamo is based. He showed how the requirements of the earlier dynamos led to the development of the high-speed engine, and how, as the machines increased in size the multipolar design was evolved, and later the increasing commutation difficulties were met by the introduction of the auxiliary commutating pole. The question of speed came up in a new form on the introduction of the steam turbine, which called for higher speeds, introducing new problems, which were soon met with alternating current machinery, but had not yet been completely solved in the case of continuous currents. Turning to the development of the traction motor, he spoke of the gear and chain drives in the early tramways, the original direct-driven locomotives of the City and South London Railway, and the subsequent return to gear driving. He then spoke on the use of variable speed motors for general purposes, and in his concluding remarks referred to the accurate methods of measurement available in electrical engineering.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published October 9th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**  
 14,056/12. **Turbo-generator Field Magnets.** A. ROLFE. The interpolar space is filled by the windings. These consist of wedge-shaped bars arranged in an arch and fitted into a dove-tailed groove. The use of insulation other than that due to the natural oxide is not contemplated. Eleven figures.

18,571/12. **Storage Battery Electrodes.** C. DE SEDNEFF. Prism shaped electrodes are pierced with series of holes at varying angles, so that a mass of intercommunicating cells results. The active material in the cells also embraces metallic ribs. Ten figures.

20,733/12. **Storing and Utilising the Kinetic Energy of Railway Vehicles.** O. WULFERDING. An auxiliary car carries an axle-driven dynamo, storage battery, driving motors, and an automatic two-way switch worked by a centrifugal governor, so that above a predetermined speed the battery is charged, and below that speed the motors fed by the battery assist the main driving power on the train. Manual control is provided as well as the automatic control, so that, if necessary, the effects may be reversed. Three figures.

27,530/12. **Time Limit Circuit Breakers.** E. O. MÖLLER (British Westinghouse Co.). A series trip coil in the main circuit and a retaining coil in parallel with a shunt in the main circuit are provided. The retaining coil is controlled by a hot-wire relay in parallel with the main current shunt. In a modification, the two coils and relays are included in the secondary circuit of a series transformer. Two figures.

1,156/13. **Electrodes for Ozonisers.** J. C. A. HENDERSON. To increase the yield of ozone and the efficiency of the ozoniser, the electrodes are made of aluminium sheets, cut so that they may be expanded like the expanded metal in general use. It is said that the dielectric becomes more durable. Two figures.

1,804/13. **Incandescent Lamps.** O. SCHALLER. The lamp is made in two parts connected by an air-tight joint. The design is covered by specification No. 16,195/11, but it has been found that detrimental gases are given off from the packing (indiarubber, impregnated paper, &c.) there suggested. It is now proposed to make the leading-in conductors have a common perpendicular axis or converging perpendicular axis. As packing, lead under heat and pressure is suggested. Seven figures.

3,769/13. **Ozonisers.** J. STEYNIS. The apparatus comprises the combination of an air drier, ozone generator, refrigerator (compressor and condenser), and pipes for conveying a cooling medium from the refrigerator through the drier and generator. A by-pass from the drier to the compressor is also provided. A high concentration and efficiency are realised. One figure.

5,546/13. **Automatic Diaphragm Switches.** H. C. E. BOUTARD. A switch is actuated by the expansion of gas in a chamber, due to heat, through the medium of a diaphragm. To compensate for atmospheric variations, a chamber of similar construction is differentially connected with the heated chamber, so that all movements of the diaphragm due to the atmosphere are counteracted. One figure.

9,695/13. **Sea Water Temperature Annunciator.** A. McNAB. The indicator is placed in the hull of a vessel, and subjected to a continuous flow of sea water. The indicator itself consists of a thermometer containing conducting and non-conducting liquids, while a series of insulated conducting studs is provided, so that a test lever, whose position is determined by the height of the liquid columns (in turn controlled by the temperature of the water), closes circuit through the conducting liquid and an incomplete alarm circuit, part of which is formed by the insulated studs in the thermometer. Four figures.

12,565/13. **Pupin Coils.** SIEMENS & HALSKE. To avoid cross-talk and other effects on physical phantom circuit combinations. Pupin coils are made with the different coils divided into concentric sections. There is a different number of winding sections belonging to the separate coils in every plane of the winding, and an approximately uniform field distribution in every plane of the winding. Fourteen figures.

14,390/13. **Interpole Dynamos.** SIEMENS-SCHUCKERT. To reduce flux pulsations in the interpoles, windings are closed through a condenser with or without resistance and reactance, either directly or through a transformer. Alternatively a special winding may be used. Three figures.

16,454/13. **Series-Parallel Switches.** SIEMENS-SCHUCKERT. Switches for connecting two circuits in series or parallel are described. The fixed contacts of the series position co-operating with the movable arms are permanently cross-connected to the opposite movable arms. Thus there are two parallel paths when the reverser is placed in the series position. One figure.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** GRABHAM [Resistance composition] 27,500/12; B.T.-H. Co. (G.E. Co., U.S.A.) [Rubber-like material] 9,985/13.

**Dynamos, Motors, and Transformers:** SIEMENS DYNAMO WORKS and KIEFFER [Cooling] 21,822/12.

**Electrometallurgy and Electrochemistry:** HIGGINS [Electrolytic decomposition] 22,280/12; MORGAN CRUCIBLE Co. and SPIERS [Furnace crucibles] 24,626/12.

**Heating and Cooking:** MARKS (Landers, Frary & Clark, U.S.A.) 22,258/12; RUTHENBURG [Heaters for liquids] 47/13; RAVES [Heaters for liquids] 7,469/13.

**Incandescent Lamps:** B.T.-H. Co. (G. E. Co., U.S.A.) 23,086/12.

**Instruments and Meters:** WALL and FERRANTI Co. [Two-rate mechanism] 22,339/12.

**Storage Batteries:** FULLER, 22,053/12.

**Switchgear, Fuses, and Fittings:** DORAN [Switch] 20,270/12; GRIGSBY [Cord grips] 3,014/13.

**Telephony and Telegraphy:** AUTOMATIC TELEPHONE MANUFACTURING Co. (Automatic Elec. Co., U.S.A.) [Telephone systems] 19,249/12, 19,250/12, and 19,253/12; MCBERTY [Telephone exchange] 25,174/12; GRAHAM [Loud-speaking telephones] 25,911/12; GOTTSCHALK [Telephone transmitters] 26,964/12; RICHARDSON and McCULLUM [Working tyers, railway block telegraph instruments, &c.] 29,328/12; BETULANDER [Impulse transmitters for automatic telephones] 4,792/13; [Selectors] 6,465/13.

**Traction:** HANDCOCK, DYKES and DUDDELL [Railway signalling] 25,333/12; HEINZE [Magnetic wheels] 10,894/13.

**Miscellaneous:** CHESSIN [Determining a ship's position] 21,610/12; B.T.-H. Co. (G.E. Co., U.S.A.) [Coating and impregnating moulded materials] 22,449/12; GALLOWAY [Batteries] 2,402/13; BRITISH ERICSSON MFG. Co. and ROGERS [Enunciators] 5,626/13; SCHNEIDTZIK [Medical electricity apparatus] 13,145/13; MALONE [Temperature alarm] 17,112/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos, Motors, and Transformers:** BOUCHEROT [D.C. transformers] 19,588/13.

**Electrometallurgy and Electrochemistry:** KRUPP A.-G. [Electrodes] 17,925/13.

**Ignition:** KETTERING [Engine starting] 3,655/13.

**Instruments and Meters:** PAUL BRANN & Co. [Recording galvanometers] 20,796/13; STEPHENSON [Voltmeter] 21,143/13.

**Telegraphy:** OTTO [Synchronisation by waves] 20,798/13.

## Amendments to Specifications under Section 8

14,685/11. **Multiple Carbon Arc Lamps.** SIEMENS DYNAMO WORKS (Siemens-Schuckert.). The Specification deals with arc lamps in which a number of electrodes in parallel are used.

10,996/12. **Self-Starters for Internal Combustion Engines.** B. BROOKS and W. HOLT.

## Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** B.T.-H. Co. (G. E. Co., U.S.A.) [Flame electrodes] 14,196/04; SIEMENS DYNAMO WORKS and C. R. RIBER [Search light feeds] 13,580/08.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** F. KUHLO [Armoured cables] 13,489/08.

**Dynamos, Motors, and Transformers:** ELEKTRICITÄTS A.-G. VORM LAHMEYER [Protecting end coils from high pressures during switching] 11,168/04; J. C. LINCOLN [Adjustable speed shunt motor with movable conical armature] 13,427/06.

**Electrochemistry and Electrometallurgy:** A. LEVY [Removing metallic coatings by electrolysis] 13,666/08.

**Ignition:** H. DE LA VALETTE [Construction of magneto and distributor for varying the times of ignition] 13,252/05.

**Incandescent Lamps:** F. HARRISON [Spring supports for metal filaments] 26,294/07; P. G. TRIQUET [Supports for metal filaments] 13,449/08.

**Storage Batteries:** W. PETO (P. Gouin, France) [Traction battery plates with perforated ebonite shields] 12,954/01.

**Switchgear, Fuses, and Fittings:** R. F. VENNEN. R. C. GRIESBACH, and D. K. MORRIS [Remote control switch] 13,327/08; SIEMENS DYNAMO WORKS (Siemens-Schuckert) [Non-interchangeable cartridge fuses] 13,450/08.

**Miscellaneous:** K. HEINTZ [Bunsen cells] 13,671/08.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,360.

I have recently come into possession of a dynamo rated at 19 amps. 110 volts 1,400 r.p.m., but find that I cannot get more than 60 volts at this speed, 88 at 1,580 r.p.m., or 92 at 1,620 r.p.m. The armature is ring-wound, and the connections, &c., appear to be in good order. There is no sparking, but the armature and the bearings at the commutator end get rather hot. Is it advisable to run the machine at a still higher speed to obtain 100 volts, or would it be preferable to use lamps of lower voltage, if no method can be suggested to make the machine give the correct voltage at the right speed; and in this case what ampere capacity should be expected from the machine? It should be mentioned that the armature was recently re-wound, and it is possible that some error may have been made. What would be a fair cost for re-winding correctly if this is so?—"SMALLMAN."

(Replies must be received not later than first post, Oct. 23rd.)

### ANSWERS TO No. 1,358.

It is required to drive an existing planing machine with a 20ft. travel and vertical and horizontal feeds of 10in. with provision for three tools by individual motor drive. The machine is at present driven by belting on to a 24in. pulley running at 300 r.p.m., and there are stepped pulleys on the counter-shaft so that a 50 per cent. variation in the speed of the cutting stroke can be obtained in several stages. The usual automatic belt-shifting arrangement is provided to obtain a quick return, but the pulleys for this purpose could easily be removed if it is decided to obtain all the variation of speed by control of the motor. Give a specification which would enable an electrical firm to quote alternatively for a constant or variable-speed 500-volt continuous-current motor with complete control equipment.

The first award (10s.) is made to "W. H." for the following reply:—

Assuming the planer to be for average duty, about 40 h.p. would be required to drive same. First taking the constant speed motor, it would probably be cheapest to belt drive on the existing 24 in. pulley running at 300 r.p.m.

The specification should read as follows:—Contractors to supply a compound wound commutating pole motor capable of developing 40 h.p. continuously and overloads of 25 per cent. for one hour and 50 per cent. momentarily. Speed of motor about 500 r.p.m., and shaft to be fitted with pulley about 14½ in. diameter, to give a belt speed of 1,880 ft./min. Supply voltage, 500 D.C. Temperature rise of motor not to exceed 40° C. after six hours' full load. A high potential test of 2,000 volts to be applied for one minute between all windings and frame of machine. The motor is to be provided with covers to protect the moving parts from flying chips of metal. The following control gear is also to be supplied:—One starting rheostat fitted with no-volt and overload release, and capable of starting the above motor with full load current at infrequent intervals.

Alternatively, contractors are to quote on an electrical equipment suitable for varying the cutting speed by 50 per cent., and giving a high speed return stroke. For this purpose a motor with a speed variation of at least 3/1 and reversible is to be supplied, the horse power and voltage being as before,

but the motor, which is to be suitable for gear driving, is to have a speed variation of 300/900 r.p.m., and is to be reversible without shifting the brush position. The motor will require to be continuously rated at 40 h.p., and must be capable of withstanding the following overloads: 25 per cent. for one hour, and 100 per cent. momentarily at any speed over the whole range. Insulation tests as before. The motor must be capable of accelerating quickly and reversing quickly without sparking. The following control gear will also be required:—A set of contactor gear, suitable for starting up the above motor; for reversing same and for speeding up the motor by shunt field regulation. A field rheostat is to be supplied to give the required speed variation from 300 to 900 r.p.m., and also the necessary resistances for starting purposes. A suitable device is to be provided, which will be operated mechanically from the bed of the planer at each end of the stroke, and which will automatically operate the contactors, giving reversal of motor at each end of stroke and the necessary speeding up on the return stroke. It must be possible to set the speed of the motor during the cutting stroke at any point between 300 and 450 r.p.m., and a suitable mechanically operated switch must be provided, such that in case of a failure of supply of current, the planer bed will be prevented from overrunning by a braking effect, preferably produced by short circuiting the armature before the field has died away. In order to prevent rushes of current when speeding up, a relay must be provided to short-circuit a part of the field resistance if the current exceeds a predetermined value, and as soon as the current falls below this value to automatically reinsert the resistance. In order to work economically, it is desirable that the energy given up by the planer bed during retardation should be returned to the line in the form of current, either by strengthening the field automatically and thus generating current, or some other suitable means. It is also necessary that the contactors should open the circuit for reversing only when the current is at a low value. The necessary current limiting devices in the form of circuit breakers with overload and no-volt releases are to be fitted on the contactor panel.

The second award (5s.) is given to "Alph.," who writes as follows:—

There is little doubt that a more satisfactory result would be obtained by installing a variable speed reversible motor direct connected to the driving shaft of the planer and entirely eliminating the belting, &c., than by driving the planer by a constant speed motor and retaining the mechanical speed-changing and reversing devices. Although the purely electrical control is higher in first cost, it is much more efficient, eliminating the losses in the belting and also the wear and tear of the belts themselves; with a belt drive the unavoidable slipping of the belts at reversal and on heavy cuts not only involves very heavy friction losses and wear and tear, but also reduces the speed of operation, and thus decreases the output of the planer as compared with that obtainable with a direct-connected motor. This loss of output is a serious item, the time of operation with a direct-connected motor being reduced in some cases to 60 per cent., or even less, of the time taken by a belt-driven machine to perform the same work. Without full particulars of the class of work done on the planer, it is difficult to assign a rating for the motor, but from the particulars given it would seem that a 35-h.p. motor would be satisfactory for direct connection. The motor would not be working at full load continuously, and a one-hour rating would probably meet the case. The question does not state whether the 300 r.p.m. specified for the driving shaft corresponds to the maximum or the minimum cutting speed required, but we will assume it is the latter. A return speed of four times the minimum cutting speed (i.e., 1,200 r.p.m. on the driving shaft) will probably be about right, and will also be suitable for the motor, since a speed variation of about 4:1 is the maximum that can be obtained by shunt field control of a D.C. machine with certainty of good operation. The motor for direct connection will therefore require to be a variable speed reversible machine rated at 35 h.p., 300/1,200 r.p.m., 500 volts, with a temperature rise not exceeding 40° C. as measured by thermometer on the hottest part of the machine after running on full load for one hour. The motor should be fitted with commutating poles, and should operate without visible sparking at any load from no load to 50 per cent. overload, and all speeds from 300 to 1,200 r.p.m., in either direction; it should also withstand 100 per cent. overload for one minute without injury. It should be of the ventilated type and fitted with hooded covers arranged so as to prevent the possibility of metal chips, &c., falling into the motor, unless the arrangement of the planer is such that the motor is mounted high up out of the way of such chips. The machine will require a small amount of compound winding to give stability on the higher

speeds, but should have a shunt characteristic. The control gear will consist of two field rheostats (one for the cutting and one for the return stroke), starting and braking resistances, contactors for making the required connections, a master switch operated by dogs carried by the planer table, and a main switch and fuses. The field rheostats will be set by hand to give the required speeds. They should be marked "Cutting" and "Return" and provided with a scale calibrated to show directly the speed of the table in feet per minute. The contactors should be provided with the necessary mechanical and electrical interlocks to prevent the possibility of short circuits and to ensure that they cut out the resistance sections in the right order. They should also be provided with some form of current limit control to protect the motor from being overloaded by too rapid acceleration. With a properly designed contactor system a separate starting rheostat will be unnecessary, it being sufficient to close the main switch, when the contactors will automatically cut out the resistance in steps, and bring the motor up to speed, after which the operation will of course be automatic, reversing, acceleration, and braking being effected by the contactors, controlled by the master switch on the planer. If the table and work are heavy and the speed high (as is probably the case in this instance), it is advantageous to arrange the electrical braking with a resistance in series with the motor armature on the first step, this resistance being cut out in two or more steps, thus avoiding the heavy current rush which would take place if one braking point only (necessarily of comparatively low resistance) were provided. So long as the control equipment complies with the above requirements, it will be found more satisfactory, as well as cheaper, to leave the actual details to the makers, choosing, of course, a reputable firm who have had experience in similar work. The specification should state the range of speeds required in each direction, and also the approximate weight of the table with the heaviest work it is likely to handle, since this will materially affect the design and cost of the braking resistance, and possibly of the motor also. If a constant speed non-reversing motor is decided on, a rather higher rating should be specified to allow for the loss in the belting, &c. Probably a 45-h.p. motor on a one-hour rating would not be too large. The machine will, however, be somewhat cheaper than the 35-h.p. variable speed motor specified above, since it will be arranged for belt drive instead of direct connection, and is therefore not limited to a low speed. The actual speed may safely be left to the manufacturer, the purchaser specifying the size and speed of the driven pulley. The temperature rise should not exceed 40° C. after a full load run for one hour. The necessity for hooded covers will depend, as in the previous case, on the location chosen for the machine. The motor should operate sparklessly up to 50 per cent. overload, and without injurious sparking up to 100 per cent. overload, and should be compound wound in order to withstand the sudden overloads to which it will be subjected. The control gear will consist merely of the ordinary starting panel with switch, fuses, and starting rheostat. In addition to the necessary tests to determine that the apparatus will comply with the requirements specified above, the whole equipment, whether variable speed or constant speed, should have a flash test of 1,500 volts A.C. for one minute applied at the makers' works while the motors, &c., are hot after the heat run. The apparatus will also, of course, need to be fitted with the necessary protecting covers, &c., to comply with the Factory Regulations. Finally, it should be mentioned that the h.p. ratings specified above are only approximate, and should be checked by reference to the makers of the planer.

## NEW ENGINEERING LABORATORIES AT DUNDEE

THE new engineering laboratories which have just been completed at University College, Dundee (University of St. Andrews), were formally opened on Tuesday by Sir Alexander Kennedy. The cost of the new block with its equipment has been defrayed by a grant of £10,000 made by the Carnegie Trust for the development of the Scottish universities, and is from designs by Sir R. Anderson & Paul, architects in conjunction with Dr. A. H. Gibson, professor of engineering at the College. The department comprises a main building of two storeys, containing lecture-rooms, drawing offices, library, private rooms, and hydraulic laboratory, with a tower in which the ventilating machinery and a large storage tank is placed, and a wing containing a heat-engine laboratory and boiler-house, a strength of materials laboratory, a cement testing room, and a workshop. There is no fresh accommodation for electrical engineering, as the well-equipped Peters' electrical laboratory was only completed as recently as 1910. The heat-engine equipment comprises steam, gas, and petrol engines arranged for experimental work, and provision is made for the installation of a Diesel engine and a steam turbine in the near future. Steam is supplied by a Babcock & Wilcox boiler, with superheater, economiser, electrically-driven forced draught fan and feed-pump, and other auxiliary equipment. A 50-ton Buckton testing machine is

the principal item in the strength of materials laboratory. The hydraulic apparatus, which includes a Pelton wheel, a turbine, several pumps, and a 45-ft. flume, is very complete, and the workshop is provided with an equipment of machine tools. One, two, or three years' courses are arranged, and the degree of B.Sc. can be taken in civil, mechanical, or electrical engineering. A number of scholarships, exhibitions, &c., in engineering are open to competition.

## INDIRECT LIGHTING

THE illustration which is reproduced here has been sent us by the British Thomson-Houston Co. (Mazda House, 77 Upper Thames Street, E.C.), and represents an application of their well-known "eye-rest" system of indirect lighting in a large private house. In addition to

INDIRECT LIGHTING IN A DINING-ROOM.

the absence of glare, this system of lighting, owing to the even distribution, lends itself particularly well to showing up architecture and mural decorations, and renders separate lighting of pictures unnecessary. The bright illumination of the ceiling also gives an effect of height and space not obtainable otherwise.

**Awards at the Ghent Exhibition.**—A list of the awards accorded to British exhibitors has been published by the Board of Trade. The following are the awards in Group V. (Electricity):—**CLASS 23.—MECHANICAL PRODUCTION AND UTILISATION OF ELECTRICITY.**—*Grand Prix:* Electric & Ordnance Accessories Co., Ferranti, Ltd., Vickers, Ltd. *Gold Medal:* R. A. Lister & Co. *Silver Medal:* A. Sauvée & Co. **CLASS 24.—ELECTROCHEMISTRY.**—*Grand Prix:* Siemens Bros. & Co. **CLASS 26.—TELEGRAPHY AND TELEPHONY.**—*Grand Prix:* General Post Office, Siemens Bros. and Co., Western Electric Co. *Diplomas of Honour:* Gell Telegraphic Appliances Syndicate, H. W. Sullivan. *Gold Medals:* British Insulated and Helsby Cables, Burt, Bolton and Haywood, Lamson Pneumatic Tube Co., Peel-Connor Telephone Works. *Silver Medal:* Gent & Co., Oliver Typewriter Co. **CLASS 27.—MISCELLANEOUS APPLICATIONS OF ELECTRICITY.**—*Grand Prix:* Siemens Bros. & Co. *Gold Medals:* Gent & Co., Sient Electric Clock Co.

**New Publication.**—Messrs. Cassell & Co. announce that they are to-day publishing the second volume of Dr. Mullineux Walmsley's "Electricity in the Service of Man." This deals with the "Technology of Electricity," and is divided in two main sections on the Generation, Transmission, and Utilisation of electric power and the practical applications of small electric currents.

**The Faraday House Journal.**—In addition to numerous items of news as to the doings of Faradians, the current issue of this Journal contains special articles on the Amsler planimeter and on high-tension transmission. Biographical notices appear of Mr. G. Scott Ram (H.M. Electrical Inspector of Factories) and Mr. B. Sankey, who has just left the Whitehaven electricity undertaking for Port Elizabeth.

LONDONWorks:  
BEDFORD**ELECTRIC TRACTION NOTES**

In the October issue of the *General Electric Review* (New York), Mr. E. F. W. Alexanderson gives some information on the split-phase locomotive. This is the name given to locomotives in which polyphase driving motors are fed from a single-phase contact line, as is being done by the American General Electric Co. on the Norfolk & Western Railway, which serves the hilly Pocahontas district of W. Virginia (*ELECTRICAL ENGINEERING*, September 11th, p. 517). Mr. Alexanderson thinks that the polyphase induction motor is the most adaptable to all the different types of locomotive that are being considered as having points of advantage. An experimental split-phase locomotive has successfully been through some severe tests, and a six-axle locomotive, with six motors, is now being constructed. Each motor is designed to give 300 h.p. continuously, and a tractive effort of 45,000 lbs. at 15 m.p.h. and 30,000 lbs. at 22 m.p.h. A diagram of the connections of a split-phase locomotive, using the rotary phase-splitting device, is given. The phase converter is a machine like a standard two-phase induction motor, with the addition of an exciting winding on the rotor. The phase converter may be likened to a series transformer connected in one phase of a two-phase induction motor and supplying energy to the second phase. The secondary current is, however, substantially  $90^\circ$  out of phase with the

primary current. This is effected by the addition of the synchronous excitation whereby the magnetising current can be changed from positive to negative, and eventually made zero. The action of the motor will be the same as from a direct two-phase supply, except that the impedance of the phase converter must be reckoned connected in series with the motor. The impedance drop in the converter can be compensated, and the full output obtained from the motors by leading the current from the second phase through a section of the main transformer, whereby the action of the transformer on the circuit of the second phase becomes a source of supply of wattless current, because the transformer pressure applied to the circuit is  $90^\circ$  in advance of the current flowing in this circuit. By adjusting the amount of wattless current thus supplied, the combined characteristics of motor and converter are the same as the characteristics of a simple induction motor. Pressure control only is necessary so that the maximum torque of the motors is not limited by the minimum line pressures, but by the k.v.a. available corresponding to the maximum tractive effort that can be utilised.

Before proceeding further with Mr. Balfour's scheme for taking over the Stirling tramways and converting them to electric traction, the Council has decided to call in Mr. Peter Fisher, General Manager of the Dundee Corporation Tramways, to advise.

The Newport (Mon.) Corporation has been advised to promote a Bill in Parliament for trolley omnibus powers.

**Fencing Electrical Machinery.**—The Eccles Industrial Manufacturing Co. was on Monday fined £10 and costs for not properly fencing an electric motor. The prosecution by the Inspector of Factories followed on an accident which happened to an employee, and in spite of which the firm refused to take the necessary precautions.

**TELEPHONY AND TELEGRAPHY  
(INCLUDING WIRELESS)**

It is not necessary in this column to enlarge upon the details of the mid-Atlantic tragedy which has been in the minds of all this week, but we must take the opportunity of rejoicing that wireless telegraphy has again been successful in saving many lives, on a greater scale than ever before, not only in enabling nearly a dozen ships to concentrate in a few hours near the ill-fated *Volturro*, but in providing means of communication to facilitate a concerted plan of action.

The two new cables laid for the Italian Government between Syracuse, and Tripoli and Benghazi respectively were described by Mr. Jona in a recent issue of the *Atti della Associazione Elettrotecnica*. The cable in each case consists of 7/0.82 mm. stranded copper, insulated with three layers of gutta-percha to a diameter of 7.1 mm., giving a copper weight of 130 lb. per naut, gutta-percha 143 lb. per naut. Brass teredo-proof tape is used to protect the core of the deep-sea cable, as well as on the shore end and intermediate, as previous experience on the Naples-Palermo cable had shown that damage from the teredo had actually occurred at depths as great as 3,500 metres. The shore ends are armoured with ten galvanised steel wires of 9.6 mm. diameter, the intermediate cables with ten wires 6.5 mm. diameter, and with 10.5 mm. respectively, and the deep-sea cable with 15/2.5 mm. The Tripoli cable has a length of 281½ nauts. The Benghazi cable is 415½ nauts long, 78 per cent. of which is accounted for by the undulations of the sea bottom. It lies mostly at a depth of nearly two miles, the maximum depths being 4,400 metres, or over 2.6 miles. The cables were made by the firm of Pirelli & Co. The English cableship *Cambria* was employed in laying the Benghazi cable, and the *Citta di Milano* for the Tripoli cable.

A Brussels telegram states that wireless messages have passed between the station at Laeken, near Brussels, and Boma, in the Congo.

An interesting use of the telegraph lines in America was made on Friday last, when the blowing up of the Gamboa Dyke on the Panama Canal was controlled by President Wilson from Washington. A circuit of 4,000 miles over the land lines and cables of the Western Union and Central South American Telegraph Companies was made use of. The signal sent from Washington was retranslated at Galveston (1,556 miles), whence it passed over 793 miles of cable to Coatzacoalcas, 180 miles of the land lines of the Tehuantepec Railway, 766 miles of the Pacific cable to San Juan del Sur, and the remainder by cable to Panama, where suitable relays switched on the current to ignite the explosives. The removal of this dam is, of course, not the actual opening of the Canal, but it renders a considerable portion available to light draught vessels, although the Culebra Cut is still completely blocked, owing to fresh landslides.

The Bissao-Bolama cable failed on the 8th inst., and was put into working order again on the 10th. The line beyond Boraz Joon, Persia, has been restored, and telegrams can again be sent to Ahvaz, Mohammareh, Behbahan, and Shushter.

**The Mazda House News.**—The British Thomson-Houston Co. have just sent us a copy of the first issue of their new house journal, which they are distributing to the trade "to give information on Mazda House matters, and to stimulate electric lighting business." It should succeed admirably in both these respects, and thereby be of great use to contractors. Many sides of the illumination problem are treated by the aid of excellent illustrations, and an effective colour scheme, in conjunction with high-class printing, render the whole publication most attractive. Those who are desirous of availing themselves regularly of the information afforded by this journal are invited to send their names and addresses to the Publicity Dept., Mazda House, 77 Upper Thames Street, E.C.

## LOCAL NOTES

**Accrington: Gas Plant.**—During the course of the Electricity Committee's visit to view the Corporation's new gas plant, described in our issue of August 8th, p. 488, Alderman Higham, the Chairman, mentioned that the plant is now fully loaded, and that it will soon be necessary to take steps to increase it. As a matter of fact, the Electrical Engineer has been instructed to prepare plans and an estimate for a duplication of the present installation.

**Bangor: Electricity Tariffs.**—The Council has decided to increase the charge for electricity for lighting purposes by  $\frac{1}{4}$ d. per unit. The Committee's justification for this is that consumers are at present obtaining a reduction of 20 per cent. in their lighting bills by the greater efficiency of metal filament lamps.

**Derby: Charge for Heating and Cooking.**—The Corporation has adopted a recommendation of the Electricity Committee that consumers using electricity for cooking and heating as well as lighting be offered an alternative tariff on the rateable value system, the basis being 10 per cent. on the rateable value of the house, plus  $\frac{1}{4}$ d. per unit.

**Dublin: Electric Lighting Charges.**—The Electric Lighting Committee has been asked to report as to when it is intended to take off the extra charge of 10 per cent. which was imposed upon consumers three years ago. In agreeing that the matter should be reported upon, the Lord Mayor reminded the Council that since that time the cost of coal had increased from 10s. 6d. to 14s. per ton.

**Edinburgh: Electricity Tariff.**—The recommendation of the Electricity Committee to reduce the charge for private consumers from 2 $\frac{1}{4}$ d. to 2 $\frac{3}{4}$ d. per unit, together with certain other reductions in the discounts, has been adopted by the Corporation.

**Halifax: Electricity Tariffs.**—There was considerable opposition at the last meeting of the Corporation to the proposal of the Electricity Committee to modify the charges for electrical energy. The proposal was that for accounts up to 1,200 units per quarter 4d. per unit should be charged, with 2d. per unit for consumption in excess of that; whilst in the case of shop premises where electricity is the chief illuminant for lighting the interior, all current for exterior lighting in connection with advertising signs should be supplied at 2d. per unit, with a discount of 5 per cent. for prompt payment. The opposition in the debate came from the feeling which existed in Halifax between the Electricity and Gas Committees, the suggestion being that in the general interests of the town there should not be competition for customers in the matter of price between the two departments. Eventually the recommendation was passed by 25 votes to 24. The chief antagonism seemed to be with regard to the advantages offered for the use of current for outside window purposes, and, in spite of the fact that an amendment referring back the whole minutes was defeated, an amendment referring back that portion relating to outside shop purposes was subsequently passed, so that apparently the whole matter will have to come under the consideration of the Committee once more.

**Leeds: Purchase of Roundhay Electricity Co.**—There is considerable difference of opinion among the members of the Corporation as to a proposal by the Finance and Electricity Committees to take over the Roundhay & District Electric Lighting Co.'s undertaking at a cost of £12,390. Already the matter has been referred back once, and when it came before the last meeting of the Corporation there was a tie in the voting. In order to facilitate the other business of the meeting, the Chairman of the Electricity Committee took the recommendation back once more for further consideration.

**Liverpool: The Lister Drive Power Station.**—The reconstruction of Lister Drive No. 1 power station is making satisfactory progress, and it is anticipated that the water-tube boilers will be under steam next month. There are also on order two 6,000-kw. turbo-alternator sets for this power station.

**Redditch: Electricity Undertaking.**—At the last meeting of the Council, Mr. J. Blackford proposed that the Council should call a meeting of ratepayers to consider the advisability of selling the electricity undertaking, or of taking such other steps that might be thought best. It was pointed out that at present the undertaking involved a call upon the rates of some £3,000 a year, and objection was taken to the proposal to spend a further £10,000 upon the undertaking. Reference was also made to what was alleged to be the unsuitable site

of the works, and the suggestion was made that the undertaking, even as a municipal concern, could be made to pay if the works were removed to a more suitable site. Against this recommendation an amendment was moved by a labour member of the Council to the effect that an application should be made to the Local Government Board for a loan of £8,000 for extensions, and that the scale of charges be revised. Eventually further consideration of the matter was postponed until the Advisory Committee and the new Works Manager had reported to the Council.

**Scarborough: Proposed Purchase of Electric Lighting Co.**—Mr. J. W. Hame, City Electrical Engineer, York, has been retained by the Corporation to advise in connection with the proposed purchase of the Scarborough Electric Supply Co.'s undertaking.

**Stirling: Proposed Sale of Electricity Undertaking.**—Before going further into Mr. Balfour's offer to acquire the electricity and tramway undertakings, the Council has decided to request Mr. J. A. Robertson, the Borough Electrical Engineer at Greenock, to report with regard to the electric lighting undertaking, and Mr. Peter Fisher, General Manager of the Dundee tramways, to report with regard to the tramway undertaking. The Borough Electrical Engineer and the Borough Surveyor are also to be requested to furnish reports.

**Worthing: Street Lighting.**—In consequence of the satisfactory position of the electrical undertaking, the charge for street lighting is to be reduced by £300 per annum.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Accrington.**—A duplication of the present gas plant at the electricity works is contemplated.

**Bulgaria.**—Tenders are invited for the supply and erection of an electric station at the Penik State Coal Mine. Further particulars at 73 Basinghall Street, E.C.

**Crowle.**—The Council has been approached by two firms of consulting engineers with regard to an electric lighting scheme.

**India.**—Steam turbo-alternators for East India Railway Co. Secretary, Nicholas Lane, E.C. October 29th.

**London: Poplar.**—The Finance Committee of the L.C.C. recommends sanction to loans of £17,626 and £9,333 for extensions at the electricity works.

**Shoreditch.**—The Finance Committee of the L.C.C. recommends sanction to a loan of £6,706 for mains.

**Woolwich.**—The Finance Committee of the L.C.C. recommends sanction to a loan of £4,280 for mains, services, and meters.

**Loughborough.**—A L.G.B. inquiry was held last week concerning a loan of £14,000 for plant extensions. It is proposed to instal A.C. plant in conjunction with a Ljungstrom turbine. In connection with this latter, the Inspector deprecated spending money upon what he termed a new and untried thing, and said that standard machines were more reliable. At the same time he admitted that he did not know sufficient about the Ljungstrom turbine to criticise it one way or the other, but he thought that an undertaking like that at Loughborough should not indulge in anything approaching an experiment.

**Manchester.**—Storage battery, battery booster, and switch-board. Chief Electrical Engineer. October 29th. (See advertisement on another page.)

**Nottingham.**—Extensions are contemplated at an estimated cost of £35,000.

**Sal.**—Storage battery and battery charging booster. Borough Electrical Engineer. October 23rd.

**Stretford.**—Sanction has been received to the borrowing of £5,000 for cables and services, and £2,000 for meters.

**Walsall.**—A L.G.B. inquiry was held last week concerning

a loan of £4,840 for new plant at the electricity works. During the course of the inquiry, Mr. A. S. Barnard mentioned that the output for the present year to date is 12 per cent. in advance of what it was this time last year.

**Warrenpoint.**—It is stated that a firm of consulting engineers is advising the Council with regard to electric lighting.

**Waterford.**—Mr. E. M. Lacey's report upon the proposed electric lighting installation is now before the Committee, and he recommends a scheme at a cost of £27,338, of which the power station will absorb £16,200 and the distribution system £11,138. In addition, the street lighting scheme, in which 80-c.p. lamps on an average are to be employed, is estimated to cost £1,200.

**Wolverhampton.**—A L.G.B. inquiry was held last week concerning a loan of £22,000 for extensions at the electricity works.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Cardiff.**—Five shops and billiard hall. Architect, T. Thomas, Wenalt, Treharris.

**Clydebank.**—Block of buildings for Clydebank Co-operative Society.

**Dumfries.**—Electric lighting, telephones, and electric clock installation at new county buildings. Consulting Engineer, W. Arnot, 163 Hope Street, Glasgow.

**Falmouth.**—Secondary school. Education Department, County Hall, Truro.

**Finchley.**—New swimming baths.

**Fleetwood.**—New secondary school.

**Grantham.**—Elementary school. Secretary, Education Committee, Guildhall.

**London.**—Cinematograph hall in Wells Street, Camberwell.

**Southwark.**—New coroner's court.

**Manchester.**—Carnegie library at Didsbury. Town Clerk, October 22nd.

**Middlesbrough.**—Extensions to high school buildings.

**Motherwell.**—County hospital. District Clerk, Hamilton, October 23rd.

**Newport (Mon.).**—Cinematograph theatre, Cross Keys. Architects, Wilmott & Smith, 29 St. Mary Street, Cardiff.

**Salford.**—Cinematograph theatre, Gardiner Street, Pendleton.

**Torquay.**—New theatre (£20,000).

**Worksop.**—The electric lighting of the workhouse has been decided upon.

### Miscellaneous

**Australia.**—The Victorian Railway Commissioners require a 60-h.p. electric motor and accessories. Further particulars, 73 Basinghall Street, E.C.

**Dublin.**—The Great Northern Railway Co. of Ireland requires a twelve months' supply of electrical fittings and material, cables, and arc lamp carbons. Secretary, November 1st.

**London.**—The Port of London Authority requires a twelve months' supply of electrical sundries. 106 Fenchurch Street, E.C. November 5th. (See advertisement on another page.)

A twelve months' supply of opal lamp shades, &c., for H.M. Office of Works. (See advertisement on another page.)

**Spain.**—Electric crane for Valencia Harbour. Further particulars, 73 Basinghall Street, E.C.

### TENDERS RECEIVED AND ACCEPTED

**London: L.C.C.**—The following tenders have been received for high-tension switchgear at the Greenwich power house:—Bertram Thomas, £10,823; the British Westinghouse Co., £17,915; the B.T.H. Co., £20,112 10s.; Siemens Bros. Dynamo Works, £20,673 13s.; Ferranti, £22,304; Johnson & Phillips, £22,886; and A. Reyrolle & Co., £24,351. The tender of the British Westinghouse Co. has been accepted.

The tender of the British Westinghouse Co. at £5,943 has been accepted for reactance coils and steel valve chests in connection with protective devices for the Greenwich generating plant.

**Hammersmith.**—Seventeen tenders have been received for a twelve months' supply of high- and low-tension cable. The

sizes of cable required are:—High tension, 0.25, 0.1, and 0.05 square inch; low tension, 0.3, 0.2, 0.15, 0.1, 0.08, 0.05, and 0.025 square inch, and  $\frac{1}{2}$  twin. The tender of the Western Electric Co. has been accepted at £825 6s. for one drum of each size for immediate delivery. The basis price of future supplies has been taken at £21 per ton for lead, and £75 per ton for copper. The lowest price tendered for the first drum of each size was £649 14s., and the highest price £1,039.

Sixteen tenders have been received for high-tension switch-panels for distributing sub-stations, and the lowest, that of Switchgear & Cowans, Ltd., at £9 11s. 8d. per panel, has been accepted. The highest tender was £52.

The tender of the General Electric Co. at £324 10s. has been accepted for a 125-h.p. A.C. motor.

### APPOINTMENTS AND PERSONAL NOTES

Mr. W. W. Lackie, Chief Electrical Engineer to the Glasgow Corporation, and Bailie Smith, Convener of the Electricity Committee, have just returned to Glasgow after an extended tour of inspection of electric power undertakings in the United States and Canada.

Mr. E. J. Nalley has been appointed Vice-President and General Manager of Marconi's Wireless Telegraph Co. of America.

Mr. Robert Onions, the General Manager of Richard Hornsby & Sons (Stockport), has now become Works Manager to Mirreles, Bickerton & Day (Hazel Grove, Stockport). At a meeting of Messrs. Hornsby's employees, Mr. Onions was presented with a silver rose-bowl and a set of vases.

Mr. C. E. Hunter, Director of the Edison & Swan U.E.L. Co., Ltd., has been appointed to the Board of the Altrincham Electric Supply, Ltd.

We regret to read in a local paper that Mr. J. A. Cawthra, who was for some years Borough Electrical Engineer at South Shields, has been killed in a motor-car accident in South Africa. Mr. Cawthra left South Shields two years ago to take up an important position with the Victoria Falls Power Co.

Mr. R. E. Meade, Borough Electrical Engineer at Stafford, has resigned.

The salary of Mr. G. H. Watson, Assistant Electrical Engineer to the Hereford Corporation, has been increased from £117 to £130 per annum.

An Assistant Sales Manager is required by the Sunderland Electricity Department. (See advertisement on another page.)

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Theatre Lighting.**—We are requested to state that the contractors for the supply of Osram lamps in the installation at the London Opera House, illustrated on p. 570 of ELECTRICAL ENGINEERING of October 9th, were the British Economical Lamp Co. (9 Old Bailey, E.C.).

**Electrical Supplies.**—The Electrical Supplies Co. announce that they have commenced business at 41 Cheapside as wholesale dealers in electrical apparatus, and will be glad to receive catalogues with best discounts from manufacturers.

### COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Newcastle-on-Tyne Electric Supply Co.**—An issue of £400,000 five per cent. second mortgage stock is being issued at 95. This issue is required to repay outstanding mortgages and other extensions of the works.

**Dick, Kerr & Co.**—The accounts given in our last issue were adopted at the meeting on Thursday. Mr. C. T. Cayley, who presided, congratulated the shareholders on the improved results compared with last year, and also upon the fact that the works are at present extremely busy in all departments.

## SUMMARY

AN announcement is made regarding a well-known firm of switchgear manufacturers. (Page 590.)

A SERIOUS disturbance occurred on the Metropolitan Electric Supply Co.'s system on Monday. (Page 590.)

THE *Tynemount*, which is the first ship on a large scale to be equipped with Mr. H. A. Mavor's system of electric propulsion, is now complete. The vessel is driven by two 300 h.p. Diesel engines, which are coupled to alternators supplying current to one large slow-speed induction motor driving the propeller. Special arrangements are made for varying the speed. (Page 591.)

SOME details are given of the electrical installation at the new building of the Institution of Electrical Engineers. (Page 592.)

A QUESTION on the relative merits of different house wiring systems is given in our Questions and Answers columns. (Page 593.)

AN illustration shows the temporary lighting during the refronting of Buckingham Palace. (Page 593.)

A NEW system of connecting emergency push-buttons for stopping motors has been introduced. (Page 593.)

SHORT articles illustrate a new electric grinder and an electric sign. (Page 594.)

THE Sterling Telephone and Electric Co. has moved its showrooms into commodious premises in Tottenham Court Road. (Page 594.)

THE large scheme of tube railways for Sydney has

been rejected. No arrangement can be come to by the Brighton and Hove Corporations with regard to the trolley 'bus scheme. The Newport tramways manager complains at having to bear so large a proportion of road-repairing charges, inasmuch as the tramcars only use the rails. (Page 595.)

THE liquidation of the National Telephone Co.'s assets is almost completed. Wireless communication is to be established between Nauen and the German African colonies. (Page 595.)

Two patents relating to Aron meters expire during the current week. Opposition has been entered to the grant of several patents. The specifications published on Thursday last include one by W. Morrison for varying the torque obtainable from a petrol-electric drive for vehicles. Among the others may be mentioned two for liquid immersion heaters by E. A. Raves and M. Ruthenburg respectively. (Page 596.)

A START will shortly be made with the Birmingham Corporation 100,000-kw. new power station.—A bye-law providing for the licensing of wiremen has been passed in Wellington (N.Z.).—Manchester Corporation propose to take over the supply of electricity in Trafford Park.—The South-Eastern Power Co. has offered a bulk supply to the Dover Corporation. (Page 597.)

EXTENSIONS of plant and mains are contemplated in a large number of towns, including Bedford, Fleetwood, Hindley, Norwich, Rathmines, Rawtenstall, Rhyl, Warrington, and Watford. A considerable number of new electric lighting schemes are also projected. (Page 597.)

MESSRS. DRAKE & GORHAM have taken up the supply of electrically propelled vehicles. Some further particulars of the Wireless Electric Light Co. are given. (Page 598.)

**Junction-Box Fire.**—Some excitement was caused on Sunday night, about 7 o'clock, at the corner of Norfolk Street, Strand, near the Temple Station, by a junction-box explosion and fire in the pavement, followed by a second slight explosion in a similar box near by. The fire, however, was soon got under, and no one was injured. The cables in question, which are those of the Charing Cross, West End & City Electric Light Co., are insulated with impregnated paper, lead-covered, and laid "solid" in bitumen. The failure causing the trouble originated not far from the box where the first explosion occurred, at a point where the cable passes close to a Post Office box, and appears to have been due to mechanical damage to the lead covering, caused possibly when work was being done on the adjoining Post Office box. This allowed water to enter the cable, destroying the insulation.

**Electric Light Switching.**—A. P. Lundberg & Sons (477 to 487 Liverpool Road, Islington) have brought out a new edition of their pamphlet, entitled "The Teaching of Electric Light Switching," and the collection of opinions of the first edition of the booklet printed on the cover testify to its utility. There has been some slight rearrangement of the matter, and the outline lectures are now grouped into three grades or courses. Particulars are also included of the firm's free examination scheme, and a description is added of the sectionalised system of circuits for demonstration purposes which they recently introduced.

## FERRANTI SWITCHGEAR A New Policy

WE are informed that Ferranti, Ltd. (Central House, Kingsway, W.C.), after careful and lengthy consideration, have decided no longer to undertake switchboard contracts, the reason being briefly that they find their capacity entirely required for the growing manufacture of standard catalogue lines, including meters, power and instrument transformers, switchboard instruments, oil switches, knife switches, circuit breakers, motor starters, and heating and cooking apparatus. Their large experience in the manufacture of switchboards and switchboard details should ensure for them a very considerable clientèle amongst switchboard manufacturers for such details as they themselves do not manufacture, in view of the fact that they will no longer be competitors for such contracts. Their withdrawal from this field, in which they were particularly prominent, must necessarily benefit those remaining in the field, and there is every reason for them to hope for special consideration from those with whom they have until recently been in active competition when orders or contracts for detail gear are being placed. It should be mentioned that the whole of the staff of the switchboard department are remaining in their employ. There is little doubt that a good many manufacturers are prejudicing their chance of success by expending too much energy upon the manufacture of small sections of their requirements, of which they could be easily and profitably relieved by anyone specialising and manufacturing in large quantities. It is not unlikely that an appreciation of this consideration may lead to an extension of this movement.

**New Ediswan Showrooms.**—We are informed that the Edison & Swan United Electric Light Co. (Ponders End, Middlesex) have taken a lease of the imposing building at present occupied by the London Shoe Co. at 123-125 Queen Victoria Street. They will enter into possession shortly, when arrangements will be made for a special entrance from Upper Thames Street for the counter trade, and other alterations will be carried out which will make the large hall one of the finest electrical showrooms in London. In the meantime, the business will, as usual, be carried on at Queen Street and College Hill, where a very large stock of Royal Ediswan lamps, electrical fittings, and accessories is carried.

## ARRANGEMENTS FOR THE WEEK

FRIDAY, OCTOBER 24TH.

*Physical Society.*

5 p.m. At Imperial College of Science, South Kensington. Included in the agenda is "An Electrostatic Oscillograph," by H. Ho and S. Koto.

SATURDAY, OCTOBER 25TH.

*Association of Mining Electrical Engineers.*

5.30 p.m. Warwick and S. Staffs Branch. At Imperial Hotel, Temple Street, Birmingham. "Installation and Manipulation of Coal Cutters," by J. McCann.

MONDAY, OCTOBER 27TH.

*Institution of Electrical Engineers: Western Section.*

3.30 p.m. At Merchant Venturers' Technical College. Chairman's Address, by H. Faraday Proctor.

**Breakdown on the Metropolitan Electric Supply Co.'s System.**—An unfortunate breakdown, which necessitated a shut-down for nearly an hour, occurred at the Willesden station of the Metropolitan Electric Supply Co. at about six o'clock on Monday. A large step-up transformer burnt out, and the primary burnt through to the secondary. Although the generators themselves did not suffer, the leads on the low-tension side and also the synchronising gear were badly affected, and it took some time to clear and to get current restored to the trunk mains to London. On the low-tension mains connected to battery sub-stations supply was maintained, but the volts fell from about 200 to 150. On the premises connected to these mains it was interesting to see the different effect of this reduced pressure on the carbon and metal filament lamps; the latter gave a light which was still quite useful, but the carbon lamps glowed only at a red heat. It is the first breakdown that the Company have had for many years, and they are greatly to be sympathised with that it should have occurred at peak time and have been so extended.

**Imperial College of Science and Technology.**—Among the scholarships which have been awarded by the Governing Body and the Delegacy for the Session 1913-14 are entrance scholarships of the value of £40 per annum each, tenable at the City and Guilds (Engineering) College, in the Department of Electrical Engineering, to R. F. H. Nalder, R. H. Barfield, and G. S. Oddie.

SALESMAN:—We have some very nice patterns in the Adams style, sir.

CUSTOMER:—No, I think I should prefer something more in the Eve's style, with apples and serpents and things.

## THE ELECTRICALLY DRIVEN SHIP "TYNEMOUNT"

WE have on several previous occasions referred to the building of the *Tynemount*, which is one of the first applications on a large scale of the electric propulsion of ships, and details of the system employed have been described by its designer, Mr. H. A. Mavor, in Papers read before the British Association and elsewhere. (See *ELECTRICAL ENGINEERING*, Sept. 12th, 1912, p. 505). The vessel is now complete, and we are able to give a few more details of her equipment, with illustrations of the actual apparatus employed.

It will be remembered that the *Tynemount* has been built for service on the canals and great lakes of North America. She is a cargo boat 250 ft. long by 42 ft. 6 in. beam and 19 ft. moulded depth. The general appearance is shown in Fig. 1. Although the main propulsion is by Diesel engines

levers of the starting gear and for cutting off the blast for stopping the engines are placed close alongside the electrical controllers, so that the whole control is carried out from one point. The position of the engines and certain auxiliaries can be seen in Fig. 2.

Each engine drives a three-phase alternator of special design made by Mavor & Coulson. The alternators have an out-

FIG. 1.—THE MOTOR SHIP "TYNEMOUNT."

FIG. 2.—GENERAL ARRANGEMENT OF PROPELLING MACHINERY.

with electric transmission of power to the propeller, a certain amount of auxiliary machinery is steam-driven from two oil-fired donkey boilers. The main engines are two in number, and are of the six-cylinder enclosed four-stroke marine Diesel vertical type, manufactured by Mirrlees, Bickerton & Day, Ltd. (Stockport). They are each capable of developing 300 B.H.P. at 400 r.p.m., and have cylinders 12 in. diameter by 18½ in. stroke. The engines are started by compressed air in the way usual with land engines, and each has its own three-stage compressor mounted on an extension of its shaft. Owing to the electrical transmission, they do not require to be stopped or reversed for manœuvring, so that extra large compressors and stores of compressed air do not have to be carried as in the case with the complicated reversible equipments of most Diesel-engined boats. The

put each of 270 amperes per phase at 500 volts at 400 r.p.m., and they are provided respectively with six and eight poles, so that they supply current at frequencies of 20 and 26.6 cycles per second. An exciter is direct coupled to each alternator. The current from these two generating sets is led to the 500-h.p. induction motor which drives the propeller. The position of this motor is shown in Fig. 2, while its appearance in the engine-room is seen in Fig. 3. This motor was also made by Mavor & Coulson, and is of special construction. The rotor is of the squirrel-cage type, but the stator is provided with two different and entirely separate windings, one giving 30 and the other 40 poles. When these two windings are supplied with current at 20 and 26.6 cycles respectively, they give the same synchronous speed of 80 r.p.m. The motor will then absorb the full power of both engines and drive the propeller, to which it is direct-coupled at about 78 r.p.m. This propeller speed corresponds to the fastest speed of the vessel. In order to obtain a slower speed, the connections are altered so that the 20-cycle alternator supplies the 40-pole winding, and the synchronous speed of the motor is now reduced to 60 r.p.m. In this case the engine of the 26.6-cycle alternator can be shut down, but as the speed of the ship has been reduced to about three-quarters of full speed, half the total horse-power is

FIG. 3.—INTERIOR OF ENGINE ROOM LOOKING AFT.

ample. It will be seen that the two alternators, when they are both at work, are connected to entirely different circuits, and are never run in parallel, so that no synchronising gear is required, and indeed synchronising operations would not be at all suitable for shipboard conditions. The reversal of the motor is performed by interchanging the connections of two of the phases. A diagram of connections is given in Fig. 4.

The switchgear by means of which the necessary changes

of connections are made is very simple, and consists of main controller of the tramway type, with five positions for full ahead, half ahead, stop, half astern, full astern, and a second controller which introduces resistances into the exciter circuits. These controllers are shown in Fig. 5. The contacts in both cases work under oil, but it is inadvisable that the contacts of the main controller should be required to break the large main current flowing to the motor. The two switches are therefore interlocked, so that it is impossible to work the main switch except when all the resistance has been introduced into the exciter circuits.

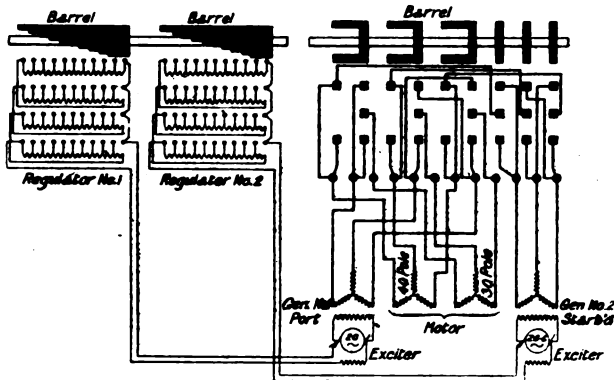

FIG. 4.—DIAGRAM OF CONNECTIONS.

Thus the whole handling of the ship is carried out by two levers which are so interlocked as to be foolproof. In the present instance these switches are in the engine-room, but it is evident that by lengthening the connecting cables they could be placed on the navigating bridge. The number of electrical instruments has been kept down to a minimum. There are only provided one ammeter and one voltmeter to each alternator, and an ammeter and voltmeter for each exciter.

The system of electrical drive permits the speed of the ship to be altered without variation of the engine speed. It also provides a convenient "gear ratio" to enable the engines and the propeller respectively to be run at their most efficient speeds, and also permits of rapid reversal of

FIG. 5.—CONTROLLERS.

the propeller while the engines continue to run in their normal direction. In many cases the system allows of a reduction in the machinery space, thus increasing the cargo capacity of the vessel. It also lends itself readily to distant control, and in any case where it may be found advisable the switchgear can be put on to the bridge and the control of the propelling motor put into the hands of the navigating officer. The *Tynemount* was built by Swan, Hunter & Wigham Richardson, Ltd., Wallsend, to the order of the Electric Marine Propulsion Co., a company which has been formed to develop the system associated with the name of Mr. Henry A. Mavor, to whom our thanks are due for having put at our disposal the material from which this article and its illustrations have been prepared.

**Obituary.**—Those of our readers who knew Mr. O. F. Mould, the genial manager of the Western Electric Co.'s publicity department, will regret to hear that he died last Thursday after an unsuccessful operation for appendicitis on the previous Monday.

## ELECTRICAL INSTALLATION AT THE NEW BUILDING OF THE INSTITUTION OF CIVIL ENGINEERS

THE handsome new building in Great George Street which is the new home of the Institution of Civil Engineers, and was inaugurated at the dinner of the Institution last night, is considerably larger than the quarters on the other side of the street which the Institution was forced to vacate owing to the expansion of the new Government offices. It is not our purpose here, however, to describe its undoubted architectural beauty, nor the spaciousness of its accommodation, but rather to call attention to a few points of interest in the electrical installation.

The supply for lighting and power is taken from the mains of the Westminster Electric Supply Corporation, and a three-wire service at  $2 \times 200$  volts (continuous) is brought in in the lower basement through the meters and oil-immersed main fuses provided by that company. The Institution's main switches are of the iron-clad type mounted on a skeleton iron frame, and from these separate leads are taken in iron pipes to each of the main distribution boards in the upper basement. The whole of the gear in the lower basement is to be enclosed in an expanded metal cage to prevent unauthorised access. The main distribution boards are in a special room immediately above. There is one 400-volt board for the lift and other power circuits, which are ten in number, and well away from this and well apart from each other are the two 200-volt boards on the two sides of the three-wire system. Each of these contains nine lighting circuits and five circuits for the power plugs about the building which are provided for vacuum cleaners. All these boards are of slate on iron frames, and the double-pole linked switches and porcelain fuses are of the "Kartret" type. This pattern of switch and fuse is also used throughout on the local distribution boards on the various floors, but the switches are here single pole. Particular care is taken in the numbering and labelling of the circuits and sub-circuits. All the wiring is in solid drawn screwed conduit let into the walls during construction, and all wires were drawn in.

The lighting of the smaller rooms, which is, of course, entirely by metal filament lamps, does not present any very special features. Semi-indirect lighting is employed to some extent in the entrance hall and passages, and some handsome cut-glass bowl fittings have been provided. The most striking room is the great hall, 100 ft. long by 45 ft. wide and of the same height, with a fine scheme of decoration in marble. This is at present lighted by temporary fittings, consisting of two large electroliers carrying in all 120 40-watt lamps, each with its own "Superlux" shades. The lecture-room opens into the great hall, and as regards its dimensions (66 ft.  $\times$  40 ft.), panelling, and fixtures, is practically a replica of the old lecture-room which was familiar to many of our readers. The arrangement of the seats, however, is slightly different. The system of lighting adopted is similar to that which provoked so much discussion at the lecture-room of the Institution of Electrical Engineers—that is to say, that main illumination is by lamps concealed in the cornice so that the light is reflected by the white ceiling. This indirect illumination is supplemented by four 5-ampere Cooper-Hewitt mercury vapour lamps, arranged two in series on the 200-volt circuit, which give light through the glass dome in the middle of the ceiling. The cornice lamps are of the tubular type mounted horizontally. There are 186 20-watt lamps in all, equally spaced round the room. The trough in which they are mounted is specially shaped and painted white. No mirror reflectors are used. The cornice concealing the lamps is at a height of 20 ft. above the floor. Two special experimental circuits are brought to the lecture-table direct from the main intake, one from the Westminster Co.'s continuous-current system, and the other from the alternating mains of the London Electric Supply Corporation. A special lantern chamber is provided at the side of the room.

Electric fans are used extensively in connection with the ventilation scheme. The great hall and the lecture theatre are ventilated on the plenum system, but exhaust fans are also provided. All these larger fans are driven by 8-h.p. continuous-current motors. The other rooms are mostly provided with smaller exhaust fans only, and the air in their case enters through steam-heated radiators on the "Nuvacuumette" system, in connection with which an electrically-driven vacuum pump is used.

There are in all five electric lifts. Three of these are 13-cwt. automatic push-button passenger lifts, with a maximum speed of 150 ft. per min., one is a 80-cwt.

car switch control goods lift with a maximum speed of 110 ft. per min., and the remaining two are service lifts down from the kitchen on the top floor to carry 1 cwt. each. The lift-motors all run off the 400-volt circuit. The type of lift adopted is provided with V-sheave drive and not drum-drive, and it is interesting to note that during their tests they were driven hard against the top and bottom stops, with all the safety gear put out of action, without any damage being done. This was rendered possible largely by the slipping of the ropes in the sheave grooves. Very complete interlocking of the gates and control is provided, and a dashpot arrangement on the main controller renders it impossible to start the lift again until a definite interval has elapsed after its last stoppage, so that the car cannot be fetched away by pressing a button on another floor before there has been time to open the gate.

In conclusion, we must express our thanks to Mr. E. W. Monkhouse, under whose direction the electrical installation was carried out, for kind assistance in affording us information.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,361.

If a 60-light 3-storey house were to be wired on the "tree" system, but utilising screwed barrel, modern connection boxes with porcelain interiors, and also specially designed continuity iron fuse boxes, why would it still be incorrect practice? (Replies must be received not later than first post October 30th.)

### ANSWERS TO No. 1,359.

No reply worthy of an award has been received.

## AN EMERGENCY PUSH BUTTON SYSTEM

IN any system of push-buttons for stopping motors in case of emergency, reliability is the first consideration, and the ordinary method of making the push-button short-circuit the coil of the no-volt release is apt to fail when the resistance of the leads to the distant push-button is considerable. The arrangement of the push-button to break the circuit of the no-voltage coil is also objectionable in cases where this coil is in series with the motor field coils. To meet these objections, the Igran Electric Co. (147 Queen Victoria Street, E.C.) have introduced a new patented distant stop push-button system which breaks the no-volt circuit without interrupting the field circuit. The push-button is provided with two sets of contacts. If both of these were in contact at once, there would be two paths for the field current of the motor—one through the no-volt magnet coil, and the other quite independent of the no-volt magnet coil. Normally, however, these two sets of contacts are not both in contact, but only that set which passes the field current through the no-volt magnet coil, so that in this position the no-volt magnet is excited and holds up the starting lever. But when the stopping button is pressed, it first presses the other set of contacts together (thereby making the field circuit independent of the no-volt magnet circuit), and then, while holding these usually open contacts closed, it opens the normally closed contacts, thus breaking the no-volt magnet circuit and positively letting the starter handle go. The

arrangement of connections for an ordinary shunt motor is shown in the figure, and a simple modification can be made for compound motors. The apparatus is particularly valuable in enabling the Home Office regulation for factories to be complied with, which requires that:—

"In every place in which machines are being driven by any electric motor there shall be means at hand for either switching off the motor or stopping the machines if necessary, to prevent danger."

### LINES.

### EMERGENCY STOP PUSH-BUTTON SYSTEM ARRANGED FOR SHUNT MOTOR.

The Electrical Inspector of Factories, in his memorandum on the effect of these regulations, says:—

"The former (namely, compliance with the above rule) can be effected by extending the motor circuit to the machines, and there providing an additional stopping switch, but it will usually be less costly to provide an auxiliary switch with push-buttons near the machines, arranged to operate the circuit-breaker, which may be near the motor, thus avoiding having to extend the motor circuit."

## TEMPORARY LIGHTING AND LIFTS AT BUCKINGHAM PALACE

AN elaborate scheme of lighting of the scaffolding during the reconstruction of the front of Buckingham Palace,

NIGHT VIEW OF SCAFFOLDING AT BUCKINGHAM PALACE.

which is now practically completed, was arranged to enable the work to proceed by night as well as day. The photograph reproduced here, which was sent us by the Edison & Swan United Electric Light Co. (Ponders End, Middlesex), shows the effect obtained, and is excellent testimony to the illuminating power of the Royal Ediswan drawn wire lamps, which were exclusively used. It will readily be seen also that the rough nature of the work, and the fact that as the work proceeded the positions of the lamps were being continually changed, were good tests of the strength of the filaments.

Electric power was also made use of in the two 80-cwt. electric lifts which were temporarily installed by R. Waygood & Co., Ltd., to facilitate the conveyance of workmen and material to the different stages of the scaffolding.

### A PEDESTAL GRINDER

FOR grinding castings, sharpening tools, and a host of other similar purposes, the self-contained electric pedestal grinder is of great utility. A tool of this description, which

PEDESTAL ELECTRIC GRINDER.

is now being manufactured in quantities by the Witton - Kramer Electric Tool & Hoist Co. (for whom the General Electric Co., Ltd., 67 Queen Victoria Street, E.C., are the sole selling agents), is shown in the accompanying illustration. This particular machine is driven by a 2-h.p. totally-enclosed three-phase motor, with bearings of extra length and spindle of large diameter extended at either side to carry grinding wheels. The spindle is solid, and is not an ordinary motor spindle with extension pieces driven in. These sets are made with either three-phase or continuous current motors, and are controlled by small iron-clad switches conveniently accommodated inside the pedestal, and operated through casting. The wheels are effectively protected by means of sheet-steel guards. Tool-rests are provided, which are adjustable in several directions. The machines are designed on substantial lines to enable them to withstand rough treatment.

### ELECTRIC SIGNS

IT is often said that we are behind other countries in the use of electric signs. This is certainly not due to any want of appreciation of the value of advertising, but many be attributed rather to the fact that electrical contractors and others responsible for the actual selling of these appliances have not sufficiently realised the magnitude of

SHOP WINDOW SIGN, 6 FT. LONG, FINISHED IN OXYDISSED SILVER.

the unexploited field that there is for their activities in this direction, especially in the provinces. A shop window must be lighted, and the electrical contractor should induce his shopkeeping clients to use a window sign which can be designed not only to light the window well, but also with the same light to draw attention to their name or to the

special claims of their wares. The window sign, which may often be conveniently controlled by a time switch, often leads to the adoption of electrically illuminated outside signs, of which so many attractive forms are available to suit any class of business. An attractive window sign which has been supplied to a number of depôts of a boot and shoe business by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), is illustrated here. This firm make a speciality of this class of work, and assure us of their willingness to give contractors every assistance in their power by suggesting suitable types of signs and by producing special designs.

### STERLING TELEPHONES

WE recently had the pleasure of a view of the fine new offices, show-rooms, and stores of the Sterling Telephone & Electric Co., Ltd., at 210-212 Tottenham Court Road, London, W. The building itself, which is about four times as large as the old offices in Upper Thames Street, has been entirely renovated, redecorated, and fitted with the latest labour-saving devices suitable for the purpose in hand. Entrance is obtained through double doors to the counter, drawing office, &c., while to the left is the show-room, and to the right the main staircase leading to the managing director's and secretary's offices, waiting-rooms, export department, &c., on the first floor; while above this there are three floors devoted to stores and a workshop for small urgent repairs. In the basement is a test-room where all instruments are re-tested to see that they have not been put out of adjustment since leaving the works at Dagenham. The whole building is well lighted on the semi-indirect system, with special local lighting where required. Complete systems of goods lifts and pneumatic tubes have been installed, while a 20-line secret automatic system of intercommunication telephones is being erected. It is only necessary for the person originating the call to move the index to the number designating the person required and to press a button, when, if the line is free, connection is made and locked against interference until released by the called person. It is interesting to note that the leads are black enamelled and covered with paraffined cotton. Thus a high insulation is obtained. The Company, we understand, will shortly be introducing these enamelled wires into its many productions. Another item of particular interest is the bell-signalling system. The bells are of the balance-wheel type, in which when once started single strokes are given at short intervals until released by a push button from the calling end. To effect this, the bells are fitted with a wheel and projecting pin, so that when the armature circuit is opened on the first stroke the wheel is given a blow, which rotates it until it completes the circuit again, when the cycle is repeated.

In the show-room we saw a number of these bells and a quantity of robust gas- and water-tight telephones, switches, &c., suitable for use in mines and other similar industrial positions. In addition, there is a complete range of the well-known "Sterling" shot-firers, which comply with the latest Home Office requirements for firing from two to eighty shots. For general use the Company has a telephone wall-set, in which the microphone is fitted on a parallel arm so that it is always truly vertical. Of great interest also are the Ferro-case telephone sets, which are very compact and the component parts easily detachable. They are neat and very suitable for export requirements. The pressure of space permits us but to mention that there are numerous other specialities on view. All are of solid construction, and the parts easily replaceable. Included are examples of Government telephones, large orders for which the Company holds for this country and abroad, while any requirements for domestic houses, colonial service, railways, &c., can be quickly met.

**Electric Cooking.**—The opening meeting of the Birmingham & District Electric Club was held on Saturday last at the Birmingham Electric Supply Department's Show Room. Mr. W. E. Milns, of the Birmingham Corporation, gave a lecture on "Electric Cooking," with various demonstrations. A large number of ladies attended. The lecturer commenced by dealing with the ideal oven, and showed how the electric oven was the nearest approach to this ideal. Various types of ovens were compared, and hints given on their selection. Actual figures of costs were put forward to show that on the score of expense electric cooking compared favourably with any other form. A year's cooking for a family, including the electric heating of two rooms, electric kettles, irons, &c., worked out at no more than £10. Advice as to the economical use of ovens was given, and it was shown that on an intelligently selected menu, one or two courses could be cooked after current was actually switched off.

IGRANIC

SWITCHGEAR

LONDON and BEDFORD.

## CATALOGUES, PAMPHLETS, &amp;c., RECEIVED

**HEATING AND COOKING APPARATUS.**—A small folder from the Dowsing Radiant Heat Company (105 Great Portland Street, W.) describes the new small hot bar radiator and new small oven, of which particulars were given on page 581 of last week's *ELECTRICAL ENGINEERING* in connection with the Ideal Home Exhibition.

**TEMPERATURE INDICATORS.**—A supplementary sheet to catalogue No. 502 has been issued by Siemens Bros. & Co., Ltd. (Woolwich), in which some high resistance temperature indicators with pivoted coil and compensating resistance are described. The instruments have a resistance of about 16 or 17 ohms per millivolt. A 10 ohm regulating resistance with index is provided.

**DOMESTIC HEATING AND COOKING.**—A pamphlet just issued by the Sun Electrical Co., Ltd. (118-120 Charing Cross Road, W.C.), mentions a new cheap 4 and 6 lb. iron with fire-proof connector and spring support for the flexible. Another innovation is a self-contained kettle. The elements project right into the water, and besides giving a high efficiency, it is claimed that "furring" is prevented. A cooking outfit, consisting of hot plate, aluminium kettle, saucepan, and frying-pan, priced at one guinea, is also listed, as is a substantial boiling plate and some radiators and convectors.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**ADVERTISEMENT WRITING.**—Mr. Ernest Ingram Hill (26 Stanton Road, Wimbledon, S.W.), who was the winner of the first prize in the "Printers' Ink" advertisement competition in 1911, has sent us an illustrated leaflet on this subject, copies of which he offers to send anyone on application.

**SYNCHRONISATION OF CLOCKS.**—We have received from Greenwich Time, Ltd. (106 Albany Street, N.W.) details of a scheme for supplying synchronised clocks, giving a complete time service. The clocks are automatically wound by means of dry batteries. They are set to a slightly gaining rate, and synchronised every four hours. In large installations only the master clock is synchronised from Greenwich, and this in turn controls a series of secondary clocks.

**CANDLE FITTINGS.**—A special form of candle fitting, provided with an expanding adapter arrangement which ensures the candle always standing upright, is described in a leaflet from the Candolite Co. (65 and 67 Knightbridge Street, E.C.).

**"DAY LIGHT" REFLECTORS FOR MERCURY VAPOUR LAMPS.**—A revised sheet has just been published by the Westinghouse Cooper Hewitt Co., Ltd. (80 York Road, King's Cross, N.), in which reflectors giving a daylight effect for use with mercury vapour lamps are described. These reflectors make use of the phenomenon of fluorescence, and the light is described as being of an agreeable white colour, with a slight rosy tint.

**INDIRECT AND SEMI-INDIRECT LIGHTING.**—A folder is being sent out to business houses, factories, &c., by Electrical Installations, Ltd. (27 Martin's Lane, Cannon Street, E.C.), in which the company points out the need for good lighting, and urges the adoption of the indirect or semi-indirect systems.

## ELECTRIC TRACTION NOTES

According to the *African World*, preliminary investigations have been made as to the cost of railway electrification on the Wynberg and Sea Point lines, Cape Colony, and on the Springs-Randfontein line.

The £4,800,000 tube railway scheme recently passed by the New South Wales Legislative Assembly has been rejected by the House of Assembly.

It is stated that a complete deadlock has arisen in connection with the trolley omnibus schemes of the Brighton and Hove Corporations.

In view of the success of the provisional service of trailer cars on the L.C.C. system, the Board of Trade is to be asked to sanction their use throughout.

The conversion to electric traction of the rack railway from Wilderswyl, near Interlaken, is now practically complete, and preliminary trials have been run with the four new locomotives prior to the official tests. The full service will be opened for the next season in May next.

The Aberdare tramway and trolley omnibus system, which has cost £50,000, was inaugurated last week. The total length is about  $7\frac{1}{2}$  street miles.

The Newport Tramways Manager, Mr. N. J. Young, has raised a question as to whether the Works and General Purposes Committee should not bear a larger proportion of the cost of the road repairs than at present. He bases his suggestion upon the fact that the tramcars only use the rails, and that as there is an interval of five or six minutes between cars on every route, it is clear that the ordinary vehicular traffic is practically the sole cause of the wear on the roads.

TELEPHONY AND TELEGRAPHY  
(INCLUDING WIRELESS)

It is stated that the liquidator of the National Telephone Co. has practically liquidated all the assets of the Company, and intends to make a further payment of 7 per cent. on the deferred stock, making a total of 104 per cent. received by the preferred shareholders. The possibility is also mentioned of a final distribution of 1 or  $1\frac{1}{2}$  per cent.

According to the *Times* Berlin correspondent, the Chairman of the Post Office authorities has decided to open wireless communication between Nauen and the German-African colonies next year. By that time there will be at the Nauen station five towers each 120 metres high, in addition to one 250 metres high.

The proposal of Marconi's Wireless Telegraph Co. to create 500,000 new ordinary shares of £1 each has been sanctioned by the statutory extraordinary general meeting.

The Falmouth-Bilbao cable was restored on the 14th inst., and the Singardja-Amperan lines were put in order on the 16th. The Chio-Tenedos cable failed on the 17th. The *via* Moulmein route to Siam was down on the 18th between Raheng, Bangkok, and Myitta Kanburi. Telegrams are being sent *via* Madras-Saigon. The Tenedos-Lemnos cable broke on the 19th inst., and telegrams for the former place are being posted. Code language is again admitted for telegrams to Turkey. During the interruption of the Eastern Co.'s cables, telegrams for Salonika and other Greek offices in the annexed territories are sent *via* Larissa-Salonika, with delay and at senders' risk. The Western Telegraph Co. do not often figure in these notices, but on the 20th their Pernambuco-Ceara and Ceara-Maratham cables ceased operating, and telegrams for the Ceara district are being forwarded by the Brazilian land-lines.

**Osram Week.**—Encouraged by the great success of their previous special autumn advertising campaigns, and in response to the requests from the trade all over the country, the General Electric Co., Ltd., are again conducting an "Osram Week," and a large portfolio is being circulated to explain the details of the scheme. The Company have removed from their offer of this year the condition associated with previous Osram Week campaigns which called upon contractors to place an order for a specified number of lamps. Many entirely new and extremely effective advertisement designs have been prepared—some of the best and most ingenious we have seen—and will appear on an unprecedented scale in almost every class of paper interesting lamp-users. The names of contractors who participate in the scheme will appear in these advertisements, and material will also be supplied free of charge to them for window displays, as well as advertising literature over-printed with their names and addresses.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published October 16th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**  
 21,612/12. **Petrol-Electric Vehicles.** W. MORRISON. A magnetic clutch has a rotating armature and rotating field magnet. One is connected to the prime mover and the other to the load. The field windings and a storage battery are connected in parallel across the armature. The field resistance and battery pressure are simultaneously adjusted to give the desired torque by a combination of different series and parallel connections, while the whole field and battery still take the maximum armature pressure. Seven figures.

21,641/12. **Lamp Indicator.** J. MARTIN. To indicate when an invisible lamp has gone out an alarm circuit is completed through two insulated metal strips with different expansions, e.g., steel and brass, mounted above the lamp. Eight figures.

22,053/12. **Storage Battery Electrodes.** G. FULLER, L. FULLER, and G. J. A. FULLER. The active material is compressed in moulds so that the finished "solid" plates have the true section of either a rectangular or cylindrical cell, and can be fitted together with separators to form a solid accumulator. Ten figures.

23,086/12. **Filament Shaping Machine.** B.T.-H. Co. (*G.E. Co., U.S.A.*). A machine for shaping squirted or wire-drawn filaments for special purposes, such as automobile and miniature lamps, is described. Seven figures.

25,333/12. **Railway Signalling.** H. W. HANDCOCK, A. H. DYKES, and W. DUDELL. An alternating current is used for track circuit signalling, and operates the signals through an electro-magnet and condenser turned so as not to be affected by strong currents of different frequency.

26,964/12. **Solid Back Telephone Transmitter.** F. GOTTSCHALK. The construction allows of spanning means, clamping springs, and exterior nuts for clamping the diaphragm to the resistance cell being dispensed with. The stem of the back electrode is enclosed by a chamber with openings only for the insertion of the resistance cell and the locking screw. A metallic diaphragm under initial stress and self-adjusting is used. Ten figures.

47/13. **Liquid Immersion Heater.** M. RUTENBURG. A resistance wire is wound inside and outside a hollow cylinder of silica having a series of holes or notches at each end to engage the wires. Two figures.

2,402/13. **Storage Batteries.** C. GALLOWAY, JNR. A vent consists of a number of passages open to the gas space at one end and directly to the atmosphere at the other. The ends of each passage are arranged closely adjacent to the inner surface of the cell at points remote from each other. Seven figures.

7,469/13. **Liquid Immersion Heater.** E. A. RAVES. A flanged electrode is fitted within a perforated metal bulb, which is inserted in the liquid to be heated. The bulb is connected as the second electrode. Two figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** YOUNG [Supply systems] 22,852/12; BROWN, BOVERI ET CIE. [Regulation] 27,069/12; SIEMENS-SCHUCKERT. [Remote control of synchronous motion] 687/13; A.E.G. [Motor regulation] 7,896/13; JULIUS-PINTSCH A.-G. [Railway-car lighting] 15,082/13.

**Dynamos, Motors, and Transformers:** PRICE [Dynamos for vehicle lighting] 19,345/12; HOLMES [Brush holders] 22,985/12; THOMAS [Motors] 26,396/12; ETHELLE, CONGDON & MUIR, and MUIR [Electric braking of motors] 27,482/12; MASCH. OERLIKON [Apparatus for winding] 14,633/13.

**Electrometallurgy and Electrochemistry:** LEE and BRAME [Holding articles which are to be electroplated] 26,765/12; FARBWERKE VORM MEISTER, LUCIUS and BRÜNING [Obtaining nitrogen and nitrogen oxides simultaneously] 3,662/13.

**Ignition:** SCHAAER [Rotary distributors for multi-cylinder engines] 22,438/12; THORESEN and OLSEN [Magneto driving] 24,691/12; "MAFAM" MOTOR APPARATE GES. [Magneto] 1,093/13; ROYER [Electrically-heated igniters for internal-combustion engines] 7,302/13; REIFFERN (*Julius-Pintsch A.G.*) [Railway vehicle gas lamp control] 15,080/13.

**Switchgear, Fuses, and Fittings:** BERRY and MARKHAM [Switches] 22,118/12; GREEN [Control of electrically-driven mechanisms] 22,646/12; RECORD [Terminals] 763/13; HIRST and STRACHAN [Interlocking switchgear with box lids] 2,636/13; HOVLAND [Relays] 10,472/13; CHIGER [Timing gear for switch operation] 10,559/13.

**Telephony and Telegraphy:** ELLERO [Transmission of pictures] 24,758/12; HILL [Selective signalling] 2,612/13; SIEMENS & HALSKE [Supervisory circuits] 7,531/13; THOMPSON (*Ges für Drahtlose Telegraphie*) [Receivers for wireless] 8,821/13; BAUDISCH [Reels for laying field telephones] 17,563/13.

**Traction:** BERGMAN [Automatic equalisation of tramway and railway loads] 14,846/12.

**Miscellaneous:** SEVERY and SINCLAIR [Vibratory musical instruments] 19,868/12; HILL [Alarms for engines and machines] 22,412/12; HANSON, LANGSTON and E.P.S. Co. [Miners' safety lamps] 22,738/12; LOWE [Primary cell electrolyte] 27,634/12; FARKAS [Advertising] 29,892/12; ACHENBACH [Primary cells with gelatinous electrolytes] 832/13; LEAVITT [Gyroscopic steering of torpedoes] 6,163/13 and 7,160/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos, Motors, and Transformers:** HARTMANN [Packing joints of metal vapour A.C. rectifiers] 20,300/13.

**Electrochemistry:** SOC. ANON. L'OXYHYDRIQUES FRANÇAISE [Electrolysis of water] 18,818/13.

**Telephony and Telegraphy:** BALSILLIE [Transmitter for wireless] 15,673/13; [Receiver for wireless] 15,674/13; ARNTZENIUS [Switching system for order wire uni-directional telephone service between two exchanges] 21,735/13; SIEMENS & HALSKE [Semi-automatic telephone systems] 21,766/13.

**Miscellaneous:** RABBIDGE [Absorbents for dry batteries] 19,783/13; OTTO [Remote control of marine or aerial torpedoes for manœuvring] 21,212/13.

### Application for Amendment of Specification

19,763/12. **High-Frequency Currents for Wireless.** W. DUBILLIER. It is desired to correct a clerical error in Fig. 6 of the drawings accompanying this specification, which was abstracted in ELECTRICAL ENGINEERING, August 21st, p. 481.

### Opposition Entered to Grant of Patents

19,963/12. **Ignition Magneto Pole Shoes.** O. BÄRTSCH. The specification describes designs of pole shoes for giving a strong spark for advanced or retarded positions.

1,420/13 and 1,439/13. **Electrolysis.** H. M. DU BOIS. The process described is for the production of caustic soda by the electrolysis of sodium chloride. The electrolyte flows from anode to cathode through a gas-proof seal, and then across the electrolytic field within a space between the cathode and a porous diaphragm.

2,610/13. **Private Telephone System.** E. A. GRAHAM and W. J. RICKETS. Either one of a pair of stations can call the other. The call is reproduced at the calling station.

### Expiring and Expired Patents

The following Patents expire during the current week, after

the of fourteen years:—

21,354 and 21,355 of October 25th, 1899. **Meters.** H. ARON and THE ARON ELECTRICITY METER. The first specification gives a construction for an automatic electric winding mechanism for clock trains, &c. The construction given is an improvement on that first described in specification No. 24,876 for 1894. The second specification describes a method of metering for three-phase installations with four conductors, in which only three conductors are utilised, together with the pressures from them to the fourth conductor. From the sum of these readings, the action of the current in the third conductor combined with the sum of these same pressures is deducted. In a clockwork meter a third coil is arranged between two pendulums, and simultaneously affects them, in addition to the individual currents acting on them. In a motor meter, two separate magnet coils act on two armatures, so that one is influenced by one current, the other by the second current, and both by the third current.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, &c.:** B. G. LAMME [Running commutator motors off three-phase supply] 12,418/05; B.T.-H. Co. (*A.E.G.*) [Haulage, rolling-mill, and similar systems] 14,161/08.

**Dynamos, Motors, and Transformers:** UNION ELEKTRICITÄTS GES. [A.C. commutator motor brushes of equal potential are separately supplied] 13,283/04.

**Electrochemistry:** C. MASON [Oxidisable metals are given a metallic coating before the final electro-deposit] 13,715/08.

**Incandescent Lamps:** H. KUZEL [Mounting squirted metal filaments] 15,017/07; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Tungsten filaments are made by replacing the carbon of carbon filaments by tungsten in a vacuum furnace and sintering] 15,367/07.

**Instruments and Meters:** E. WESTON [Moving coil portable and pocket volt and ampere meters] 14,547/02.

**Telephony:** B.T.-H. Co. (*G.E. Co., U.S.A.*) [Homopolar is used as generator or converter for power supply] 14,789/06.

## LOCAL NOTES

**Action: Electricity Undertaking.**—A statement prepared by the Borough Treasurer says that last year the number of units sold under the agreement with the Metropolitan Electric Supply Co. was 1,306,941, compared with 760,696 in 1910-11, the final year of working by the Council. The position of the undertaking was regarded as satisfactory, but one of the two opponents of the sale to the Company took the opportunity of reminding the Council that they had done a foolish action in parting with the undertaking.

**Ayr: Electricity Accounts.**—The net profit on the electricity undertaking last year was £241, against £755 in the previous year. The gross revenue, however, was £316 in advance of the previous twelve months, and satisfactory increases in all departments were reported.

**Birmingham: New Power Station.**—A start will shortly be made with the foundations of the new 100,000-kw. power station at Saltley, to which reference has already been made in these columns.

**Carnarvon: Electricity Undertaking.**—The National Electric Construction Co., which is running the local electricity works under lease from the Corporation, has found it necessary to increase the price of current for lighting purposes from 5d. to 6d. per unit. To this the Corporation has taken some exception, as when the works were first started the Company stated that there was very little likelihood of the price being increased beyond 5d. In reply, the Company state that they have up to date lost £7,000 on the working of the undertaking, and that the step they have taken is as much in the interests of the Corporation as of the Company, as under the terms of the lease the Company has to meet the capital charges on the money borrowed by the Corporation.

**Dover: Bulk Supply.**—The South-Eastern Electric Power Co., which is developing works at Tilmanstone, has offered to supply the Corporation in bulk. The Borough Electrical Engineer estimates that an expenditure of £4,500 will be necessary on converting plant for dealing with the Company's 11,000-volt supply. Consideration of the matter has been adjourned pending further information from the Company.

**Hebburn: The Trouble with Electric Cables.**—It is anticipated that the Board of Trade inquiry with regard to the trouble experienced some time ago in Hebburn from the electric cables will be held in London. Experiments are being carried out upon samples of bitumen used in the districts for the purposes of this inquiry.

**Manchester: Electric Supply.**—It is probable that in an omnibus Bill to be promoted by the Corporation next session, powers will be asked to purchase the Trafford Power & Light Supply (1902), Ltd., which will, of course, give the Corporation powers to supply in Trafford Park.

**Newport (N.B.): Purchase of Electricity Works.**—There is a suggestion that the Town Council should purchase the electricity undertaking belonging to the adjoining township of Wormit.

**New Zealand: Licensing Wiremen.**—The Wellington Council has adopted a bye-law providing that no person shall undertake electrical work in the city unless licensed as a master wireman or journeyman wireman.

**Pontypridd: Cooking.**—Messrs. Gillespie & Beales, of Amberley House, Norfolk Street, Strand, the sole wholesale selling agents for "Tricity" cookers, have recently organised a successful demonstration of electric cooking with the "Tricity" cooker. The lectures and demonstrations were given by Mr. F. S. Grogan, of the British Electric Transformer Co., Ltd., who interested large audiences twice a day during the past week. The interest and enthusiasm shown augurs well for the future of electric cooking in this area, and the rapid development of a big cooking load on the Urban District Council's mains is likely to occur. In an appreciative paragraph, the *Glamorgan Free Press* refers to "the perfect results which are unflinchingly attained without labour, worry, or care"; and adds that Mr. Grogan "scatters the bogey of expense to the four winds, and proves that the thrifty housewife can gain all the unquestioned advantages of electric cooking, ironing, &c., and actually show a saving in hard cash on the year's expenses."

**Swinton: Street Lighting.**—It is proposed to extend incandescent lighting to all the tram routes, two 50-c.p. lamps being fitted to each span wire. The estimated cost is put at £192 per annum, compared with £269 for the present gas lamps.

**West Ham: Electrical Bulletin.**—The October issue of the West Ham Corporation electrical service bi-annual bulletin

contains an interesting article on electric vehicles, and descriptions of the electrically-driven machinery in a pianoforte factory, a laundry, and a cycle and motor-car repairing works.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Bedford.**—A 1,000-kw. mixed-pressure turbo-alternator with exciter and condensing plant, also water-tube boiler with mechanical stoker and coal-handling plant, is required. Chairman, Electricity Committee, November 12th. (See advertisement on another page.)

**Bitterne.**—An electric lighting proposal by the Southampton Corporation is to be further considered.

**Burnham.**—Dr. J. A. Purves, who is promoting a local company for the supply of electricity, communicated to the Council a short time ago that unless the capital were reduced by about £1,000 by placing overhead wires instead of underground mains, the company could not be floated. The Council has now been informed that all the shares in the company have been taken up, and that the original scheme for underground mains will be carried through.

**Egypt.**—The Egyptian Government requires six 3,950 k.v.a. and five 875 k.v.a. three-phase 5,000-volt generators, switchboard, sub-stations, and a 40,000-volt transmission line. Consulting Engineers, Messrs. Harper Bros. & Co., 13 St. Helen's Place, E.C.

**Ellon.**—The proposed electric lighting scheme by Messrs. T. Smith & Co. is to be carried out.

**Fleetwood.**—A loan of £2,500 for electrical extensions is to be applied for.

**Hindley.**—A loan of £2,500 for electrical extensions is to be applied for.

**India.**—The Allahabad Club requires a generating plant consisting of oil engine and 20-kw. dynamo, together with battery. (See an advertisement on another page.)

**Kenilworth.**—A consulting engineer is to be engaged to advise upon an electric lighting scheme.

**Knaresborough.**—An electric lighting scheme, utilising the water power at a local mill, is to be reported upon.

**Maidstone.**—A L.G.B. inquiry was held last week concerning a loan of £6,120 for plant extensions.

**Manchester.**—Two 5-ton electric derrick cranes. R. Carlyle, Elsinore Road, Old Trafford.

**Moffat.**—The Council has abandoned an electric lighting scheme involving the use of water power, but is negotiating with regard to an alternative proposal.

**Newport (Mon.).**—A loan of £10,772 has been sanctioned.

**Norwich.**—A L.G.B. inquiry was held last week concerning a loan of £25,000 for electrical extensions.

**Pickering.**—The proposed electric lighting scheme is to be further considered by the Council.

**Rathmines.**—A 400-kw. generating set (tandem dynamos). Borough Electrical Engineer, November 4th.

**Rawtenstall.**—A loan of £10,000 for plant and mains extensions is to be applied for.

**Rhyl.**—A loan of £3,900 for the purchase of an additional Diesel engine set is to be applied for.

**Tasmania.**—Oil-cooled transformers, underground cable, and H.T. switchboard are required by the Launceston City Council. Copy of the specification may be seen at 73 Basinghall Street, E.C.

**Trowbridge.**—Messrs. Samuel Salter & Co., Stone Mills, require a 200-ampere 115-volt dynamo and switchboard; also wiring for 250 lights.

**Warrington.**—A 2,000-kw. turbo-alternator, condensing plant, &c., and water-tube boiler. Borough Electrical Engineer, October 28th.

**Watford.**—A loan for three years' requirements of mains and services, to include also dealing with the Council's extension order granted last session, is to be applied for.

FOR  
STEAM JOINTS  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Barnsley.**—New theatre, Doncaster Road.

**Blackburn.**—New fire station (£24,960). Architect, W. Stirrup, Richmond Terrace.

**Croydon.**—Thirty-four houses in Meadvale Road. A. J. Fraser, 1 Mortimer Road, West Ealing.

**Dundee.**—New school. Architects, Maclaren, Son & Sowter, 10 Reform Street.

**London: Islington.**—An electric lighting scheme has been adopted for the two workhouses and school belonging to the Guardians. The estimated cost is £3,372.

Ninety-five lighting points in Colebrooke Row Special School, and 180 lighting points at Chelsea County Secondary School. (See an advertisement on another page.)

**Malifax.**—New theatre.

**Ipswich.**—Additions to isolation hospital. Architect, H. Munro Courtley, The Thoroughfare.

**Lowestoft.**—New school.

**Sheffield.**—Additions to north-east wing, University of Sheffield. Architects, Gibbs, Flockton & Teather, 15 St. James Row.

**Swansea.**—New sanatorium.

**Margate.**—New fire station.

### Miscellaneous

**Banbridge.**—Tenders are invited for public lighting for three years. Town Clerk.

**Glasgow.**—Twelve months' supply of stores, including electrical machinery for the Caledonian Railway Company. 302 Buchanan Street.

**Russia.**—British firms desiring to tender for electric lighting on the Russian State railways should notify the Minister for Ways of Communication, St. Petersburg.

## TENDERS RECEIVED AND ACCEPTED

**Cleethorpes.**—The contract for prepayment meters has been placed with Messrs. Chamberlain & Hookham.

**South Africa.**—The South African Railways & Harbours Administration has accepted the tender of the A.E.G. Electrical Co. of South Africa for the supply of 36,000 train-lighting lamps.

## APPOINTMENTS AND PERSONAL NOTES

Mr. H. F. Osler, late Chairman of Messrs. F. Osler, Ltd., electrical fittings makers, of Birmingham, has, after making a number of bequests, bequeathed one-third of the ultimate residue of his estate to the Birmingham University.

Mr. Arthur Chamberlain (brother of the Rt. Hon. Joseph Chamberlain, M.P.), who died last week, was Chairman of Chamberlain & Hookham, Ltd.

Mr. W. H. Hulhall, who was formerly associated with Siemens Bros.' Dynamo Works, Ltd. (Dalston) as traction lamp expert, has been transferred to the Glasgow branch to handle their general electrical business in that district.

Mr. L. Lee, Chief Meter Inspector to the Watford U.D.C., has resigned, and Mr. V. A. Woodland, at present Assistant Meter Inspector, has been promoted.

An engine-room assistant is required in the Stepney Electricity Department. (See an advertisement on another page.)

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. George Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £78 to £78 10s. (last week, £76 to £76 10s.).

**Metal Filament Lamps.**—Pope's Electric Lamp Co. (Hyth Road, Willesden) are issuing the following letter to their customers:—"After many verbal threats of proceedings, which we were unable to trace to a definite source, we have at last

been asked in writing for the names of our solicitors. We therefore expect, and indeed welcome, legal proceedings, and would remind our customers our indemnity holds good."

**Ghent Exhibition Award.**—The Grand Prix awarded to Ferranti, Ltd. (see page 584 of our last issue) was for an exhibit including a high-tension three-phase motor panel of the totally enclosed interlocked type, such as they supply in large quantities for works, sub-stations, &c.

**A New Cable Works.**—The Macintosh Cable Co., Ltd., have installed a complete plant for the manufacture of high- and low-tension paper-insulated lead-covered cables, and inquiries addressed to the following from the districts indicated will receive prompt attention:—*South of England:* Gillespie & Beales, Amberley House, Norfolk Street, Strand, London, W.C. *Manchester and District:* Chas. Macintosh & Co., Ltd., Cambridge Street, Manchester. *Liverpool and District:* W. Rickard, Dale Street, Liverpool. *Newcastle and District:* F. H. Morley, Star Buildings, Newcastle-upon-Tyne. *Export inquiries:* F. Hardy-Smith, 19-21 Fore Street Avenue, London, E.C. The new company is financially controlled by Messrs. Chas. Macintosh & Co., Ltd., and the works and registered offices are situate in Rice Lane, Walton, Liverpool.

**Gillespie & Beales.**—This firm, by taking up the sole selling agency for the south of England for the Macintosh Cable Company, have made a new departure, as their agencies have so far not included one for heavy lead-covered paper cable. Their agencies, together with their business, as factors for some of the leading electrical firms, and their third department, viz., that of expert buyers for foreign and colonial clients, now cover a very wide field in the electrical industry.

**Ediswan Advertising.**—The Edison & Swan United Electric Light Co. are carrying out a wide and effective advertising campaign. A fine new poster has appeared on the hoardings, designed by Francis Barraud, and in rich oriental colouring. The subject-matter is explained by the inscription: "Sun Worship—A Pardonable Error." A more personal appeal to attention is being made by postcards with an Ediswan lamp and suitable wording printed in front; these are being sent out in batches to customers and other friends with their own address printed at the back, so that they may use them and assist Ediswan lamp publicity. Some compact cases of paper matches for the waistcoat pocket are being distributed also, each match bearing a reminder of Ediswan activities, and last but not least, some of the firm's friends have received an ingenious two-blade pocket knife which contains an 18-in. steel spring tape measure, reading both in inches and centimetres—an extremely neat and well-made arrangement.

**Removal.**—We have been asked to announce that Haseltine, Lake & Co. have recently removed to 28 Southampton Buildings, W.C. All correspondence should bear this address.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Drake & Gorham.**—The report and accounts given in our issue of October 9th, page 576, were adopted at the meeting last week. Mr. B. M. Drake, who presided, referred to the company's share of the better-class work during the year, and expressed regret that at present no diploma or examination is necessary for plumbers and men of other trades to qualify for carrying out electrical wiring work. The best protection for the public was to deal with old-established firms who had a reputation to maintain, even though this might mean having to pay a slightly higher price for of course considerably better quality work. In conjunction with Colonel Holden, a semi-automatic generating set had been designed, and was now under test. The company had also, he said, made arrangements for supplying electric cars, and he anticipated that this would develop into a large business.

**Wireless Electric Light Co.**—Some time ago we announced the incorporation of this company, which, we now learn from the *Financial News*, is to acquire certain British patents from Otto Markiewicz, the British Thomson-Houston Co., Max J. Stoeck, and Richard H. Markiewicz. The purchase consideration is £18,000, payable in £5,000 in cash to the B.T.H. Co., and £13,000 in cash, and £14,500 in shares to the others. J. F. Gilmore, the promoter, is to receive £32,000 in cash and shares in repayment of moneys paid by him on behalf of the company. First directors are E. Wilding, Chartered Accountant, 47 Victoria Street, S.W., J. F. Gilmore (same address), and M. J. Stoeck, 19 St. Dunstan's Hill, E.C.

**Metallic Seamless Tube Co.**—A 20 per cent. dividend is recommended for the past year, carrying forward £2,887.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

## SUMMARY

THE introduction of tungsten lamps in Bristol resulted, in 1909, in an increase of 50 per cent. in the average illumination of consumers' premises, but the cost of a service (exclusive of meter), is £3 8s. for an average revenue of 35s. per annum. (Page 600.)

At the last meeting of the "Point Fives," Mr. C. S. Davidson explained that, owing to the lack of a sales and hire department at Barnes, the introduction of the tariff had not produced such a diversified load as was hoped. (Page 600.)

A CORRESPONDENT refers to a push button emergency motor stopping system recently described in our columns. (Page 600.)

MR. C. VERNIER, in his address as Chairman of the Newcastle Section of the Institution of Electrical Engineers, maintained that the waste gases from coke ovens and blast furnaces would be sufficient for the supply of electricity for the whole of the United Kingdom. He referred to the power companies with municipal shareholders in Germany, and concluded with an interesting review of the overhead line question. (Page 601.)

SOME difference of opinion was expressed at the Institution of Mechanical Engineers on Friday, as to the economy of electrical driving for flour mills. One speaker mentioned a case where the output was increased by 7½ per cent. since the use of electric power was commenced. (Page 602.)

WE give some notes on the work of the late Dr. H. Aron. (Page 602.)

A NEW water-heater, controlled by a thermostat is described. (Page 602.)

AN Electrical Exhibition is now being held at Glasgow, at which most of the leading electrical firms are represented. (Page 603.)

SOME new accessories for the Henley Wiring System are illustrated. (Page 604.)

ADVICE is given in our questions and answers columns regarding the treatment of a dynamo which does not give its correct voltage. (Page 605.)

A NEW table lamp, a form of enclosed fuse, and an electrically driven pump are illustrated on page 606.

HIGH-TENSION D.C. traction is being adopted on the Canadian Northern Railway. (Page 607.)

AN international commission to carry out experiments in wireless telegraphy is being formed. (Page 607.)

AMONG the specifications published by the Patent Office last week was one by H. Leiser for a method of producing tungsten which can be drawn into filaments for incandescent lamps. Opposition has been entered to the grant of a patent to the B. T.-H. Co. for a method of annealing silicon steel. A number of important patents expire during the coming week after a full life. Included is one by H. Bremer, covering the addition of a flux to flaming arc carbons, and one by F. Braun covering the use of a jigger transformer in wireless transmitting circuits. (Page 608.)

A NET profit of £3,477 has been made on the Bradford electric supply undertaking.—New electric supply schemes are under consideration at Coniston, Llanfairfechan, Teignmouth, Waterford, and Whitstable.—The Lytham Council has decided not to take bulk supply from St. Anne's.—An electrical exhibition is in progress at Sheffield.—A strike of wiremen is in progress at Manchester. (Page 609.)

LOANS for extensions are under consideration at Bolton, Leicester, and Salford. Cables are required at Fleetwood, a gas-driven generator at Ormskirk, and stores at Grimsby. (Page 610.)

**Faraday House O.S.A.**—The annual smoking concert of the Faraday House Old Students' Association has been fixed for Friday, December 5th, at the Holborn Restaurant. The President, Mr. Haydn T. Harrison, will occupy the chair.

**Electrical Trades' Benevolent Institution.**—On Saturday, November 22nd, the Garrick Dramatic Society are giving a performance of *The Voyage of Inheritance* at the Royal Court Theatre. Tickets for all parts of the theatre should be obtained from Mr. F. B. O. Hawes (18 Park Mansions, Vauxhall Park, S.W.). Mr. L. G. Tate (20 Bucklersbury, E.C.), or members of the committee of the E.T.B.I., as the arrangement is that the Institution only benefits by the tickets so sold. It is hoped that the receipts may be considerably in advance of last year's, when, it will be remembered, the Garrick Dramatic Society gave a fine performance of *The Second Mrs. Tanqueray*, which was thoroughly enjoyed by a full house.

## ARRANGEMENTS FOR THE WEEK

FRIDAY, OCTOBER 31st.

*Batti-Wallahs' Society.*

7.45 p.m. Smoking concert at Holborn Restaurant.

TUESDAY, NOVEMBER 4th.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At Midland Hotel. Address by the Chairman, Prof. E. W. Marchant. Smoking concert to follow.

*Institution of Civil Engineers.*

8 p.m. Address by the President, Mr. A. G. Lyster.

THURSDAY, NOVEMBER 6th.

*Institution of Electrical Engineers: Yorkshire Section.*

7.15 p.m. At Hotel Metropole, Leeds. Reception and Address by the Chairman, Mr. W. B. Woodhouse. Smoking concert to follow.

## The London Electrical Engineers.

MONDAY, NOVEMBER 3RD.—*A. Company.* Technical Instruction, 7 to 10 p.m.TUESDAY, NOVEMBER 4TH.—*B. Company.* Technical Instruction, 7 to 10 p.m.; Meeting of N.C.O.'s at 8 p.m.WEDNESDAY, NOVEMBER 5TH.—*Recruits only.* Infantry Drill and Technical Instruction, 6 to 10 p.m.; *Sergeants' Mess.*—Meeting in Mess Room at 7.30 p.m.THURSDAY, NOVEMBER 6TH.—*C. Company.* Technical Instruction, 7 to 10 p.m.; Meeting of N.C.O.'s at 7 p.m.FRIDAY, NOVEMBER 7TH.—*D. Company.* Technical Instruction, 7 to 10 p.m.; Meeting of N.C.O.'s at 7 p.m.SATURDAY, NOVEMBER 8TH.—*Headquarters open from 10 a.m. till noon.*

## THE HALF-WATT LAMP PANIC

IF Mr. H. Faraday Proctor had read the articles which I have appeared on the half-watt lamp in *ELECTRICAL ENGINEERING* during the past few weeks, particularly the one published in our issue of October 9th, we should have been deprived of an interesting portion of his Chairman's address to the Western Section of the Institution of Electrical Engineers last Monday. He would have realised that the half-watt lamp cannot displace the  $1\frac{1}{2}$ -watt lamp as rapidly as this has displaced the  $3\frac{1}{2}$  watt per candle. The tungsten lamp appeared on the market in sizes of about 50 c.p., and the only impediment which prevented the immediate production of the smaller sizes was the mechanical difficulty of making finer filaments. The nitrogen-filled half-watt lamp will in the first instance have a minimum candle-power in the neighbourhood of at least 300, and the research work which has led to its evolution has shown that lamps of ordinary domestic candle-powers constructed on the same principle would have a poorer rather than a better efficiency than the one-watt lamp. Nevertheless, Mr. Proctor's data as to the effect of the introduction of the tungsten lamp in Bristol, although unnecessary to allay a half-watt panic, are distinctly interesting.

In 1909 a careful comparison was made of the consumption of electricity by a large number of consumers in Bristol who had installed tungsten lamps throughout their premises, with that of the same consumers when using carbon filament lamps. Care was taken to ascertain that the results were directly comparable. The result showed an economy to the consumer (averaged) of 53.8 per cent. Since, however, the tungsten lamp represents an economy of about 68.5 per cent., it was evident that those consumers on the average had increased the candle-power installed by about 50 per cent. It is further interesting to note that after a lapse of four years, the proportionate figures still hold good. Thus the average consumer has been educated up to require illumination 50 per cent. in excess of that with which he had been satisfied previously.

But Mr. Proctor is still rightly concerned as to the disproportionately high cost of the consumers' service connections in view of the advent of the small consumer, who requires only a few of the more economical lamps on his premises. In Bristol the present cost of connecting premises adjoining the mains is £3 8s. (exclusive of the cost of the meter), and the average revenue per connection—derived from 20 per cent. of the lighting consumers—amounts to only 35s. per annum.

Mr. Proctor's address, which dealt with a variety of other topics, from purely local matters to the proper duties of the Institution, and from the standardisation of 2-pin plugs and catalogue sizes to the Daylight Saving Bill, will probably appear in full in the *Institution Journal* early in December.

**Finsbury Technical College O.S.A. Dinner.**—The Annual Dinner of the Finsbury Technical College Old Students' Association has been fixed for Saturday, November 15th, at the Trocadero Restaurant. Mr. H. A. Humphrey will take the chair, and in addition to the musical programme, intervals to allow members to meet and converse have been arranged. Mr. H. F. Knight (14 Old Queen Street, Westminster, S.W.) will be glad to receive applications for tickets, which are priced at 5s. 6d. each.

## THE "POINT FIVES"

A MEETING of the "Point Fives" was held on Friday, October 17th, at the "B. & K." electric restaurant, when Mr. S. T. Allen (Wolverhampton) and Mr. A. H. Shaw (Ilford) were elected members of the Society. The qualifications necessary for membership were discussed, but it was agreed that no alteration be made in the present arrangements. During the evening a new type of light-weight oven and grill, which was designed by Mr. R. S. Downe, was examined by the members present and favourably commented on. Fifty of these ovens are going through the B. & K. Accessories Co.'s workshops at the present time. In the course of his five-minute address, the Chairman, Mr. C. S. Davidson (Barnes), lamented that, unlike his predecessors in the chair, he could not record any very striking result of his department's increased activities due to the introduction of the point five tariff. This he attributed to the fact that he could not maintain a sales and hire department. Since the introduction at Barnes of the tariff from which the Society took its title, some ten per cent. of his consumers had elected to be charged on the rateable value basis, and he had received innumerable inquiries regarding the hire and purchase of all classes of apparatus. But owing to his inability to hire cookers, the result had been the installation of the cheaper classes of apparatus, such as radiators, in the proportion of about a hundred to one cooker. Thus they were selling cheap units without the anticipated advantage in diversity factor. He urged the Society to assist those local authorities who had not hiring powers to obtain them, and thought that architects should be persuaded to do away with the present unsatisfactory system of fireplaces and substitute modern electric heaters. Thus there would be a saving in the cost of brickwork, registers, space, and decorations.

The address was discussed, and a suggestion for co-operative action in regard to publicity matters made by the Association of Municipal Electrical Engineers (Greater London) was agreed to. These endeavours were, however, only regarded as temporary, and the meeting expressed the opinion that every possible effort should be exercised to bring about a general publicity scheme from the electric supply industry.

The next meeting (Chairman, Mr. A. H. Seabrook) was provisionally fixed for Friday, January 16th, at "Tricity House." After the business meeting at 4 o'clock there is to be a dinner and discussion at 7 o'clock, to which each member may invite one or two guests.

## CORRESPONDENCE

## EMERGENCY SWITCH SYSTEMS.

To the Editor of *ELECTRICAL ENGINEERING*.

DEAR SIR,—In reference to the description of an emergency push switch system in your issue of 23rd October, 1913, it may interest your readers to know that the method of first short-circuiting the "no-voltage" coil of a starter and then opening the coil circuit was originated by me and a colleague at least a dozen years ago, and it was successfully used at the time. I presume that the patent refers to details of the switch.

The difficulty of reliably releasing the "no-voltage" coil of starters, when operated on the shunt field circuit, particularly with large motors, is a very real one, and I have known seven-strand cables of substantial section to be run to the stop switch for this purpose with indifferent success.

A better method which I devised is to arrange the "no-voltage" circuit as an independent shunt or lamp circuit, with the coil wound to about, say, 20 per cent. of the total voltage. Small wires can then be run any reasonable distance to the push switch for the purpose of short-circuiting the coil, and in many years' experience of this method I have never known it to fail. This method has now become the regular practice with some well-known firms.

I may add that the term "no-voltage release" is generally misconstrued. Originally it was intended to release the starter in the event of supply interruption, which was prevalent in early days, but the usual manner in which it is carried out, together with the present-day constancy of supply, has led to the assumption that it is primarily intended as a protection to the field excitation.

The original interpretation seems to allow wider scope for the correct solution of reliable emergency switch systems, and also provides more complete compliance with modern specifications and regulations.

I am, yours faithfully,

ARTHUR E. GOTT.

Southall,

25th October, 1913.

## WASTE

"WASTE" may be taken as the keynote of Mr. C. Vernier's address last week as Chairman of the Newcastle Section of the Institution of Electrical Engineers: waste by the continued employment of comparatively small electricity works with small load factors; waste of the opportunity of remedying this in the case of electric power for railways; waste heat and waste gases from coke ovens and blast furnaces which would be sufficient to supply the whole demand for electrical energy in the United Kingdom; waste of capital on underground mains owing to the difficulties of obtaining overhead wayleaves; and waste of good dielectric by giving a thicker insulation than necessary to extra high-tension cables.

Mr. Vernier produced some startling statistics. During the past ten years the supply of electricity by power companies on the north-east coast of England has increased by over 3,200 per cent.; but an increase of 450 per cent. is the average increase for the whole country for the same period. Less than three per cent. of our electrical undertakings have a load factor of 25 per cent., and less than two per cent. have a works' cost as low as 0.5d. per unit sold. According to the last Census of Production, in 1907, 10½ million h.p. were employed in the factories and mines of this country, but the total plant capacity of the public electricity undertakings was only 1½ million h.p. (which has increased only by about ½ million since that date). Private electric plants in 1907 were responsible for about 1 million h.p., that is to say, actually two-thirds the total of the public supply undertakings. In supplying electrical energy to work our railways, we must not, he said, add to our already too numerous generating stations by compelling the railway companies to erect their own; the electricity supply industry must be ready, for the ability to supply will create the demand.

Mr. Vernier urged that further steps should be taken in the direction of turning all coal-fired generating plants into large power stations, interconnected as far as possible, and that all available sources of waste heat should be utilised. He estimated that if 80 per cent. of the waste heat in the gases from blast furnaces and coke ovens were employed, it would supply 1 million h.p. continuously, approximately equally contributed to by the two sources; but he pointed out that the share contributed by the coke ovens would under present conditions have to be discounted by 75 to 80 per cent., as the majority are of a type which does not allow any recovery of the waste gas to be made.

Germany is at present wrestling with this problem of the centralisation of power generation, and is putting down large stations for supply in bulk, many of them in connection with iron and coal companies, utilising waste heat from coke ovens and unsaleable qualities of fuel. But there a step far in advance of us has been taken. The co-operation of municipal authorities is being secured in some cases by buying out municipal undertakings upon terms advantageous to both sides, but more usually by giving these municipalities a financial interest in the power company. It may be remembered that this policy was referred to by Dr. Ferranti in the course of a speech which created some sensation at the I.M.E.A. annual dinner last year (*ELECTRICAL ENGINEERING*, Vol. VIII., p. 369). An instance quoted by Mr. Vernier was the municipality of Strasburg, which takes the whole of its supply from a power company, in which it owns a large number of shares, and from which also some seventy communes in Alsace-Lorraine are also supplied. As the result of the operations in 1909, the municipality received dividends and a share in the profits amounting approximately to £38,000, which, after deducting 4 per cent. interest on its invested capital, left a balance of over £21,000 for the relief of rates. In other instances, groups of urban and rural authorities co-operating with a power company have the option of subscribing for 40 or 50 per cent. of the total capital of the company in ordinary shares or even in some cases, in preferential shares, with a fixed dividend and a further share in the profits. In either case, the municipalities are directly represented on the Board.

It is perhaps in the United States of America, however, said Mr. Vernier, that the centralisation of electric power production and distribution is making the greatest progress, and it is also remarkable that in that country the supply of electrical energy is chiefly in the hands of private enterprise. We have nothing to compare with the electric service in Chicago, with its maximum load of 230,000 kw. (which compares with 20,000 kw. ten years ago), or with more urban supplies, such as the Public Service Corporation of Northern Illinois,

supplying 46,000 consumers in 150 communities, whose combined population is only one-half million distributed over a tract 150 miles long, and working on a system load-factor approaching 70 per cent. Another example is the Central Illinois Public Service Company, which is gathering into one system a rural district of 350 miles radius (larger than the United Kingdom), with a population of only a quarter of a million, whose present ninety local generating stations will shortly be replaced by a small group of modern central stations.

American progress brought Mr. Vernier to a subject upon which many power company distributing engineers have strong opinions, namely, the difficulties which are placed in the way of overhead mains in this country. Without overhead mains such results as those in Illinois would have been impossible. Here, the only case in which overhead mains have been very widely employed has been in the North-East of England, where there are already 170 miles of such transmission lines, chiefly running at 20,000 volts. Mr. Vernier was therefore able to speak authoritatively on the difficulties in connection with these, as he has successfully overcome them to a large extent. The chief trouble is to obtain way leaves, and he envies the position in Italy and Switzerland, where it is possible to acquire them compulsorily. He despaired, however, of a similar state of affairs being possible in this country for some time to come, as even the Post Office experiences great difficulties in this direction. He attributed his success in the North to the fact that the interests of landowners there are largely bound up with the industries, whose needs the power companies supply, and that they are already well accustomed to way leave matters in connection with the mining industry. Moreover, statutory companies are in a better position in this respect than those working under the Electric Lighting Acts, as they have not to obtain the consent of the local authority before erecting overhead lines. Mr. Vernier's reading of the Electric Lighting Acts is that this veto applies not only to public streets, but also to overhead wires erected entirely on private land.

The subject of overhead lines led Mr. Vernier into interesting matters of a more technical character. He put in a plea for a higher standard of design and workmanship than is common on our overhead line work. A great deal of the prejudice which exists against overhead wires, he maintained, arises out of the haphazard fashion in which much of it is only too frequently put up: crooked poles, neither set plumb nor in line, wires run with all sorts of twists and angles, and ugly cross-arms. Good overhead line work, he said, is entirely a matter of minute attention to details of design and construction. The use of overhead mains, he explained, not only resulted in considerable saving in route length, but even, length for length, the capital cost of a first-class 20,000-volt overhead line was only approximately one-half that of a similar 20,000-volt underground cable; while if the pressure were raised to, say, 60,000 volts, at which pressure the use of three-core three-phase underground cables would no longer be possible, the capital cost per kw. would only be from one-fifth to one-sixth that of a 20,000-volt underground cable of equal section. The chief obstacle at present in the way of the adoption of higher pressures is, he said, the heavy cost of switchgear, as the average distance between switching points is small in this country. A further consideration is the practical impossibility of erecting an entirely continuous overhead system. This led to an examination of the high voltage cable position, and Mr. Vernier mentioned that no very notable advance in this respect could be recorded since the laying of the extensive 20,000-volt three-phase cable system in his district some seven years ago, except a large system of 30,000-volt three-phase cables laid in Berlin about two years ago (see *ELECTRICAL ENGINEERING*, Sept. 11th, 1913, p. 513), and some short lengths of 45,000-volt three-core three-phase cables in use in France. He could not foresee any possibility of exceeding these pressures for long lengths of cable on account of the heavy capacity currents and increased dielectric losses, which increase in proportion to the square of the voltage in cables, but are practically non-existent on overhead lines up to the limit of pressure at which corona effects take place. On the other hand, he saw no very obvious difficulty in constructing single-core lead-sheathed cables for three-phase working up to a working pressure of 80,000 volts between phases, i.e., nearly 50,000 volts per cable with the neutral point earthed, for comparatively short lengths used as an adjunct to overhead lines. He deplored, however, the still very incomplete knowledge of the science of cable design, and contended that the thick-

nesses of insulation required for E.H.T. cables was in many cases unduly liberal and purely arbitrary. For instance, although the potential stresses are relatively greater for a small core than for a larger one, and for a "clover-leaf" than for a round conductor, yet our engineering standards demand thicker insulation on the larger sizes of cables, and permit the same thickness for cables of round and clover-leaf section.

We have reviewed the main points of Mr. Vernier's most interesting address; the full text of it will appear in the *Journal* of the Institution of Electrical Engineers early in December.

### ELECTRICAL DRIVING OF FLOUR MILLS

IN the course of a Paper on "Modern Flour-Mill Machinery" at the Institution of Mechanical Engineers on Friday, the author, Mr. R. B. Creak, said that although electric driving of flour mills was making some headway, it had been demonstrated that current must be obtained at about 0.4d. per unit before it could compete successfully with steam. Flour mills offered no field for individual driving, as the machines must run together as a complete plant. The usual plan was to put down a motor for driving the wheat-preparing plant, one for driving the roller-shafts on the bottom floor, and one for driving the upstairs line-shafting. There were about a dozen flour-mills driven by electric power at present in this country, and these reported very favourably on the system. Greater regularity of speed is one of the claims made for electric driving, and this was a matter of very great importance where so many separations were effected by the use of delicately adjusted air-currents.

There was some difference of opinion in the discussion on the question of electric driving. The President (Sir H. F. Donaldson, K.C.B.) asked whether the author, in arriving at his figure of 0.4d. per unit, had credited the electric drive with the saving in land, compared with steam, through the absence of the boiler-house and chimney, and also the various other savings in other ways. Mr. C. J. Robinson declared solidly for the electric drive, and mentioned the case of a mill where not only was the output  $7\frac{1}{2}$  per cent. more than with steam, but the product was finer owing to the delicacy of adjustment of the air currents and the uniformity of power to be obtained with electric power.

Mr. Horace Boot, on the other hand, disagreed that electric driving was the best, although he would like to agree. He had had recently to go into the question very carefully for a large mill, and, comparing an up-to-date steam equipment with "Uni-flow" engine, superheaters, and high-pressure boilers, he calculated that electric power must be supplied at 0.33d. per unit to compete. The capital charges for an electric power plant at the mill were £7,000, and the running costs £3,800 per annum, against capital charges of £2,704 and running charges of £6,000 per annum if power was purchased at  $\frac{1}{4}$ d. per unit. For steam plant the figures were £5,890 and £3,393 respectively.

In his reply the author said that his figure of 0.4d. per unit did not include any advantage in respect of the saving in land, but it included capital costs, depreciation, and repairs maintenance. He believed that there were situations, such as London, where land was dear, where the electric drive was the only thing; but where land was cheap, steam would be the cheapest. He confessed his surprise that a  $7\frac{1}{2}$  per cent. saving had been obtained in an electrically driven mill.

### THE LATE DR. ARON

WE have received from the General Electric Co., Ltd. (67 Queen Victoria Street), an interesting biographical sketch of Dr. Hermann Aron, whose sudden death on August 29th at Homburg was recorded in *ELECTRICAL ENGINEERING*, September 11th, page 512, written by some engineers who were connected with him during his life's work.

Dr. Aron's work on electrical measurement dates from as early as 1884, when electric light and power production was in its infancy, and the electrolytic meter of Edison was the only practical supply meter in existence. In searching to improve upon this, Aron conceived the happy thought of influencing the swing of the pendulum of a clock by the passage of an electric current, and of basing his calculation of the consumption of energy upon the acceleration of this clock, compared with one not so affected. The state of electrical measurements was at that time very primitive, and the only instrument available to check his meters was the copper voltmeter. There were many difficulties to overcome, but after a comparatively short time he succeeded in manufacturing serviceable meters, which in 1885 were adopted by the Berlin Electricity Works. He occupied himself for nearly 30 years in improving his clock meter, which is still to-day one of the most accurate in existence, and producing special patterns such as two-rate and maximum-demand meters. The second invention by which his name is well-known is the two-watt-meter method of polyphase power measurement, which he developed and patented in the very early days of three-phase work, and when, later, polyphase circuits were constructed with a neutral conductor, he again succeeded in evolving a formula which con-

siderably simplified the meter required for the measurement of power in such a circuit. With the spread of alternating-current work Aron engaged in the construction of motor meters on the Ferraris principle on a large scale, and this was followed by the production of direct-current motor meters. His activities, however, ranged over a considerable field of physico and electrical engineering. He studied in the Universities of Berlin and Heidelberg, assisted Prof. Paalzow in the physical laboratory at Charlottenburg, and lectured both at the Military Technical Academy and the University at Berlin on chemistry and physics. The subjects of his published papers include the elastic quality of crystals, the theory of condensers, the microphone, the influence of atmospheric electricity on cables, and secondary batteries. As far back as 1883 he spoke on wireless electric signalling at Vienna, and he was a regular writer in the *Electrotechnische Zeitschrift* on meters and other subjects. He also frequently wrote on patent and industrial law. His activities as a manufacturer extended to electric clocks, gas and slot meters, taximeters, &c., and he also at one time started the manufacture of insulated copper wire in order to procure suitable wire for his meters. He took great interest in the affairs of the Institution of German Electrical Engineers, and will be remembered by all who came in contact with him as a man of personal charm, inflexible integrity, and extraordinary intellectual acuteness.

### THE LOSLES ELECTRIC WATER HEATER

WE have received from Mr. C. Wilkinson (Beech Mount, Harrogate) some further particulars of the latest form of the Losles automatic electric water heater which he introduced not long ago. The principal feature of this apparatus is that it takes a small current for a long period, forming a very favourable load from the load-factor point of view, and contains a thermostat by which the current is cut off when the desired maximum temperature has been reached, avoiding losses due to the boiling away of the water. Its construction, with ample heat insulation and no metallic connection between the inner water chamber carrying the heating elements and the outer vessel, renders the heat loss almost non-existent—a point of very great importance in a heater taking small amounts of energy for a long time. These heaters have been made up to 40 gallons capacity, but the standard size is for 12 gallons, and is 36 in. in height and 12 in. diameter. There are two heating elements, each controlled by the thermostat, and each taking 500 watts. The thermostat acts on quick make-and-break switches of reliable construction. It can be set to cut off as high as 200° F., but is usually arranged to furnish water at from 160° to 180° F. With one heating element in action, about 24 gallons of hot water can be obtained per twenty-four hours, and when the second heater is switched in, the rate of heating and output of hot water is doubled. One heater may be connected direct to the service outside the meter and current supplied at a contract rate, while the other, the intermittent supply to which is more of the nature of a peak load, may be supplied from the house circuit in the ordinary way.

**Explosion in New York Generating Station.**—It is reported that as a result of an explosion which occurred in the Staten Island generating station on October 22nd, a large part of New York was put in darkness, while the supply of power to the railways and tramways also failed. Eight persons were killed.

**Damaging a Cable.**—An action was recently brought by the Glasgow Corporation against Robert Murdoch & Sons for damage to a cable, belonging to the Tramways Department, while taking a water-supply pipe underneath the cable duct. The Corporation would not allow Robert Murdoch & Sons to open up the pathway, and while they were tunnelling to locate the cable it was damaged by a pinch bar. As inspectors from the Tramways and Works Departments were present at the time and approved what was being done, the action failed.

**Electric Propulsion of Ships.**—Mr. A. Gracie's "James Forrest" lecture on "Twenty Years' Progress in Marine Construction," delivered last Thursday at the Institution of Civil Engineers, only dealt very briefly with electrical matters. Electrical transmission, he remarked, had now been applied to several vessels. Alternative schemes had been tried in which the power was generated by steam turbo-generators, and by the Diesel oil-engines, and applied to the propeller by alternating-current motors. Considering the transmission efficiencies likely to be attained and the increased weight and initial cost of the installation, he was not of opinion that a system of this kind could compete successfully, in ordinary cases, with the direct-driving engine or mechanically geared turbine. Where, however, power has to be provided for other than propelling purposes (in which case the same generating plant could be available), it was possible that this system would have advantages.

## THE GLASGOW ELECTRICAL EXHIBITION

**E**NCOURAGED by the success attained by recent Smoke Abatement Exhibitions in Glasgow, the Corporation jointly with the British Electrical and Allied Manufacturers' Association, have promoted a purely Electrical Exhibition, which was opened in the Zoo Buildings, New City Road, on October 23rd, by the Countess of Glasgow. It will be continued till November 15th, and will be open each day from 11 a.m. till 10 p.m. The Exhibition embraces electrical machinery and appliances of every description, but particularly as regards the applications of electricity to daily requirements in the home and in the workshop. The Exhibition should be successful in achieving the two-fold object of the promoters in emphasising the economical and labour-saving qualities of the many electrical devices now available for domestic and commercial use, and by their more extended use further the air purification crusade. Under the management of Mr. James M. Freer, who has been responsible for many similar undertakings, the success of the exhibition may be said to be assured, and so far the daily attendance of never less than 4,500 indicates the interest taken in the venture by the general public. A pleasing feature, unusual in this country, is the uniform scheme of decoration of the stands, in grey and pink. There are 80 stands, occupied by about 70 exhibitors.

The Glasgow Electricity Department have on their stand an information bureau, where officials are in attendance to give particulars relative to the supply of electricity for lighting, heating, cooking, and power purposes. A map showing the position of existing mains is exhibited, and terms can be quoted for extensions to premises where a supply is not at present available. Further information may be obtained by referring to the several pamphlets which are here distributed, including descriptions of the methods of charging and approximate annual costs, and series of articles in booklet form by the Kilowatt Publishing Company and others. A shop window of ordinary dimensions is shown lighted by different systems suitable for various trades, with heaters and fans for the dissipation of frost and moisture on the windows, and these combinations are each demonstrated at intervals by an automatic switch, the cost of installing the respective equipments and the annual charge being also indicated. Two radiators are on view, a "Belling" fire with folding down top rack, which may be used for a kettle or such like, and a lamp radiator with decorative screen or canopy.

Simplex Conduits, Ltd. (72A Waterloo Street, Glasgow), show a number of wiring accessories and heating and power accessories, including the "Plexsim" oven. Cooking demonstrations are given by an attendant cook, who claims to roast a 7 lb. joint in 2 hours 20 minutes with a consumption of 1 unit. In the construction of this oven, heat losses are avoided when open for inspection, and owing to the position of the heating elements the cooking temperature is reached within 5 minutes of switching on the current, and the heat is then continuously circulated around the food being cooked, which is thus kept at a uniform temperature. Two types of portable fan vacuum cleaners are shown, the larger being fitted with rollers and brush, and on sale for £8 10s. A sealing-wax heater has a special arrangement for regulating the flow of heated wax. The selection of electric light fittings includes several of the semi-indirect pattern with alabaster, intaglio and alabaster glass basins.

The Siemens firms (66 Waterloo Street, Glasgow) have quite a varied collection of apparatus on view on Stands 18 and 19, including a 10 b.h.p. Aster-Siemens direct-coupled generating set suitable for use with petrol or paraffin fuel, and the well-known "Melda" domestic water-pumping equipments supplying a fountain on the stand. The "Stannos" system of wiring for both concentric and double use is shown with relative fittings connected up on the surface of show boards. As already well known, the small diameter of the "Stannos" conductors makes it specially suitable for exposed use, whilst a considerable saving can be effected by adopting it on the concentric system. Owing to the limits of space, only a small number of motors, electric drills, &c., and switch panels are exhibited, including two A.C. loom motors for individual and belt drives. There are a special show of laboratory and tantalum dental instruments, also ebonite accessories and tools, and a comprehensive selection of telephones for general service, with the firm's latest gas- and water-tight types suitable for mines, with a mine-shaft signalling outfit operated at different levels by push or pull attachments. Specimens of different classes of cable suitable for bell, lighting, power, submarine, and telephone work are displayed. The temperature-recording apparatus for cold-storage plants, water meters and pyrometers of both optical and furnace types, and the recording and dial indicator fire alarm apparatus, are all of

interest as representative of the comprehensive range of manufactures supplied by the firm.

Ferranti, Ltd. (Central House, Kingsway, W.C.), have an interesting exhibit on Stand 21, where they have a 200 k.v.a., 6,000/210-volt totally enclosed three-phase oil-immersed transformer, with the case removed to show coils and workmanship. Besides an assortment of meters and switches, there are two ovens and boiling plates, which have interchangeable elements guaranteed for two years, of very substantial construction, and very suitable to withstand ordinary kitchen usage. The feature of this exhibit is a water heater for domestic purposes. It is this duty that often precludes the more general use of electric cooking, as the kitchen range or separate slow combustion boiler must otherwise be always retained to provide the necessary supply of hot water throughout the house. The Ferranti water heater operates on the thermal storage system, taking a constant load, depending on the amount of hot water required in each household. The ordinary size for domestic use takes 300 watts continuously, and gives a supply of 40 gallons in 24 hours at 120° F. In the event of all the hot water being drawn off from the receiver at any time, it is not necessary to wait till the whole bulk is heated, as after one hour about 2 gallons is available at 110° F., and this quantity is gradually increased.

No. 45 Stand, of Kelvin, Bottomley and Baird, Ltd. (16-20 Cambridge Street, Glasgow), is one of the first noticed by the visitor on entering the exhibition. For some time this firm, formerly well known as Kelvin and James White, have made a speciality of exhibiting in their Cambridge Street showroom an assortment of heating and cooking appliances of their own and other firms' manufacture. Many of these are of the "universal voltage" type, and are therefore very convenient, as they are suitable for connection to any supply. The selection at the exhibition, which is most comprehensive, includes an electric radiator for bathroom use in cupboard form, and a heater of bulkhead form for warming cabins on board ship.

One of the brightest displays is exhibited by the Edison & Swan United Electric Light Co., Ltd. (153 West George Street, Glasgow). Amongst the principal manufactures of this company on view at Stands Nos. 29 and 30, special importance attaches to the Royal Ediswan wire-drawn Lamp. The half-watt lamps, of 1,250 and 2,000 candle-power each, are shown alight, and constitute a source of interest to the visitors. There are also accessories manufactured at Ponders End, which include many patterns of lamp holders, adapters, ceiling roses, plugs, fuses, and a popular house service iron-clad switch. There is a fine selection of fittings for ship, mill, and colliery use, and these include pendants, oyster, bulkhead, and watertight fittings, also specimens of hand lamps, including the Home Office pattern. Amongst other exhibits to which attention might be drawn are the convertible fans, which may be used as a table, desk, or bracket fan, and owing to its simple conversion it is proving most popular. Specimens are shown of Ediswan heavy service switchgear, including the "W" and "E" types of circuit breaker for 1,000 and 2,000 amperes. Inside the stand offices may be seen an Ediswan main switch and distribution board in use for the stand lighting. Many patterns of Ediswan heaters (Bastian and Dowsing patents), including the "Royal" heater, are on view.

On Stand No. 32 the "Hestia" automatically controlled electric heating and ventilating system is shown by A. Schonfield and Co. (21 Hope Street, Glasgow). In this system a predetermined temperature can be obtained within a mean variation of  $\frac{1}{2}^{\circ}$  C. by this firm's patent thermostat outfit. The "Hestia" stove, which heats a room as a convector, is a welcome innovation on quite novel lines, and as a flat, perforated grating is fitted on the top it is very convenient to warm household articles or act as a hot plate.

**Electricity in Agriculture.**—The Journal of the Board of Agriculture and Fisheries for October contains a long communication from Prof. J. H. Priestley, of Leeds University, upon the further experiments he has been carrying out on the application of electricity to improve crop production, with the aid of a grant placed at his disposal by the Board. He has been proceeding systematically, and two of his results are of considerable interest. He found that with the usual arrangement of wires the current passing to the plant was extremely small; the ordinary atmospheric discharge was increased from about  $10^{-16}$  ampere per sq. cm. to  $10^{-12}$  or  $10^{-11}$  ampere per sq. cm. The other important observation was that a slight wind had the effect of increasing the area of discharge considerably, and that probably in all cases of experiments made hitherto, the "control" area was also "electrified" to some extent. In view of the exceedingly small currents observed, it would be interesting if Prof. Priestley were now to conduct some experiments (which could easily be carried out in houses, so as to eliminate the action of the wind) with wires charged at a much lower potential and much nearer to the plants. Currents of the same magnitude could easily be obtained in this manner, and the observations would then determine once for all whether the stimulating effect on the plant is really due to the current or is due to the formation of nitrogen compounds in the air above the plant due to the discharge from the high-tension wires.

## THE HENLEY WIRING SYSTEM

A NEW list of materials for the Henley wiring system, which is being issued by W. T. Henley's Telegraph Works Co., Ltd., contains one or two new accessories. The system was originally described in *ELECTRICAL ENGINEERING*, September 28th, 1911, Special Exhibition Supplement, page 31, and employs specially sheathed cable, which can be

FIG. 1.—UNIVERSAL BONDING CLAMP.

used without casing or tubing. One of the novelties is the bonding clamp shown in Fig. 1 which has been designed so that one clamp only instead of several may be used at any point, thereby reducing to a minimum the necessity for stocking several sizes of the original pattern. A new form

FIG. 2.—TEE BOX FOR TWIN SYSTEM.

of tee and joint-box for the twin system is shown in Fig. 2 connected up for a switch circuit. These boxes are manufactured from brass heavily tinned, and the internal connectors are of the porcelain type. The continuity of the metal sheathing of the cables is preserved by means of mechanical bonds that clamp the lugs on the boxes to the cables. The series of accessories listed is very complete, and the list contains some useful instruction for wiring on the Henley system, as well as views of buildings wired by this method, which give a good idea of the large extent to which the system has been adopted.

## CATALOGUES, PAMPHLETS, &c., RECEIVED

**METAL FILAMENT LAMPS.**—Pope's Electric Lamp Co., Ltd., have produced a series of artistic, and in some cases humorous, coloured post-cards calling attention to their Elasta wire lamps, and are prepared to supply these over-printed with customers' names to any firms who have not yet received a supply.

**ALUMINIUM.**—A leaflet from the British Aluminium Co., Ltd. (109 Queen Victoria Street, E.C.), illustrates various applications of aluminium to motor-car construction.

**BATTERIES.**—We have received two new illustrated leaflets from the Chloride Electrical Storage Co., Ltd. (Clifton Junction, Manchester). One of these deals generally with the manufacture of the Chloride accumulator and its leading features, while the other is devoted to new types of the "Plantide" cell with special reference to country-house lighting.

**TIME RECORDERS.**—We have received a booklet from the Gledhill-Brook Time Recorders, Ltd. (43 Market Street, Huddersfield), describing in some detail their system of time recording and cost keeping, which is extensively adopted in large factories.

**ACCESSORIES.** The Metallic Seamless Tube Co., Ltd. (Meta House, Corporation Street, Birmingham), send us a card

illustrating a few examples of their standardised series of "metallic" accessories.

**MOIST-HEAT RADIATORS.**—Leaflets from the Altheat Co., Ltd. (62 Oxford Street, W.), deal with the moist-heat radiator which was shown at the recent "Ideal Home" Exhibition (*ELECTRICAL ENGINEERING*, Oct. 16th, p. 581). It will be remembered that carbon filament heating lamps are used behind specially treated metal louvres, so that a cheerful red appearance, suggestive of warmth, is given, while the heat waves are caused to take up moisture from a water reservoir before they are radiated from the stove.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**BELLS, INDICATORS, AND TELEPHONES.**—We have received from the International Electric Co., Ltd. (111-115 Salisbury Road, Kilburn, N.W.), the bell, indicator, and telephone sections of its new catalogue (1913 edition) now in course of preparation. A very wide range of bells is covered, from the cheap trembler type to gas- and water-tight bells for mines, shipyards, and other places where reliability under rough usage is essential. Included also are magneto bells, sirens, and hooters for indoor, outdoor, and vehicular purposes. No less complete is the section dealing with indicators, while the telephone section gives particulars of domestic, naval, C.B., magneto, and intercommunication instruments. Strong magneto type telephones for railways, including one of a patented loud-speaking selective-ringing type, and some for use in mines, are also listed. A pocket-size list also deals with the "Talkyphone" for connection to existing bell installations. These instruments are made in several varieties of both table and wall types.

## A STRIKING POSTER

WE give an illustration below of the striking new poster recently introduced by the Edison & Swan United

Electric Light Co., Ltd., to which we referred in *ELECTRICAL ENGINEERING*, October 23rd, page 598.

**Osram Lamp Patents.**—On Friday last the Osram Lamp Works applied to Mr. Justice Joyce for an injunction to restrain the Ostra Light Co. from selling lamps infringing Osram patents. The Ostra Co., however, said that all the lamps sold by them bore their mark, and the lamps produced by the Osram Lamp Works in support of the injunction did not. They thought, therefore, that there had been some mistake, and as they were indemnified by the vendor of the lamps, they wanted an opportunity of seeing them. They therefore asked that the lamps be kept in the custody of the Court. Finally Mr. Justice Joyce said that unless the parties could agree on some place for the deposit of the lamps in which they could be seen by both sides, he would order them to be brought into Court. Meantime the matter stood over for a week.

On Tuesday last Mr. Justice Joyce had before him a motion for judgment in a similar action to the above by the Osram Lamp Works against the London and Provincial Electric Lamp Co. It was stated that the latter company had disappeared entirely since the injunction. Judgment in default of defence was given as asked, and the question of the costs of the inquiry as to damages was reserved.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,362.

How is the reduction in power calculated on internal combustion engines where they are required to work in places of high altitude? A paraffin engine has to work on a high flash point oil, namely, 110, and is required to develop 30 B.H.P. at an altitude of 2,000 ft. above sea-level. Can this requirement be obtained from the ordinary engine by any simple means?—W. A. E. M.

(Replies must be received not later than first post, Nov. 6th.)

### ANSWERS TO No. 1,360.

I have recently come into possession of a dynamo rated at 19 amps. 110 volts 1,400 r.p.m., but find that I cannot get more than 60 volts at this speed, 88 at 1,580 r.p.m., or 92 at 1,620 r.p.m. The armature is ring-wound, and the connections, &c., appear to be in good order. There is no sparking, but the armature and the bearings at the commutator end get rather hot. Is it advisable to run the machine at a still higher speed to obtain 100 volts, or would it be preferable to use lamps of lower voltage, if no method can be suggested to make the machine give the correct voltage at the right speed; and in this case what ampere capacity should be expected from the machine? It should be mentioned that the armature was recently re-wound, and it is possible that some error may have been made. What would be a fair cost for re-winding correctly if this is so?—"SMALLMAN."

The first award (10s.) is made to L. C. for the following reply:—

By the fact that the dynamo is rated 19 amp., 110 volts, 1,400 r.p.m., and that it now refuses to give more than 60 volts at that speed, it is certain that one of two things has happened, viz.: (a) that the field strength is less for a certain current than it was originally, or that (b) the effective number of turns in series on the armature is less than that originally. The case (a) is very improbable, at least to affect the voltage to such an extent. The case (b), especially since the armature has been rewound recently, is far more likely to be the cause of the trouble. As the armature heats up, it points to either shorts or incorrect connecting of the wires at the commutator. It is advisable for "Smallman" to do a little simple testing, provided he has either a milli-voltmeter or a moving-coil ammeter, half-a-dozen lamp fittings and lamps, and a source of electric supply of constant pressure. He should take out the armature and place in V blocks on a table, wire up the lamp fittings in parallel, and join in series with the armature, as in Fig. 1. Place one lamp in the holder, and notice the deflection obtained from any two adjacent segments of the commutator. If the reading is not about 75 per cent. of full-scale deflection, add lamps until it is obtained. If the deflection is too high, close the contacts of main circuit nearer together on opposite side to the segments where preliminary test is made, as in Fig. 2. Mark the segments which give readings different from the average; if too high, examine the soldered connection to commutator for bad joints; if too low, look for shorts, particularly at the ends of the core, where the wire is drawn tightest, or for too few turns in the coil. As the armature is ring-wound, the start should be in one bar and the finish in the next. Either all finishes are left hand of their starts or all right hand. Another point which should not be overlooked is the spacing of the brush gear; the brushes should bear exactly on the half of the

commutator for a two-pole and on the quarter for four-pole. Also the brush rocker should be moved whilst the dynamo is running with a voltmeter across the brushes to see that the position for maximum volts is obtained. If rewound with the tails of the coils in a different position from the original, the brushes will also have to be moved relatively. If each of the foregoing have been tried and found correct, it is possible that the armature has been rewound with too few turns in each coil, but as it is stated the armature gets hot, the trouble is almost sure to be wrong connections or shorts. If this, however, should not be the case, according to the figures relating to the speed and voltage (see Fig. 3), the poles are not nearly saturated, and would give a proportionate increase of magnetism with an increase of ampere turns. This could be accomplished by re-winding the field coil or coils with larger section wire and an increased number of turns. This, of course, depends on the room available. It is not advisable to run the machine at the increased speed to obtain normal voltage until the heating of the armature is done away with; neither should the lower voltage lamps be used, because, although the voltage is reduced,

Fig. 1.

Fig. 2.

the current-carrying capacity of the armature is unaltered, and therefore the output of the machine would alter with the voltage, i.e., from 110 to 60 volts, or nearly 50 per cent. less than original output. To have the armature rewound by an electrical manufacturing company it would cost approximately £2, but if "Smallman" could get in touch with an armature winder he would probably get it done for a quarter of this sum. The heating of bearing is a mechanical defect. It should be taken out, scraped, and the oil grooves cleaned, and if slotted for rings it should be seen that the rings rotate and pick up the oil from the well.

The second award (5s.) is made to W. H., who writes as follows:—

It would appear from the figures given that the armature is incorrectly wound, the probability being that a wrong winding pitch has been used. It may be, however, that some of the coils are short-circuited, especially as the armature gets hot, even though not fully loaded. The best way to find out whether the armature coils are short-circuited would be to separately excite the fields and run the armature on open circuit; if any particular coils show signs of heating, these should then be replaced. If no local heating takes place, the probability is that the armature, as stated above, has been wrongly wound. In either case, it is not advisable to run the machine up to such a speed as would be required to generate 110 volts (about 2,000 r.p.m.), as the defective coils may be burnt out if present, and if the armature is wrongly connected up it should most certainly be rewound. Neither would it be advisable to use lamps of a lower voltage, as there is obviously something wrong with the generator. No mention has been made of the field coils, so it is presumed that these are quite satisfactory. An easy way to test for a partially short-circuited field coil (which may be the cause of the trouble) is to test for stray magnetism at the end of the armature shaft while the machine is running and fully excited. Or, if possible, take the resistance of each field spool as a further check. If the trouble is in the armature, an approximate charge for rewinding the armature of the machine would be £5 or £6; this may seem rather a high figure, but it must be remembered that there will be no data available, and all connections will require to be checked very carefully; also it is, of course, a ring-wound machine, which necessitates hand-winding, and does not allow of the use of form-wound coils.

## GLASS TABLE LAMPS

AMONGST the many improved lighting appliances, for the development of which the British Thomson-Houston Co. (Mazda House, 77 Upper Thames Street, E.C.) have recently been responsible, possibly one of the most novel and interesting is the "Fostoria" table lamp, made entirely of white or tinted glass moulded into quaint shapes and etched with charming designs. Both the pedestal and the dome or reflector of the "Fostoria" table standard are made of glass. Beautiful effects are obtained by using, in the case

FOSTORIA TABLE LAMP OF WHITE VELURIA GLASSWARE.

of three out of the four available types, a small lamp in the pedestal as well as under the dome. The glass of which these table standards is made has wonderful diffusive qualities, so that when both Mazda lamps are alight, the whole of the standard radiates a soft, uniform brilliance. Of course, the greater part of the light from the lamps is reflected downwards on to the table. These table standards are an agreeable change from the metal standard and silk shade convention, which has been rigidly observed since oil-lamp days.

## ENCLOSED FUSES

SOME new patterns of enclosed fuses have recently been added to the large number of substantial construction previously stocked by Simplex Conduits, Ltd. (Garrison Lane, Birmingham). One of these new arrivals is here illustrated. It is designed to take the place of ordinary porcelain fuse

SIMPLEX ENCLOSED FUSE (FULL SIZE).

carriers on standard distribution boards, having a 2½-in. break. Among the other types included in the new catalogue may be mentioned a rewirable pattern and a range manufactured by the company in accordance with the National Electric Code of America.

## A PORTABLE WINE PUMP

THE India Rubber, Gutta-Percha & Telegraph Works Co., Ltd. (Silvertown, E.), has designed a portable electrically-driven wine pump, which is here illustrated. The pump body and plunger are of gunmetal, and the air vessel of copper. A relief valve, fitted with a by-pass to prevent damage to the pump in case of any stoppage in the delivery pipe, is provided. The pump capacity is 12,000 litres per hour (2,640 gallons per hour), against a head of 35 feet. The "Silvertown" 2-b.h.p. motor used runs at 1,000 r.p.m. and drives through machine-cut spur gear. The total weight of the set complete with motor starter is 5½ cwt., and is balanced on the trolley so that this can be easily moved by

PORTABLE ELECTRICALLY-DRIVEN WINE PUMP.

one man and yet be quite stable in use. Though this set was designed for dealing with grape juice containing husks and pulp, it can, of course, be used for other liquids, and the motor can be supplied for D.-C. or A.-C. circuits of any standard pressure, while, if electricity is not available, a petrol or paraffin engine can be substituted for the electric motor.

**The Growth of Electricity Supply.**—Mr. W. W. Lackie, Chief Engineer of the Glasgow Corporation Electricity Department, in his presidential address to the Glasgow University Engineering Society last Thursday, gave some interesting figures showing the growth of the Glasgow undertaking. Twenty-five years ago there was one generating station in Glasgow, with 200 h.p. of plant; twenty-one years ago the Corporation put down a station with a plant capacity of 1,000 h.p. in six plant units. At the present time two turbines each of 9,000 h.p. are being installed, and it was stated that in the immediate future the plant unit would have a capacity of 20,000 h.p. Referring to his recent visit to America, he said that in Chicago he saw three power-houses each containing over 100,000 h.p., but two new stations were proposed, each with a capacity of 300,000 h.p. at least, leaving room for a third station on the same site. In Glasgow last year the Corporation sold 66 million units; in Chicago 800 million units were sold. In Glasgow last year the revenue was £346,000; in Chicago the revenue was £4,000,000 for the same period.

**Regulation of Signs in London.**—Included in the agenda for consideration by the last meeting of the London County Council were by-laws framed by the Building Acts Committee under the London Building Act, 1894. The by-laws state that no part of a sign or lamp, except for public lighting, shall be less than 8 ft. from the surface of the footway, nearer the roadway than 2 ft. 6 in. from the kerb, nor more than 5 ft. from its support. The size of new signs is also limited to 5 ft. in height and 3 ft. horizontally, and the weight is limited to 84 lb. A duplicate support must also be provided. If any new sign extends more than 2 ft. along a wall, it may not project more than 2 ft., and must not in any case be more than 2 ft. 6 in. in height, nor extend more than 6 ft. in any direction. Exemptions are granted for lamps used solely for the external illumination of windows if they are at least 7 ft. 6 in. from the footway, not nearer the roadway than 2 ft. 6 in. from the kerb, and do not project more than 3 ft. from the window. The actual lamp may not exceed 3 ft. in height, nor 2 ft. horizontally.

“ THE INDUSTRIAL APPLICATION OF ”

“ **Superlux** ”  
 GIVES PERFECT LIGHT

### Stands for Scientific Illumination.

Write for  
 Catalogue G. 1727.

“Superlux” metal reflectors embody a  
 self-contained ventilated gallery.

- ☐ By every known test it is proved that “Superlux” provides “the perfect light.” It produces the greatest quantity and the finest quality of illumination, with maximum efficiency.
- ☐ The Aluminium type, called “Superlux” Class III, is the popular warehouse type, remarkable for its superior reflecting surface prepared by a complex technical process, and for “truth” of contour. It is easy to clean and lightest in weight.
- ☐ In the TEXTILE WAREHOUSE “Superlux” Reflectors provide perfect illumination of even distribution; in ENGINEERING or HARDWARE STORES they enable the rapid assembling of parts and their accurate adjustment.
- ☐ In essentially damp or dirty situations the Vitreous Enamelled Steel type (“Superlux” Class II) is to be recommended. This reflector has the added quality of practical indestructibility of surface.
- ☐ “Superlux” Reflectors are made in Distributing and Concentrating types and a range of sizes and materials by which they

### ELECTRIC TRACTION NOTES

It is expected that the extension of the Baker Street and Waterloo (Tube) Railway to Paddington will be opened to the public on December 1st. Escalators are to be installed in place of lifts. An ordinary stairway will also be provided.

The Pietermaritzburg Corporation has decided, says the *Board of Trade Journal*, not to proceed with the trolley omnibus scheme, but a 40-h.p. petrol-electric char-a-banc has been ordered, so that the traffic value of different routes may be tested.

The Canadian Northern Railway has placed with the Canadian General Electric Company an order for the electrification of its lines between Montreal and Cartierville. There will be about ten miles of double track, and this passes through the Mount Royal Tunnel. Direct-current at 2,400 volts will be used on the contact line. The order includes seven locomotives and eight multiple unit motor-cars. The weight of each locomotive will be about 80 tons, and there will be two four-wheel trucks, each containing two interpole motors, permanently connected two in series and driving through twin gearing. The energy is to be purchased in the 11,000-volt three-phase 60-cycle form and converted by motor-generator sets, each consisting of a 2,100-k.v.a. synchronous motor driving two 750-kw. 1,200-volt interpole generators connected in series. The Castlegar branch of the Canadian Pacific Railway is also being electrified by the same company on this system at 2,400 volts D.-C.

In connection with the various proposals for tube railways to the Crystal Palace, the Underground Electric Railways Co. announce that they are prepared to make an extension of the "Bakerloo" line from the Elephant and Castle to the Crystal Palace, if the scheme receives support from the districts passed through.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A meeting was held in Brussels at the commencement of last month, at which the organisation of an International Commission to carry out wireless experiments was further discussed. At the International Time Conference in Paris last October the formation of an International organisation for the study of Hertzian waves was proposed, and Mr. Goldschmidt, of Brussels, placed his high-power station at Brussels and the sum of £1,000 for preliminary studies at the disposal of the proposed International Commission. The representatives of the different countries who were present at Brussels drafted a provisional constitution for the International Commission and a scheme for its work. The objects of the Commission are: to carry out experiments on the propagation of electric waves, to make wireless telegraph measurements, and to study problems relating thereto. The provisional programme includes measurements in different countries and at different distances and in different directions of the strength of signals sent out from the station at Brussels. These measurements will be repeated from day to day or hour to hour as necessary, in order to determine the variation of the strength of the signals, both with time, with distance, and with direction, and later the effect of wave length and decrement will be studied. It is proposed to set up a receiving station near the transmitting station in Brussels, in order to control the strength of the waves sent out accurately, so that an allowance can be made for any unavoidable variation. The organisation consists of a number of National Committees, who will send delegates to the International Commission. It is proposed that the Commission should meet once a year or more often if the

work is sufficiently advanced. The Institution of Electrical Engineers has decided to undertake the formation of the National Committee for Great Britain under the scheme for the organisation and encouragement of electrical research which was announced at the Institution meeting on December 12th last.

The first meeting of the newly formed Post Office, Telephone and Telegraph Society of London was held in the lecture theatre of the Institution of Electrical Engineers on October 27th. The President, Mr. A. Moir, read a Paper entitled "Some Features of the London Engineering District," in the course of which he stated that during the past year 102,000 miles of underground telephone line had been substituted for overhead work. At present, he said, there were 130,000 and 220,000 telephone stations in existence in London, while in 1921 it was estimated these figures would be increased to 267,000 and 432,000 respectively, and in 1928 still further increased to 414,000 and 680,000.

Among the countries to be represented at the International Conference on Safety of Life at Sea, which meets in London on November 12th, will be: the United Kingdom, Canada, New Zealand, Belgium, Denmark, France, Germany, the Netherlands, Norway, Russia, Spain, Japan, and the United States. The use of wireless telegraphy is among the many things to be considered.

The report of the Canadian Marconi Company for 1912-13 shows that the ship-to-shore station receipts totalled £10,850, compared with £9,450 in 1911-12. The Transatlantic returns totalled £9,380, compared with £5,760. Duplex working will be instituted between the wireless stations at Glace Bay and Clifden as soon as the latter station is complete. The company now works forty-four steamers on its own behalf, and four on behalf of affiliated companies.

An order has been placed for the equipment of a 1,200 line telephone exchange at Purley.

The *Board of Trade Journal* states that under a new Ordinance a licence granted by the Governor of Mauritius is necessary for working any wireless apparatus in the Colony, or on any ship registered in the Colony. The Ordinance also covers the working of wireless telegraph apparatus on board any ship in the territorial waters of the Colony. A similar Ordinance is also now in effect in Southern Nigeria.

Communication via Eastern Besika-Tenedos and Tchesme-Chio-Syra was restored on 24th inst.—The Pernambuco-Para cable of the Western Telegraph Company failed on the same day, and all telegrams for Ceara and north of that place are being sent via the Brazilian land lines.—On the 25th inst. the Cape St. Jacques-Pontianak cable was put into working order again.—On this day also the Chio-Tenedos and two cables between Chio-Tchesme again broke, but the repair, it is hoped, will soon be effected.—The French Cable Company is again in the list of sufferers by the failure of the Mole St. Nicholas-Port-au-Prince cable. Telegrams for the latter place are sent by land lines.—The first telephone and telegraph cable has been laid across the Danube between the New Roumanian territories.

**The Breakdown on the Metropolitan Electric Supply Co.'s System.**—In reference to our note on page 590 of last week's *ELECTRICAL ENGINEERING*, on the recent interruption of supply at Willesden, which was originally thought to be due to the failure of one of the 250-kw. step-up transformers (which are all of the Berry type), we are now in a position to state that none of these transformers had suffered injury or failed.

**Obituary.**—The death has occurred at Lisbon of Mr. A. S. Giles, General Manager Lisbon Tramways, at the age of forty-seven. Mr. Giles was formerly with the Edison Electric Light Co., the Edison & Swan Co., Messrs. Thomson, Ritchie & Co., and, from 1895 to 1904, with the Blackburn Corporation as Engineer and Manager of the electricity undertaking. In 1905 he went to Cape Town to undertake the management of an electrical scheme for a London firm, and in 1911 he was transferred to Lisbon.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published October 23rd, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**  
19,345/12. **Vehicle Lighting Dynamos.** S. L. PRICE. A pole pair is extended to form an auxiliary pole pair for the armature cross flux so as to distort the main field. The brushes have two or more places of contact, and a circumferential adjustment of the pole faces may be provided. One figure.

22,041/12. **Tungsten for Drawn Wire Lamps.** H. LEISER. An intimate mixture of dry powders of the crystalline and amorphous modifications of the metal, in the proportion of about 16 to 1, are pressed and heated to a temperature far below the melting point of the metal until the amorphous modification is changed into the crystalline.

27,069/12. **Parallel Running of Machinery with Different Characteristics.** BROWN, BOVERI ET CIE. Regulators which do not maintain constant the value of the quantity to be regulated over the whole range of regulation, but which vary it with the position of the regulating members within the regulating range in a definite sense, are used. For generators working in parallel the main windings of the regulators are fed from the pressure to be regulated, and additional windings are fed by the total current of all the generators. Six figures.

7,896/13. **Motor Speed Regulation.** A.E.G. A booster with series field winding is connected to the driving motor. This winding has a compounding effect during positive boost and a differential effect during negative boost. Thus the motor speed is kept constant irrespective of the load. Two figures.

8,821/13. **Wireless Telegraphy.** W. P. THOMPSON (*Ges. für Drahtlose Telegr.*). The receiver has a gaseous path permanently ionised by a heated cathode influenced by the incoming waves, which are strengthened by an auxiliary current, and by means of a rectifier are received by an indicator. The low-frequency currents furnished by the rectifier are also strengthened by a gaseous path. Three figures.

12,148/13. **Motor-driven Railway Signals.** C. W. WARD. The semaphore is biased towards the danger position, and is driven by a motor to the clear position, where it is held by a clutch. When this is released the semaphore tends to fall to the horizontal position, but may be stopped by a catch so that a third or "caution" position is given. Four figures.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** CANNOCK, 22,952/12; B.T.-H. Co. (*G.E. Co., U.S.A.*), 28,122/12; GEBR. SIEMENS [Electrodes] 7,108/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** LANDIS & GYR [Mixed load systems] 22,591/12; BROWN [Signalling and controlling apparatus by oscillations in supply mains] 22,649/12; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Motor control systems] 23,594/12; ROUTIN [Collective control of A.C. motors] 755/13; CREIGHTON [Circuit protection] 5,662/13.

**Dynamos, Motors, and Transformers:** PRICE [Conversion of electric energy] 22,524/12.

**Electrometallurgy and Electrochemistry:** QUAIN [Ozonisers] 22,854/12; LEE and BRAME [Metallic electro-deposition on hollow tubes] 23,096/12; WIELGOLASKI [Elongated arcs for gas treatment] 2,165/13 and 2,214/13; DECLERE, GRESY, and PASCALIS [Protecting silvered glass] 15,109/13; BALLY [Transformer furnace] 16,011/13.

**Heating and Cooking:** VENNEN, 23,082/12; NASH [Vulcanisers] 23,451/12; MARKS (*Landers, Frary & Clark*) 5,285/13.

**Ignition:** LEITNER [Starting internal combustion and other engines] 23,157/12; [Ignition] 23,430/12.

**Incandescent Lamps:** POPE'S LAMP CO. (*Trenzen*) [Metal filaments] 22,548/12; WARREN [Packings] 3,591/13.

**Instruments and Meters:** SMITH [Periodically testing currents] 24,960/12; B.T.-H. Co. and HOLDEN [Motor-meters] 28,227/12; HOLDEN and CHAMBERLAIN & HOOKHAM [Commutators] 28,316/12; SCHOTT & GEN. [Electrolytic meters] 10,512/13.

**Switchgear, Fuses, and Fittings:** CURTIS, MACKLEY and ADAMS MFG. CO. [Motor controllers] 22,747/12; PRENTICE and ATLAY [Distributing fuse board] 23,014/12; RIPPINGILLE and BROUGHTON [Conduits] 7,931/13; VOIGT and HALFFNER [Switches] 8,409/13; ELLISON and MUELLER [Motor controllers] 12,882/13; CHARLES [Tumbler switches] 16,151/13.

**Telephony and Telegraphy:** MARR [Telephone receivers] 23,240/12; HAMMER [Telephones] 29,036/12; SIEMENS & HALSKE [Number impulse transmitters for automatic telephones] 7,530/13; SIGNAL GES. [Submarine leakage telegraphy] 13,919/13.

**Traction:** WARD [Railway signalling] 22,833/12; McQUADE

[Trolley poles] 23,639/12; WELSH [Trolley wire anchor clips] 24,522/12.

**Miscellaneous:** SIMONSSON [Dash pot] 28,817/12; MARTIN and NIXEY [Signs] 3,562/13; HENRY [Advertising] 5,652/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, &c.:** HEINS [Substitutional lamp resistances] 9,530/13.

**Incandescent Lamps:** BLECKE [Metallic filament lamps] 22,093/13.

The following Amended Specifications may now be obtained.  
**Arc Lamps:** SIEMENS DYNAMO WORKS (*Siemens & Halske*) [Multiple carbon lamps with separate economisers] 14,685/11.

**Ignition:** B. BROOKS and W. HOLT [Self-starter for internal-combustion engines] 10,996/12.

## Amendments made to Specification

11,871/12. **Automatic Regulator for Variable Speed Dynamos.** H. D. EARL. The desired amendments (*ELECTRICAL ENGINEERING*, July 31st, p. 446) have been allowed with some modifications. A new paragraph states that the regulation is effected by an automatic shunt circuit resistance regulator having pairs of contacts whose resistance varies inversely as the pressure between their surfaces. A series and shunt coil are used. The former is "arranged to do more or less work on the contacts without an actual increase or decrease of current therein."

## Applications for Restoration of Lapsed Patents

5,522/07. **Electro-magnetic Separator Drum for Grain Conveyors, &c.** JAMES HAWLEY, LTD., and A. S. JONES. Any opposition to the restoration must be made at the Patent Office before December 22nd.

5,286/08. **Apparatus to Determine Time Integrals.** H. L. MERRICK. Any opposition to the restoration must be made at the Patent Office before December 11th.

## Opposition Entered to Grant of Patent

25,902/12. **Annealing Silicon Steel.** B.T.-H. Co. (*G.E. Co., U.S.A.*). The claims are for treating silicon steel so as to improve its magnetic qualities by heating it above the ordinary annealing temperature to about 1,000° C., as it is passed through a non-oxidising atmosphere or reducing gas.

## Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

21,637 of October 30th, 1899. **Arc Lamp Electrodes.** H. BREMER. In addition to the admixture of 10 to 70 per cent. of metallic powder or salts to the pure carbon, one or more per cent. of a flux, e.g., boron and fluorine, is added to soften the otherwise solid scoria formed on the electrodes by the luminous metallic vapours, so that it may drop off.

21,778 of October 31st, 1899. **Lifts, Automatic.** H. ROWNTREE. There are 14 figures and 59 claims to this specification, which describes in detail a complete automatic push-button lift system.  
21,881 of November 1st, 1899. **Incandescent Lamps.** H. H. LAKE (*Soc. de Commentry-Fourchambault et Decazeville, France*). The leading-in wires for incandescent lamps are made of nickel steel alloys, 29 to 30 per cent. nickel, or 43 to 48 per cent. nickel, having the same expansion as the glass.

22,020 of November 3rd, 1899. **Wireless Telegraphy.** W. P. THOMPSON (*F. Braun, Germany*). This, together with Patent No. 1,862/99 by the same inventor, was unsuccessfully cited in the patent action by the Marconi Co. against the British Radio-Telegraph & Telephone Co. in 1910-11 as anticipating the Marconi patent 7,777/00. The claim reads: "In electric wireless telegraphy the use of transformers the primary of which is joined in the circuit of the air gap and the secondary of which is connected in the sending wire."

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** D. TIMAR and K. VON DREGER [Parallel carbon lamps] 12,656/08.

**Distributing Systems, &c.:** F. CONRAD [Pressure regulation by storage battery, boosters, &c.] 15,441/07; [Dynamo regulation] 15,442/07.

**Electrochemistry and Electrometallurgy:** M. RUTHENBURG [Fritting comminuted ores in furnace] 15,867/01.

**Instruments and Meters:** E. S. HALSEY [Modified construction of mercury motor meters described in specification 12,635/99] 2,345/01; M. KALLMANN [Self-adjusting load for A.C. meter calibration] 28,048/06; L. A. BERLAND [Prepayment meter] 4,828/07; H. J. HADDON (*Bergmann A.-G.*) [Induction motor meter] 15,551/07.

**Miscellaneous:** R. W. ROBSON and G. W. CLEGG [Temperature indicator for bearings, &c.] 15,245/06; G. SCHAULI [Dry battery] 14,609/08, 24,355/08, and 24,356/08.

## LOCAL NOTES

**Barnes: Tariff for Arc Lamps.**—It has been decided to reduce the tariff for supply to outside arc lamps to 3d. per unit.

**Bradford: Electricity Accounts.**—The report for the year ended October records increase in all branches of supply. The total units (for the financial year ended March 31st) were 24,418,292, or over two million in excess of the figure for the previous year. The revenue was £9,802 greater than in any previous year, and notwithstanding an increase of £5,000 in the cost of fuel, a net profit of £8,477 was made, £425 greater than that of the previous year. The plant extensions carried out during the year are recapitulated in the report. The number of consumers connected increased by 10 per cent., and the total costs (not including capital charges) work out at 0.568d.

**Bromley: Demonstration of Electric Cooking.**—Demonstrations of cooking and other domestic uses of electricity are being given at the offices of the Bromley (Kent) Electric Light & Power Co.

**Coniston: Proposed Electric Power Scheme.**—A scheme for supplying the district by utilising water-power in the neighbourhood has been submitted to the Council and is under consideration. Probably the Mines Fall would be utilised.

**Dudley: Sale of Electrical Undertaking.**—The opposition of the Traders' Association to the proposed sale of the electrical undertaking has now been withdrawn.

**Edinburgh: Electricity Supply.**—The question of whether the projected new generating station is to adjoin the M'Donald Road works or be near the sea is still under consideration, but in the meantime the Electricity Committee has agreed to accept an estimate of £12,000 for plant extensions at M'Donald Road. It has been decided not to accede to the demand for continuous current in Portobello, on account of the high cost of mains that would be involved. A tariff of 1½d. per unit for heating purposes has been fixed for consumers outside the city boundary, which is ¼d. more than that within the city.

**Exeter: Interruption of Supply.**—The newspaper reports as to interruption of supply last Tuesday seem to have been exaggerated. We find on inquiry that there was a failure of the supply in a small section of the town, which lasted about twenty-five minutes, due to water penetrating the lead sleeve joint on a H.T. cable.

**Glasgow: The Supply to Partick.**—In order to bring the district into line with the rest of Glasgow, the voltage at Partick, which was recently incorporated into the city, is to be raised from 240 and 480 to 480 and 500 volts. The Corporation will bear any cost of the change to consumers.

**Llanfairfechan: Electricity Supply.**—It has been decided to apply for a provisional order for an electric lighting scheme, which is estimated to cost £5,500.

**Lossiemouth: Electric Supply Scheme.**—The Board of Trade has not yet given its decision regarding the use of overhead mains, and is still in communication with the Post Office on the subject, but the Scottish Office has sanctioned the borrowing of £6,000 on certain terms.

**Lytham: Bulk Supply.**—The Council has decided not to take a bulk supply from St. Anne's, and steps will probably be taken to construct a generating station in Lytham.

**Manchester: Wiremen's Strike.**—A strike of wiremen commenced on Monday. An application has been made for an advance in wages of 1d. per hour, and the Electrical Employers' Association has offered to submit the question to arbitration, or, in the alternative, to grant an advance of ¾d. per hour, making the rate 9½d. per hour, to take effect on the first pay day after January 1st, 1914, on the understanding that six months' notice of any proposed alterations shall be given by either side. This offer has been refused. Between 300 and 400 men are out.

**St. Helens: Electricity Accounts.**—The total costs for the year are given as £25,722, including interest and other capital charges, and the receipts as £27,351, so that a final surplus of £1,629 remains. The total units sold were 4,890,438, and the maximum demand was 2,135 kw.

**Sheffield: Electrical Exhibition.**—The Fuel, Light, and Power Exhibition which is being held in connection with the smoke abatement movement in Sheffield was opened at the City Exhibition Hall on Friday by Mr. C. D. Leng, who, in his opening speech, referred particularly to the cheapness and other advantages of electric power.

**Teignmouth: Electricity Supply Scheme.**—A report by Mr. E. M. Lacey on a proposed supply scheme is being considered by the Council. The cost of the scheme, which includes distribution by underground cables in Teignmouth itself, and by overhead mains in Shalden and other outlying districts, is put at £20,800.

**Waterford: Electric Supply Scheme.**—A report has been received from Mr. E. M. Lacey estimating the cost of a local electric lighting scheme at £27,338, and it has been decided to apply for a provisional order in order to bring this into effect.

**Whitstable: Electric Supply Scheme.**—As the result of recent negotiations with the Council regarding street lighting, &c., the Whitstable Electric Co., Ltd., has been registered with a capital of £18,000.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Bolton.**—A loan of £7,889 for extensions has been sanctioned by the L.G.B.

**Fleetwood.**—Tenders are invited for L.T. cable by November 1st. Particulars from A. Cottam, Town Clerk.

**Grimsby.**—Tenders are invited by November 18th for metal filament lamps, continuous-current motors, motor panels, house fuse and service boxes, &c. (See an advertisement.)

**Leicester.**—A L.G.B. inquiry was held last week into an application for a loan of £52,350 for additional generating plant at the Aylestone power station.

**London: Hackney.**—A loan of £56,748 for extensions has been sanctioned by the L.C.C.

**New Zealand.**—Tenders are invited by January 5th for series incandescent street lighting equipment, including underground and aerial cable, ten constant current transformers and control panels, 1,950 metal filament lamps with reflectors, four miles of flexible steel span wire, with 5,500 porcelain insulators.

**Ormskirk.**—A loan of £1,000 for new generator, gas engine, and water-softening plant is to be applied for.

**Salford.**—Application is to be made to the L.G.B. for sanction to a loan of £10,500 in connection with the additional supply of current to the No. 9 Dock of the Manchester Ship Canal.

**Todmorden.**—A Local Government Board inquiry into an application for a loan of £5,800 will be held on November 7th.

**Whitworth.**—A Local Government Board inquiry into an application for a loan of £10,965 will be held on November 5th.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Banff.**—The Lunacy Board has decided to instal electric lighting at the asylum.

**Barrow.**—New police station.

**Darwen.**—New warehouse, Wallpaper Manufacturers, Hollins Mill.

**Durham.**—New army barracks.

**Hastings.**—A winter garden or kursaal on the hospital site on the sea-front.

**Hendon.**—Swimming bath and public hall at Burroughs.

**Horwich.**—New Reform Club.

**Leigh.**—Enlargement of Territorial headquarters. Surveyor, E. L. Territorial Association, Town Hall Chambers, Ashton-under-Lyne.—Extensions of technical school. Architect, H. Littler, 16 Ribblesdale Place, Preston.

**London: Islington.**—Cinematograph theatre, 83-86 Upper Street.

**Poplar.**—Cinematograph theatre, Robinhood Lane.

**Stepney.**—Cinematograph theatre, Osborn Place.

## THE RECORD ELECTRICAL Co., Ltd.

LONDON OFFICE:  
CAXTON HOUSE,  
WESTMINSTER, S.W.

Telephone:  
3067 Victoria.  
Telegrams & Cablegrams:  
"Infusum,"  
London.

**ON A SCALE  
OF INSTRUMENTS.**

**RECORD'S PATENT.**

**Write for Prices & Particulars.**

WORKS:  
BROADHEATH,  
MANCHESTER.

Telephone:  
104 Altrincham.  
Telegrams & Cablegrams:  
"Infusum,"  
Altrincham.

**Middleton.**—Addition to works of Malta Mill Co., Mills Hill Road.

**Ruthin.**—New infirmary.

**Stoke-upon-Trent.**—Children's Hospital.

### TENDERS RECEIVED AND ACCEPTED

**Carlisle.**—The tender of the Union Electric Co. for two motor alternators and switchgear at £900 is recommended for acceptance, subject to the sanction of the Local Government Board.

**Glasgow.**—A pair of boilers is to be equipped experimentally with a new automatic stoker by the American Engineering Co., at a cost of £1,400. The company is to remove them free of cost if not satisfactory.

**Heywood.**—The tender of Bertram Thomas for switchboard alterations has been accepted.

**London: St. Pancras.**—The tender of Heenan & Froude for a wet-air filter to be used in connection with the new 1,000-kw. Ljungstrom turbine for £160 has been accepted.

### APPOINTMENTS AND PERSONAL NOTES

The wedding of Mr. W. M. D. Pell, director of Oliver Arc Lamp, Ltd., Engineering & Arc Lamps, Ltd., and the Varley Magnet Co., Ltd. (second son of the late Mr. Bennett Pell), to Miss E. G. Sandwith, only daughter of the late Col. Hartley Sandwith, C.B., took place at Woking, on Tuesday.

Mr. W. W. Warren has resigned his position as charge shift engineer at the L.C.C. tramway generating station at Greenwich.

Mr. D. Blackley has resigned his seat on the special Committee of the L.C.C. on London Electricity Supply.

The salary of Mr. E. Lunn, Station Superintendent at Huddersfield, is to be increased from £180 to £200 per annum. The National Boiler & General Insurance Co., of Manchester, require electrical inspectors. (See advertisement on another page.)

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £77 10s. to £78 (last week, £78 to £78 10s.).

**Pope Lamps.**—With reference to our notice in this column and to Pope's Electric Lamp Company's advertisement last week, the company announce that they have been asked for the name of their solicitors, with a view to legal proceedings being taken against them for infringement, and specially ask their clients to note their absolute assurance that their indemnity holds good against all risk of action and damages.

**Shooting Match.**—On Tuesday evening last, a return match between Siemens Dalston Miniature Rifle Club and the Western Electric Co. was shot at Dalston, the result being a win for Siemens. The average scores were 95.3 for Siemens and 88 for the visitors.

**Exhibition Awards.**—J. H. Heathman & Co. (Parsons Green, Fulham, S.W.) have been awarded gold medals at the Anglo-German and Imperial Services Exhibition for exhibits of ladders, trestles, and steps. Mr. Heathman informs us that he has erected a water tower 65 ft. high at his factory, and intends to install a system of automatic sprinklers of his own manufacture.

**Anti-vibration Foundations.**—The Korfund Company (320 Bank Chambers, High Holborn, W.C.) inform us that they have been awarded a gold medal of the International Building Trade Exhibition at Leipzig for their Korfund insulation system.

**Igranic Electric Co.**—The liquidator of the Adams Manufacturing Co., Ltd., has now issued a formal notice that the sale of the electrical business of this company to the Igranic Electric Co., Ltd., has now been completed, and

all business communications should be sent either to the works of the latter company at Bedford, or to their London office, 147 Queen Victoria Street. The Igranic Electric Co. announce that they are prepared to enter into contracts for the manufacture and supply of motor control gear for all purposes, as well as the types manufactured by their predecessors under the trade name "Igranic."

**Bankruptcies.**—A meeting of creditors of the Ridings Arc Lamp Co. (in liquidation) will be held on November 6th at 9 Parr Street, Liverpool.—A dividend of 20s. in the pound and 4 per cent. interest will be paid by Mr. C. Lewis, electrical engineer, of 29 Seymour Grove, Old Trafford, on Friday, October 31st, at the Official Receiver's offices, Byrom Street, Manchester.

**Liquidations.**—A general meeting of the De Forest Wireless Telegraph Syndicate will be held at the offices of Messrs. Allen Attfield & Co., 147 Leadenhall Street, London, on November 6th, at 11.30 a.m., to hear the liquidator's account of the winding up.

A general meeting of the Provincial Electrical Co., Ltd., will be held at the offices of Mr. T. B. Scattergood, 125 Edmund Street, Birmingham, on November 4th, at 2.30 p.m., to hear the liquidator's account of the winding up.

### COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

**Cleveland & Durham Electric Power.**—The accounts for last year, which show a net profit of £43,590, were adopted at the meeting last week. Mr. James Falconar, M.P., who presided, said that the position of the company was very satisfactory, and that among the contracts pending was one with the North-Eastern Railway Co. in connection with the electrification of a further 20 miles of single line as a test for working goods traffic. If this was successful, it was no secret, he said, that further extensions of their electric lines would be made by the railway company, which held out good prospects for the company in the future.

**Chloride Electrical Storage Co.**—An interim dividend of 5 per cent. is announced on the ordinary shares.

### NEW COMPANIES

**OSTRA LIGHT CO.**, 11 Queen Victoria Street, E.C. Capital £1,650. To deal with electric lamps, apparatus, &c.

**FORWARD ELECTRIC CO.**, Fountain Works, Lennox Street, Birmingham. Capital, £2,000.

**WENSLEYDALE GAS AND ELECTRICITY CO.** Registered by Jordan & Sons, 116 Chancery Lane, London. Capital, £5,000.

**CONTINUITY JOINT & TUBE CO.**, 27, St. Mary Axe, E.C. Capital £5,000. Electrical engineers and contractors.

**BENTHAM ELECTRIC SUPPLY CO.**—Capital, £1,000. Private company. Subscribers:—C. H. Best, T. E. P. Ford, E. Ayrton, J. Parker, J. Cumberland, C. Bullan, and H. H. Cass. 24 Cunliffe Terrace, Bradford.

**The Electrical Trades Union.**—Members of this Union in the London district met on Tuesday last in a large hall in Holborn to consider the final arrangements to secure an advance of wages. A resolution was carried instructing the London District Committee to formulate demands on both associated and non-federated employers, embodying 11d. an hour for electrical fitters and wiremen, with a recognised code of working rules, other grades to receive corresponding increases.

**The Storm in South Wales.** Considerable damage was done in the Aber Valley by the great storm on Monday night to the electrical undertakings, and at Senghennydd, Abertridwr, Penyrhoel, and Caerphilly supply was interrupted owing to lightning effects. Great inconvenience was caused at the pit-head of the Universal Colliery, where the work preparatory to exploring the mine after the disaster is being continued night and day. The roof of the Pontypridd generating station was torn off, and the telephone wires got so entangled with the tramway wires that the service had to be suspended. Supply was also interrupted at Bargoed in the Rhymney Valley, and telephone communication in that district was seriously interfered with.

## SUMMARY

PROF. E. W. MARCHANT in his address to the Manchester Local Section of the Institution of Electrical Engineers, urged that the remuneration of electrical engineers was in general too low to attract the best into the profession in the future. (Page 612.)

SOME notes on the progress made in the application of electricity to mines in Cornwall, and some information concerning the working of different classes of mining machinery, were recently given by Mr. L. A. Hards in a Paper read before the Cornish Institute of Mining, Mechanical and Metallurgical Engineers. (Page 613.)

THE exhaust steam generating equipment at the Bedwas Colliery is referred to, and some notes on the method of driving and on the pumping plant are given by Mr. E. L. Hann. Although three-phase supply is utilised, D.C. motors, supplied through a rotary-converter, are employed, and the author's reasons for this course are interesting. (Page 614.)

SOME details are given of an electric winding engine in Scotland. (Page 614.)

A HOME OFFICE prosecution for contravention of the electrical mining rules in Scotland has resulted in conviction of the manager on a few of the charges with a nominal fine. The agent was acquitted, but the electrician was fined for failing to examine the plant properly. (Page 615.)

THE patent specifications dealing with electrical mining and metallurgical matters, published last month, deal with miners' safety lamps, hauling and winding

plants, the driving of three-high rolling mills by induction motors, and electric furnaces. (Page 615.)

WE give some further notes on the exhibits at the Glasgow Electrical Exhibition. (Page 617.)

AN accumulator truck, a traction lamp, a new design of radiator and an electrically driven fire-pump are described in short articles on page 618.

THE relative merits of the tree and distribution board systems of wiring are discussed in our "Questions and Answers" columns. (Page 619.)

A PROGRAMME of Papers and addresses to be read at London and provincial meetings of the Institution of Electrical Engineers has been issued. (Page 619.)

AMONG the specifications published last week by the Patent Office was one by the B.T.-H. Co. dealing with the dynamic braking of motors for machine tool driving. The B.T.-H. Co. are also protecting a design of A.C. flame arc lamp in which a specially designed auto-transformer is used. R. F. Venner protects cooking apparatus in which the heating element is encased in oil, and Pope's Electric Lamp Co. has a process for drawing metal filament from a cold sintered mixture of tungsten and thorium. (Page 620.)

WE give some detailed particulars of the new loaded telephone cable between England and Ireland. Considerable dissatisfaction is being felt in the watch and clock making industry at the charges made by the Post Office for licences to receive time signals. (Page 622.)

CONSTRUCTIONAL work has been started on the lines of the London & South Western Railway, which are to be converted to electric traction.—The "Railophone" system of signalling is to be adopted experimentally on the Midland Railway. (Page 622.)

THE dispute as to whether the Bury Corporation or the Lancashire Electric Power Co. shall supply in bulk to the Heywood Council was inquired into by the Board of Trade last week.—The Shoreditch Borough Council has rejected an offer by the County of London Electric Supply Co. to give a supply of electricity in bulk.—Some interesting electric cooking demonstrations and lectures have been carried out at Llanelly.—There are signs that the electrical wiremen's strike in Manchester will soon terminate by the employers granting the men's demands.—The rateable value system of charging has been adopted at Dewsbury.—The Gillingham Council are contemplating arranging their Diesel engine for running on gas tar oil. (Page 623.)

EXTENSIONS to plant, mains or services are contemplated at Wigan (£8,000); Darlington (£21,000); South Shields (£33,000); Finchley (£13,500); Harrogate (£9,439); and Gillingham (£5,000). A new sub-station is to be erected at Hornsey, and electric lighting schemes are under consideration at Teignmouth and other places.—Ten bogey trams are required at Bournemouth; and arc lamps at Hammersmith. (Page 623.)

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, NOVEMBER 6TH.

*Institution of Electrical Engineers: Yorkshire Section.*

7.15 p.m. At Hotel Metropole, Leeds. Reception and Address by the Chairman, Mr. W. B. Woodhouse. Smoking concert to follow.

SATURDAY, NOVEMBER 8TH.

*Manchester Association of Engineers.*

7 p.m. At Grand Hotel, Manchester. "Recent Developments in Steam Condensing Plants," by A. E. L. Scanes.

*Birmingham and District Electric Club.*

7.30 p.m. At Swan Hotel. "Motor-car Lighting by Electricity," by H. F. Steventon.

MONDAY, NOVEMBER 10TH.

*Institution of Post Office Electrical Engineers.*

5 p.m. At Institution of Electrical Engineers. "Telephone Engineering Economics," by H. A. Smith.

*Institution of Electrical Engineers: Newcastle Section.*

7.30 p.m. At Armstrong College. "Steam Boiler Working in Electrical Power Stations," by J. W. Jackson.

TUESDAY, NOVEMBER 11TH.

*Institution of Electrical Engineers: Scottish Section.*

8 p.m. At 207 Bath Street, Glasgow. Inaugural Address by J. A. Robertson.

WEDNESDAY, NOVEMBER 12TH.

*Institution of Electrical Engineers: Birmingham Section.*

7.30 p.m. At the University. "The British Standard Specification of Consumers' Electric Supply Meters," by S. H. Holden.

*Association of Engineers-in-Charge.*

7.45 p.m. At Marconi House, Strand. "Wireless Telegraphy," by Capt. H. Riall Sankey.

THURSDAY, NOVEMBER 13TH.

*Institution of Electrical Engineers.*

8 p.m. At Victoria Embankment. Address on "Pressure Rises" (experimentally illustrated), by the President.

## The London Electrical Engineers.

(TO-DAY) THURSDAY, NOVEMBER 6TH.—C. Company. Technical Instruction, 7 to 10 p.m.; Meeting of N.C.O.'s at 7 p.m.

FRIDAY, NOVEMBER 7TH.—D. Company. Technical Instruction, 7 to 10 p.m.; Meeting of N.C.O.'s at 7 p.m.

SATURDAY, NOVEMBER 8TH.—Headquarters open from 10 a.m. till noon.

MONDAY, NOVEMBER 10TH.—A. Company. Technical Instruction, 7 to 10 p.m.

TUESDAY, NOVEMBER 11TH.—B. Company. Technical Instruction, 7 to 10 p.m.

WEDNESDAY, NOVEMBER 12TH.—Recruits only. Infantry Drill and Technical Instruction, 7 to 10 p.m.

THURSDAY, NOVEMBER 13TH.—C. Company. Technical Instruction, 7 to 10 p.m.

FRIDAY, NOVEMBER 14TH.—D. Company. Technical Instruction, 7 to 10 p.m.

SATURDAY, NOVEMBER 15TH.—Headquarters open from 10 a.m. till noon.

## REMUNERATION OF ELECTRICAL ENGINEERS

PROF. E. W. MARCHANT'S address to the Manchester Local Section of the Institution of Electrical Engineers was entitled, "The Vocation of an Electrical Engineer," and contained a plea that the importance of the work being carried on by members of the electrical engineering profession should be better recognised and rewarded, as by this means only could we ensure that men of the high degree of training, ability, and intelligence required to keep pace with the ever-widening developments of that branch of engineering could be available to carry on its progress. Dealing with the various sections of the profession in turn, he showed first how enormous was the field for the central station engineer, although the remuneration offered to those taking up this work was quite inadequate to the responsibility. Many successful central station engineers had forsaken their positions to take up consulting work, and the difficulty experienced by the large power companies in obtaining suitable men was increasing. Electric railway work was increasing in importance, and he looked forward to the time when the position of mechanical engineer to a railway would be filled by an electrical engineer, who, like the former, could reasonably aspire to the general managership. All this showed the high type of man demanded. In manufacturing work also, technical knowledge of the highest order is required to fill the highest posts, but men eligible for these positions are discouraged by the low salaries obtainable while they are climbing the ladder. In order to attract the best type of men into the profession, it was imperative that the standard of remuneration for technical men must be advanced. Prof. Marchant had also a good deal to say regarding telephone and telegraph work, and hoped that the higher administrative posts in this service would in the future be more open than they appear to be at present to those who have a thorough knowledge of the technique of telegraphy and telephony. To get the right kind of person, the engineering side must be made attractive enough to ensure that the most able men shall think it worth while to become telegraph engineers. Similar arguments were applied to electrochemical engineering. The matter, he said in conclusion, is one of supply and demand; the supply hitherto has been ample, the demand meagre; now demand is overtaking supply, and the necessary consequence to an increased demand is either a worse quality of product or a higher price.

WASTE (see "ELECTRICAL ENGINEERING," October 30th, page 601).

Mr. Vernier in his address at Newcastle spoke of the desirability of co-operation between Municipalities and Power Companies by giving the former a financial interest in the undertaking and representation on the Board.

COUNCILLOR REDRAGGE (who represents £200,000 held by the Corporation of Manningborough), interrupting the reading of the Balance Sheet:—Afore we proceed, gen-l-mn, I'd like ter raise the question o' the discharge of stoker Slacke because 'e disagreed with the shift engineer about the rate at which it was desirable to fire the boilers. . . . (Consternation.)

## ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

### ELECTRICITY IN CORNISH MINES

AT the opening meeting of the Cornish Institute of Mining, Mechanical, and Metallurgical Engineers, held last month, Mr. L. A. Hards (engineer and manager, Cornwall Electric Power Co.), read a Paper on "The Application of Electricity to Cornish Mining." The output of the Cornwall Power Co.'s works at Hayle, said the author, was now nearly 20 million units per annum. To illustrate the saving in capital outlay by the adoption of electric power from an outside source, he assumed a mining undertaking, with a capital of £50,000, earning 25 per cent. and using 1,500,000 units per annum, at a cost of 0.75d. per unit, or £4,680 per annum. Private plant would cost about £10,000, and, allowing 10 per cent. for depreciation, the distribution would be reduced from 25 per cent. on a capital of £50,000 to 19 per cent. on £60,000. Thus the cost per unit would have to be not more than 0.19d. per unit to bring the profit back to 25 per cent. This calculation was made on the assumption of a 25 per cent. profit, which is not high for a mining concern, and the £10,000 cost of plant might have meant the difference between 25 per cent. and no dividend at all if there was a shortage of money to get the concern into fair working operation.

The author then dealt with the question of pumping, which he divided into two classes, unwatering and permanent pumping. Nothing, he supposed, had retarded the progress of electricity in Cornish mines so much as the trouble experienced with turbine pumps, where it had been tried to pump comparatively small quantities of gritty water through small passages with impellers running at high speed. High-speed machinery of this kind required careful attention, and in using this type of pump it would be well to work in two shafts at the same time. He thought it preferable for unwatering not to use pumps for too high a lift. It would certainly be more economical for, say, a 1,000-ft. water lift, to use two 500-ft. pumps—generally a turbine pump has a maximum efficiency when the gallons per minute are approximately equal to the head in feet. To prevent overloading of the main motor he suggested that it might be possible to have one or two small single-stage sinking pumps below the main pump, capable of pumping, say, 40 or 50 ft., delivering to a tank about 3 ft. 6 in. square by 10 ft. long, from which the large pump could pump intermittently. The ideal arrangement would be pumps running intermittently, spaced at various levels on moderate heads, so that economies in the power demand would result.

So far no satisfactory rock drill had been tried in Cornwall. The question of weight was serious, but the author did not think that there was much in the argument that with the pneumatic drill there was a supply of air for ventilation, since it took about 20 h.p. at the surface to produce 3 or 4 h.p. below, so that there was some margin for ventilation at low pressure with electric drills. There were a number of electrically-driven compressors connected to the mains. One especially was interesting. This was a Holman's 1,000 cub. ft. rope-driven compressor, arranged to start and stop automatically. It was driven by a 215 h.p. motor running at 240 r.p.m. The control was by a small relay operated by the air pressure, so that the compressor was always at work at full load and maximum efficiency. It took 25 secs. to start, but by increasing the current this could be reduced to 10 secs. At present there were no large winders connected to the system, but, said the author, there is every possibility of some being connected in the near future. From particulars for a number of collieries using steam winding, and raising 2,000 to 3,000 tons per day, he found that on the average about 14 lbs. of coal per effective h.p. hour in the shaft were required, which, at 18s. per ton, gave a cost as high as 1s. 4d. for coal only. Large electric winders could not, however, be dealt with in the generating station until recently, but the present plant at Hayle could do this satisfactorily. With regard to rock-breakers, there were now a number electrically-driven, and the use of electricity was proving very economical: for instance, a rock-breaker, 20 ft. by 10 ft. and motor 40 h.p. to start, and 45 h.p. peak, only took about 7 h.p. average as registered by meter. With regard to stamps, there was no difficulty in driving any kind, but the author pointed out that the motor should drive, whenever possible, through high-class single reduction gearing or through chain belts.

Vanners and shaking tables took very little power to drive, and were generally grouped. Recently there had been a tendency to speed up the countershafts. This allowed the use of cheaper shafting and higher-speed belts, and, consequently, a lower belt tension and lighter belts, as larger pulleys might be used. Pulverisers also were machines which had been very satisfactorily driven electrically for a number of years. Whenever possible, gearing was used on low-speed drives, and was placed between the low-speed machines and the counter-shaft, and not between the motor and the counter-shaft.

The following figures relate to the h.p. in motors at the present time connected to the mains of the Cornwall Power Co.:—Stamps, 826; crushers, 315; vanners, 240; pulverisers, 916; pumps, 1,200; dredges, 75; haulage, 190; compressors, 1,185; and miscellaneous, 339. In addition, the company has a lighting load of 720 h.p. and a tramway load of 500 h.p. and 934 h.p. connected to engineering works. It has been found that Californian stamps, with a 30-h.p. motor, 10 heads of 1,050 lbs. each, and 98 drops, takes 20 units per hour. Nissen stamps, with an 11-h.p. motor, two heads of 2,000 lbs. each, and 94 drops, take 7.85 units per hour; but it is thought that with more heads and a larger motor, these would be more efficient. Pneumatic stamps, with a 130-h.p. motor, 4 heads of 1,250 lbs. each and 120 drops, take 80 units per hour. Crushers present a considerable variation in power according to duty, but on the average a 24-in. crusher at 192 r.p.m., takes a maximum demand of 56 kw. and 12.7 units per hour; while a 20-in. crusher at 190 r.p.m. takes 17 kw. and 3.0 to 9.0 units per hour. A 13 ft. 6 in. by 3 ft. 6 in. tube mill pulveriser, running at 24 r.p.m., dealing with 45 tons per day, takes 12 units per hour; four 6 ft. by 2 ft. 6 in. pulverisers, also running at 24 r.p.m. and dealing with 2 tons per day, take 13 units per hour; while a 6 ft. by 2 ft. 6 in. machine at 35 r.p.m. takes 2.3 units per hour, and at 56 r.p.m. 3.3 units per hour. Twenty vanners take 7.3 units per hour, and 22 Wilfly tables take 9.8 units per hour.

**"Wireless" Telephones in Mines.**—The Reineke system of telephonic and telegraphic communication in mines, previously referred to in *ELECTRICAL ENGINEERING*, has been installed by the Clifton & Kersley Coal Co., Ltd., in its colliery at Astley Green.

**Scottish Mining Electrical Engineers.**—The opening meeting of the session of the West of Scotland Branch of the Association of Mining Electrical Engineers was held on October 18th, in Glasgow. The President, Mr. M. Brown, in his address, mentioned that the branch was now the leading one in point of numbers. It was further announced that arrangements were being made for holding district meetings in Hamilton, Larbert, and Kilmarnock, with a view to creating additional interest in the branch. In the course of a discussion with the Scottish branch of the National Association of Colliery Managers on October 25th, Mr. A. Anderson (Wishaw), observed that it was pleasing to note that the number of accidents due to electricity was decreasing. This was due both to the design, manufacture, and maintenance of the plant. The latter was most essential. It seemed to him that the scarcity of labour at the present day made the use of electricity not only advisable but absolutely essential if the country was to go on its way uninterrupted.

**Power Generation at the Pit's Mouth.**—A joint meeting of the Kent Branch of the National Association of Colliery Managers and the London Branch of the Association of Mining Electrical Engineers was held recently at Dover, and Mr. E. Kilburn Scott read a paper on large prime movers and boilers for power houses. The prosperity of the country, he said, depended largely on cheap power supply, and the only way to compete with water-power countries was to centralise electric-power supply in the colliery districts. Turbo-alternators of 20,000 to 50,000 kw. were already being built, and in his opinion an ideal electric power station would give, say, 100,000 kw. in four or five steam turbines supplied with steam from boilers fired by gas obtained from by-product plants using coal direct from the pit. Such a station could supply power to a profitable electrochemical or electrometallurgical load with a good load factor at one-tenth of a penny per unit. He thought that the primary power houses of the future would be situated on the coal fields, and the present municipal and other stations would become sub-stations. The sixty odd power stations of greater London, for example, could derive their energy from the Nottingham, Warwickshire, Forest of Dean, and Kent coalfields. The transmission lines could be along the railway routes, and the railways themselves would be converted to electric traction.

## ELECTRICAL PLANT AT BEDWAS COLLIERY

THE last issue of the *Proceedings* of the South Wales Institute of Engineers contains a Paper on the sinking and equipping of the Bedwas Navigation Company's Colliery, by Mr. E. L. Hann. There are two shafts, each 21 ft. in diameter, about half a mile east of Bedwas Station. The permanent plant was installed before sinking, and the cost of fuel during sinking was £7,786, which the author compares with £16,801 spent on fuel in sinking at Penallta under similar conditions. At Bedwas the sinking was carried out at a faster rate, and, by the use of a mixed-pressure turbine, practically the whole of the electric power required for pumping, ventilating, and small surface motors was produced from the exhaust of the winding engines and air compressor. A 500-kw. 3,000-volt 50-cycle reciprocating set was used to drive the small motors, for lighting, and to do any electric pumping that might be necessary before the larger electric generators were installed, and the ventilation was done by means of an electrically-driven fan of 8,000 cub. ft. per hour capacity at the top of each pit, and air pipes 2 ft. in diameter were used in the shaft.

The exhaust-steam plant was installed almost immediately after sinking commenced. This comprised a Rateau accumulator, designed to give sufficient storage to bridge over winding-engine stops of 45 secs.; a 1,250-kw. B.T.H. Curtis mixed-pressure turbo-alternator with Le Blanc jet type condenser, and motor-driven rotary air pump designed for 27½ in. vacuum. The engines can exhaust into the accumulator, or, if the turbine is not running, into the condenser direct. Any surplus steam from the accumulator is taken to a feed-water heater, so that no exhaust steam escapes to the atmosphere unless the feed water is already at approximately boiling-point. In order to obtain duplicate fan and compressor drives, as well as economical driving on low loads, and also to use all the exhaust steam available, the main ventilating fan was provided with steam and electric drive, and one of the three air compressors (two are of 4,000 cub. ft. per minute and the other of 5,000 cub. ft. per minute capacity) are driven electrically. At the same time, a second 1,500-kw. mixed-pressure turbo-alternator, running at 3,000 r.p.m., was installed.

Many schemes for variable-speed electric drives were considered, and eventually 500-volt D.C. motors, driven through rotary converters, were chosen. In considering the best system to adopt, the following were the conditions which influenced the decision in favour of the D.C. plant:—

(1) A complete range of speed between 72 and 135 revolutions per minute would be obtained for the fan drive, which would be required in opening out the colliery. (2) Simplicity of speed control. This is especially valuable on the air-compressor drive, where it is done automatically by a Thury regulator between the limits of 80 and 125 r.p.m. (3) The power factor of the load on the generating plant could be improved. (4) Owing to the fact that only one 500 kw. rotary converter would be required at first for the two motors the initial cost was moderate. (5) The 3,000 volt and 500 volt transformer for the A.C. side of the rotary would act as spare to the existing transformer, which is used for small A.C. motors. (6) Any surplus current from the rotary converter became available for a variable-speed D.C. motor drive, such as the induced-draught fan motor, or for any other drive when variable speed is required. (7) A comparatively slow-speed air compressor could be used with a direct-coupled motor.

Mr. Hann pointed out that the general experience at collieries where mixed-pressure electric-power plants have been installed, and where the colliery is so situated that its supply cannot be linked up with other collieries, has been that, owing to the large fluctuations in the amount of exhaust steam available and the current demand, it has not been possible either to utilise fully the exhaust steam or to obtain a satisfactory load factor. The installation at Bedwas was designed to get over this difficulty, and, with the choice of electric drives available, Mr. Hann thinks that a high load factor will be realised, and that the exhaust steam should be almost completely utilised.

It was also mentioned in the Paper that, in order to cope with an inrush of water into a district at the rate of about 10,000 gallons per hour, which gradually reduced to 4,000 gallons per hour, two sets of Sulzer centrifugal electric pumps, each capable of delivering 560 gallons per minute to the surface, were ordered. The total manometric head against which these pumps have to throw is 2,507 ft. This required the employment of thirteen stage pumps, each set consisting of a five-stage and an eight-stage pump, coupled in series, with a combined bed-plate to take also the electric motor, which is placed between the pumps.

## AN ELECTRIC WINDING ENGINE IN SCOTLAND

AT a meeting of the Mining Institute of Scotland on October 11th, Mr. W. M. Dunn read a Paper on the electrical winding plant which has been installed at the South Kennmuir Colliery. When the reopening of this pit was under consideration, it was found that the space was too limited to put in a steam winder easily, and that electric power could be obtained at a reasonable figure from the mains of the Clyde Valley Electric Power Co. Careful estimates were made of the relative costs of steam and electric winding, and finally an electric plant was ordered from Crompton & Co. (Chelmsford). The winder is capable of winding 720 tons per shift, or 180,000 tons per annum from a depth of 76 fathoms, at the following estimated costs:—Wages of three enginemmen, £373; oils, waste fuel, &c., £9 14s. 5d.; winding minerals, men and stores, £362 10s.; depreciation (5 per cent. on £2,460), £123; difference between first cost of steam and electric winder (5 per cent. on £825), £41 5s.: giving a total of £909 11s. 5d., equal to 1'213 pence per ton. The time taken to wind 17cwt. from the 76 fathom level is twenty-four seconds plates to plates, and with ten seconds allowed for banking; the winder, if kept running without a halt, is capable of raising 720 tons from that depth in eight hours.

The winder is on the continuous-current system of Messrs. Crompton & Co., without flywheel storage, and the winding motor, which is direct-coupled to the drum, receives current at a variable voltage from a motor-generator of special construction driven by a three-phase motor from the supply circuit. The safety devices are as follows:—An electromagnetic brake comes into action automatically either when the controller cuts off the current or when the limit switches are reached. Immediately after the limit switches are passed, mechanical trips on the indicator column release a weight which applies the post brake. This same weight is also released by a solenoid in event of the current failing. The controller is so arranged that the normal acceleration cannot be exceeded, even if the handle is put hard over. The control was found to be very easy, and there was no difficulty in training ordinary enginemmen to work the winder.

**Electricity in Mines in New South Wales.**—The annual report for 1912 of the Department of Mines, New South Wales, notes the advisability of having a duplicate drive for ventilation fans. A non-fatal accident is recorded in which a sinker received a shock owing to the winding rope of the sinking winch becoming alive through an unearthed defective controller. A horse-driver was prosecuted and convicted under the electric special rules for baring an electric cable and connecting it to a chain fence on which a filler was sitting. He was rendered unconscious for a considerable time. No fatal accidents due to electricity occurred, and but little of electrical interest is recorded.

**Collieries and Electricity.**—In the course of his address to the Yorkshire Branch of the Association of Mining Electrical Engineers at Sheffield on October 25th, Mr. H. C. Jenkins looked forward to the time when each colliery would become a huge generating station, from which electrical energy would be distributed. It was important, he also said, that members of the Association should broaden their knowledge of electricity as much as possible, because at all mining disasters the first question was whether electricity installed underground was the cause. Electricity was made the scapegoat wherever possible, and it was the duty of the mining electricians to disprove this charge. Mr. J. Bentham (New Sharlston Collieries) gave a paper on testing transformers for colliery work.

**Association of Mining Electrical Engineers.**—At the annual meeting of the Association of Mining Electrical Engineers, which was held in Birmingham, the retiring President, Mr. W. C. Mountain, said that they now had 1,081 members of the Association. The Association and especially the certificates granted by it were now being regarded as things of value. In the past electrical machinery in collieries had suffered a great deal from the fact that the class of men who looked after it were incompetent. That, however, was being got over, and the present class of men were a great improvement. Mr. A. Anderson was elected president for the ensuing year, Messrs. A. Hall and R. Holliday vice-presidents, and Mr. C. F. Jackson treasurer. In the course of his address Mr. Anderson expressed the opinion that the day of the mining engineer with only a little elementary electrical knowledge was gone. He foresaw a steady development of the use of electricity as an aid to mining, and the average underground distributing station would compare badly with that of the future when they might expect to see well-made walls, and clean and even floors. He advocated a thorough course of technical training for young men entering the profession. Unreliable plant was often the outcome of unreliable attention due to lack of technical knowledge. He deplored the lack of first-class men at the present time.

## HOME OFFICE PROSECUTION

EVIDENCE in the case against the agent and the manager of the Dalzell & Broomside Colliery, Motherwell, with regard to alleged contravention of the Coal Mines Act, mentioned in *ELECTRICAL ENGINEERING*, October 2nd, page 556, has been continued since our last report. The charges included failure to have certain fuses properly protected, failure to cover parts of certain unarmoured cables with insulation, and failure to secure certain cables with readily breakable non-conducting material, failure to keep signal wires away from cables, failure to earth a gate end box, and failure to provide a suitable trailing cable to a coal-cutter. There were other charges of a non-electrical character. Mr. Robert Nelson (H.M. Electrical Inspector of Mines), spoke of having seen a distribution box containing fuses not so constructed as to prevent risk of shock. In some of the cables the insulation was quite worn away in parts, and in some places the cables rested on nails instead of being secured in proper slings; also in one of the gate end boxes, the earth-conductor was not soldered into a lug for the earth connection, and the trailing cable of a coal-cutter was not connected to the system by a properly constructed connection. Mr. Nelson's evidence was corroborated by Mr. W. Walker (H.M. Chief Inspector of Mines for Scotland).

For the defence, Mr. G. L. Kerr (Inspector for the Scottish Mine Owners' Association), said that, from his reading of the regulations, the fuses in the distribution box were exempt under the Act, and Mr. D. Martin considered that there was no risk of shock with reasonable care; but admitted, in cross-examination, that there was a possibility of live contact. The installation of a box, as suggested by the inspectors, and the replacement of the trailing cable connection, would have involved new apparatus, which would have come under the clause of the Act, which allowed an extension of time for its installation. The suspension of the cable on nails was a temporary expedient until suspenders were obtained. He thought that it was the electricians' duty to detect absence of covering on the cables. The manager (Mr. J. Dalgleish), in his evidence, urged that he was taking all reasonable means to get everything up to the requirements of the Act, and complained that he could not get experienced men to carry

out the work in the specified time. The agent (Mr. R. W. Dron) was satisfied that the manager was doing all he could to meet the requirements of the Act. His own position was that of an outsider giving technical advice. Sheriff Shennan, in his judgment, first took up the question of the position of the agent, and, finding that he was a skilled adviser without power to issue orders, dismissed the complaint as against him. With regard to the charges against the manager relating to the electrical rules, the sheriff finds that the rule on which the charge relating to the fuse-box is founded relates to construction, and accordingly Rule 20, allowing extension of time, applies. It would have been simple for the inspector to require that matter to be remedied in virtue of his powers under Rule 20. In any case, he regards it as the duty of the electrician rather than the manager to inspect the fuses minutely. The charge of failure to cover cables with insulation he regards as more serious, and convicts on this count. The four remaining charges are characterised as relating to matters of detail for which the manager could not be held responsible, and are dismissed. The sheriff convicted on some of the non-electrical charges, but, remarking that he did not regard any of the offences as serious, he imposed a fine of £5. It will be remembered that the electrician to the colliery was originally included in the charges, but it was decided that he could only be proceeded against for failure to examine the plant properly. To this he pleaded guilty at a subsequent hearing, and was fined £2.

## ELECTRICAL MINING AND METALLURGICAL PATENTS OF OCTOBER

## Mining.

THE following Specifications published by the Patent Office during October are of particular interest to mining electrical engineers. In No. 20,352, of 1912, F. Farber, a safety lamp is described. It comprises a strong metal cylinder forming the base and battery container, while the lamp-head is secured by a bayonet fastening, and is magnetically locked. The battery is maintained central by a ridge engaging with a slot in the base, and loosely mounted spring plunger contacts bear against the lamp-head. The circuit is made or broken by turning this head. The lamp is held between two concentric contact springs, and is pressed against them by a third co-axial spring. The accumulator elements are mounted on the lid of the cell, and the lid is fixed to the cell by a thin strip of celluloid. Specification No. 22,738, of 1912, by W. H. Hanson, H. L. Langston, and the Electrical Power Storage Co., Ltd., also deals with a safety lamp in which control of the light is effected by movement of the head. An airtight space is provided between the base-plate and the lamp and the cover of the battery casing. An airtight joint is made by a V-shaped circular projection on the former engaging a groove in the latter. The lamp chamber, which contains more than one lamp, is connected to the cover of the battery casing by a central bolt. In Specification No. 24,438, of 1912, O. Oldham (Denton, Manchester) describes a construction of internal switches to effect control of the light by rotation of the lamp-head. A bottom cap is free to screw up and down in the lower end of the case to a limited amount, and to support and turn the battery with it. Specification No. 4,707, of 1913, by T. Heaton, deals with a gas detector for miner's safety lamps, and is an improvement on the lamps covered by Patent No. 239, of 1912. A platinum or nickel-chrome wire is supplied with current from the accumulator, and the heat evolved is arranged to volatilise oil in a container, which is ignited in the presence of fire-damp. Either the detector or lamp may be used by turning the head which is provided with an ordinary miner's lamp top. Specification No. 1,407, of 1913, by Friedr. Krupp, A. G., of Essen, Germany, deals with the control of machines on the Leonard system. The main field of the dynamo is separately excited. It is connected in parallel with the armature by a potentiometer arrangement. By means of an auxiliary brush only part of the armature pressure need be

CABLE  
CO., LD

DAGENHAM DOCK,  
ESSEX.

applied to the potentiometer circuit. Another specification relating to hauling and winding sets is No. 11,007, of 1913, by Siemens-Schuckert. The supply to the set is regulated by means of an automatic speed regulator, which, during the acceleration of the working motor, driven by the Ilgner set, is set higher, and during retardation is set lower, so as to produce a more gradual acceleration of the flywheel. The sensitiveness of the speed governor is adjusted by a load or current relay. The speed governor described in Specification No. 27,588, of 1911, is specially referred to.

### Metallurgical.

The following Specifications are of particular interest to electrometallurgists:—In No. 21,263, of 1912, by the B.T.-H. Co., to which it was communicated by the General Electric Co. of America, the control of A.C. induction motors for use with three-high rolling mills, &c., is dealt with. Two motors are used, one has about twice the synchronous speed of the other, both are geared to the lifting table, and are controlled by a circuit changing limit switch. An automatic reversing switch is also provided for the high-speed motor. The operations are as follows:—The high-speed motor starts and accelerates the table; it is then cut out, and the low-speed motor is cut in, and is driven by the momentum above its synchronous speed, so that it acts as a generator, and retards the speed of the table. Just before the low-speed motor has reached synchronous speed, the high-speed motor is cut in again in a reversed direction, and the two motor torques tend to balance at about one-quarter full high speed. The table is then stopped by a solenoid brake.

In Specification No. 24,626, of 1912, the Morgan Crucible Co. and C. W. Spiers describe a conducting crucible for tilting furnaces. The upper part is made with an annular extension, so that it may be clamped up to form one of the terminals, the other being at the bottom as usual. The extension is made of larger cross-section than the body of the crucible, so that it is not so greatly heated. In Specification No. 16,011, of 1913, J. Bally describes a design of transformer furnace in which the secondary circuit consists of vertical or inclined holes connected by horizontal conduits or solid connections. These are situated on one cylindrical surface or several concentric cylindrical surfaces. In the

interior is the primary, which is made up of several coils arranged radially on a central axis. Several advantages are claimed for this construction. The magnetic body may be used for binding the insulating material; a long secondary circuit, automatic filtration of the bath, and collection of the scum in certain holes; heating centres well distributed, and a single ventilation shaft for the primary coils only is required. The primary may be readily withdrawn, so that any repairs to the working chambers are easily effected.

**Telephones in Rescue Work.**—After the overcoming by gas of one of the rescue parties in the Universal Pit at Senghenydd, telephonic communication was established between the rescue parties and the colliery offices over a distance of a mile. This was done by means of Army field telephones and a reel of cable, with other apparatus, lent by the Welsh Telegraph Company, Royal Engineers. The men were then able to carry portable telephones, and to remain in touch with the surface.

**Fatal Accident due to Electric Shock.**—An inquest was held recently into the death of a coke-oven ram-driver named George Smith at the works of the Coppee Co. (Great Britain), Ltd. Electrical power was supplied by the Pinxton Colliery Co., who saw to the keeping in order of the wires and cables, lamps, &c., but no systematic examination was made. It was shown that Smith's death was due to shock from touching a handrail which had become alive from the cable in an adjacent faulty conduit during wet weather. No blame was attached to the management.

**Electric Safety Lamps in Mines.**—In the course of a speech at West Kirby recently, Sir Arthur Markham urged that the use of electric safety lamps should be made compulsory in all mines, even where naked lights were now used. An electric light, he said, gave much more light than a candle, and was far safer than an oil lamp. Men who used electricity said there was no comparison between that and the oil safety lamp, and they would have nothing more to do with oil. The cost on the industry to "scrap" the oil lamps and to buy new ones for electricity would be about one million sterling, but the added safety would be worth the expense. If this last disaster were proved to be due to a defective safety lamp, then it might be that Parliament would compel the use of electric lamps as an additional precaution in mines. As far as he was concerned, he was going to put electric lamps into every pit with which he was connected.

# THE GLASGOW ELECTRICAL EXHIBITION

## Second Notice

WE give below some further notes on the Glasgow Electrical Exhibition, including descriptions of some stands not mentioned in our last issue.

We are now able to give an illustration of the stand of the Edison and Swan Electric Light Co., which was described last week.

On the Stand of The General Electric Co., Ltd. (71 Waterloo Street, Glasgow), will be found a large selection of Osram lamps from 2 to 1,000 candle-power. The firm have recognised the large demand for small heating and cooking appliances, such as electric irons, kettles, saucepans, toasters, radiators, &c., and are showing a varied range of their well-known "Magnet" type of apparatus. Amongst these perhaps the most popular are the domestic types of electric iron, the 4 lb. size of which is sold for 12s. 6d., and the 6 lb. type at 16s., with guarantees for three years. They are highly finished and nickel-plated, and at Glasgow rates they cost only 1d. for nearly four hours' continuous use. A neat little 2 pint copper "Magnet" kettle is also shown that will boil 2 pints of water in 7 minutes. There are also on view a breakfast set consisting of hot plates, chafing dish, teapot and coffee percolator. The General Electric Co. also show a varied collection of telephones to meet all requirements, from the small battery telephone to the latest model central battery lamp signalling switchboard. Examples of "Superlux" glass are also on view.

At Stand No. 47 R. Waygood & Co., Ltd. (Falmouth Road, London, S.E.), show a working model of an automatic electric passenger lift, with push button control, and gates fitted with interlocking gear. For the purpose of the model the floor pushes

THE EDISWAN STAND.

that would ordinarily be in the cage are placed outside, so that the working of the lift may be easily demonstrated.

An excellent selection of electric cables of all types and for all purposes are shown at Stand No. 49 by W. T. Henley's Telegraphs Works Co., Ltd. (Blomfield Street, London, E.C.). There is also a varied selection of joint boxes, jointing material, Henley Patent Cable Suspension, and other accessories. The Henley wiring system is explained, and samples of the work are shown.

The Record Electrical Co., Ltd. (Caxton House, Westminster, S.W.), are exhibiting a variety of measuring instruments and automatic circuit breakers. The pedestal iron-clad type of ammeters and voltmeters shown are very suitable for factories, shipyards, and exposed positions. The patent "Circscale" instruments are on view, and some models are connected up to demonstrate the instruments under working conditions.

Besides showing several small hand vacuum cleaners The Scottish Vacuum Cleaner Co. (111 Bothwell Street, Glasgow), are exhibiting the "Santo" Vacuum Cleaner, and their later production, the "Ruby." By a special pump in this cleaner fully 10 in. of vacuum, and an air volume of fully 33 cubic feet of free air per minute is obtained. This ensures a strong blast of air for use with the blowing hose, which removes dust from corners and crevices where it is not possible to apply the suction. There are also being given demonstrations of the "Perfection" Vacuum Clothes Washer, which has proved so effective.

The British Electric Plant Co., Ltd., Alloa, are exhibiting at Stand No. 39 several of their well-known specialities in con-

nection with colliery equipments. They make a speciality of high and low lift turbine pumps, in which it is claimed that the end thrust is neutralised at each impeller, and consequently no balance pistons of any description are required. In this connection they are showing one of their D4 size pumps, direct coupled to one of their special A.C. motors, which is very compact and specially adapted for colliery work. The output of the system is 400 gallons of water per minute against 300 feet head when running at a speed of 1,500 r.p.m. The Company have also developed turbine pumps for boiler feed purposes, and one of their C7 size pumps represents this type coupled to one of their standard D.C. motors, the pump having an output of 150 gallons per minute against 200 pounds pressure. A complete set of pump impellers are shown mounted on the shaft, a unique feature being that the whole shaft where it comes into contact with the liquid is protected by bronze sleeves. A new design of D.C. motor is also on view, suitable for pipe ventilation, also a 20 h.p. single drum haulage, fitted with new mining type D.C. motor, with drip-proof cover.

The Skefko Ball Bearing Co., Luton, are showing at the stand of Mr. David Martin (45 Hope Street, Glasgow) their well-known bearings under running conditions, fitted to a badly bent shaft. The great success of these bearings can be understood from the fact that over 8,000 employees are engaged in their manufacture. It is claimed that they are the only self-aligning ball bearings made where the rolling motion is solely on the balls. The hardened steel balls run on a spherical-shaped seat, so that when shaft flexure develops the race self-aligns to the new conditions without injuring. It is claimed that friction is reduced by over 90 per cent., while skewed bearings are entirely eliminated, thus reducing lubricating costs. Messrs. A. Reyrolle, Hebburn-on-Tyne are also showing at this stand some of the lighter class of switchgear in which they specialise.

The British Electric Co., Ltd. (73 Dunlop Street, Glasgow) show a selection of their water heaters of the geyser and tank types. With the geyser type it is possible to obtain a supply of hot water in five seconds from any water main, the cold water being filtered and the hot water sterilised. The applications of the circulating or tank system for ship and railway carriage purposes are shown. The tank is contained in the fitting, and by a reliable automatic arrangement the heating element is switched on when the temperature of the water drops as hot water is drawn away, thus continuing a constant supply. For boiling water in thirty seconds this firm show a compact and serviceable apparatus, and there are also on view electrically-heated towel-rails and electrically-heated bath tanks.

The Carron Co. (Carron, Stirlingshire), who were pioneers in the progress of kitchen ranges and gas fires, have a splendid exhibit on Stand No. 72. From their works at Carron they have turned out electrical cooking and heating appliances of most useful, modern, and durable design. These include cookers, ovens, grillers, hot-plates, toasters, boilers, radiators, and convectors, all fitted with their special heating elements fixed to a fireclay base. The electrical appliances shown on this stand will maintain the Carron Co.'s high reputation for the manufacture of only the finest goods in their trade.

The Electrical Contractors' Association (Glasgow Branch) have a stand (No. 61) which is occupied by a combination of eighteen local contracting firms, who are displaying a comprehensive range of electrical accessories and novelties. The stand is attractively arranged, and a fine collection of suspended fittings for domestic lighting have been brought together, including Georgian and Jacobean designs. An assortment of shop fittings and brackets are also shown, with a selection of grills, cooking ovens, and heating apparatus, including an electric incubator.

**Physical Society's Exhibition.**—The annual exhibition promoted by the Physical Society of London will be held during the afternoon and evening of Tuesday, December 16th, at the Imperial College of Science, South Kensington.

**The Circle Diagram of the Polyphase Induction Motor.**—A Paper entitled "The Efficiency of the Polyphase Induction Motor from the Current (Circle) Diagram; together with an Equation connecting the Output and Input of the General Electric Circuit," by Mr. J. S. Nicholson, has been published in the current *Journal of the Institution of Electrical Engineers*. A previous Paper on the same subject was published in Vol. 49 of the *Journal*. The Author reduces the induction motor to an equivalent electric circuit and an approximately equal equivalent circuit, and from these he draws circle diagrams. The details of tests are given to show that the method gives very accurate results. The form of diagram dealt with is that due to Ossanno, Bragstad and La Cour, and others. The effects of altering the resistance and other constants are easily seen, and have been checked by experiments, the results of these being given.

### AN ACCUMULATOR TRUCK FOR POST OFFICE WORK

**A**MONG the many types of industrial vehicles which are being introduced by Edison Accumulators, Ltd. (49 Old Bond Street, W.), is the very convenient truck for post office and general parcel work, which we illustrate here. This truck was designed to carry a load of 10 cwt., plus driver, at a

EDISON ACCUMULATOR TRUCK FOR POST OFFICE SERVICE.

speed of five or six miles an hour, and to travel twelve miles on one charge. In point of fact, on trial a speed slightly in excess of requirements was realised, and the truck will travel on level wood pavement a distance of 26 miles on one charge. This represents a ton mileage of about 34, or a battery output of about 110 watt-hours per ton mile. The accumulator equipment consists of forty Edison cells B-4 type, giving 4 kw.-hours at 45 volts. The 1-h.p. motor is series-wound and totally enclosed, and is capable of withstanding severe overloads. Some idea of the powerful torque available may be gained by the fact that the truck on trial ascended a gradient of one in five fully loaded and with a battery equipment only half the size of that ultimately fitted. The transmission is by means of a bevel-driven enclosed ball-bearing rear axle. The controller is designed with a special view to preventing accidents when the vehicle is in the hands of comparative novices, and is interlocked with an electric brake. A further internal expanding brake is provided on the rear hubs. The platform is 5 ft. 8 in. long and 3 ft. 6 in. wide, the over-all height being 4 ft. The accumulator is carried amidships—under the floor-boards—where it is easily accessible to enable occasional additions of distilled water to be made to the cells, this being, in fact, the only upkeep that the Edison accumulator entails. Satisfactory tests have been made at Bristol and Birmingham by the Post Office officials, and although future models of this truck may be improved in some minor details, it has already been demonstrated that a considerable field of utility lies before small industrial accumulator trucks of this type.

### A TUNGSTEN TRACTION LAMP

**T**HE Edison & Swan United Electric Light Co. (Ponders End, Middlesex) send us the accompanying illustration of their Royal Ediswan traction lamp with wire drawn metal filament. It is made with the popular small pear-shaped bulb, and the filaments, having only short unsupported lengths, are very rigid and withstand vibration well. Particular care is taken in the selection of lamps for series running. The same pattern of lamp is well adapted to ship, mill and mine lighting.

### A GLOWING RADIATOR

**T**HE illustration below represents a new design of heater marketed this season by the Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex). It is

OXIDISED SILVER GLOWING HEATER.

finished in oxidised silver and fitted with two switches, twelve glowers, and two yards of flexible. The full-on consumption is one and a half units.

### AN ELECTRICALLY-DRIVEN FIRE PUMP

**T**HE illustration shows an electrically-driven "Hatfield" pump which has just been installed by Messrs. Merryweather & Sons, Ltd. (Greenwich Road, S.E.), for fire protective purposes, at Balcombe Place, Sussex, which is one of Lord Cowdray's country seats. The pump is capable of delivering 300 gallons per minute, and is driven by an electric motor through spur reduction gearing. It draws its supply of water from a pond in the grounds, and delivers into a fire-main installation with hydrants at various points. The

ELECTRICALLY-DRIVEN FIRE PUMP.

pieces, each carrying an air vessel, are bolted to the suction and delivery flanges of the pump. A sluice valve and cast-iron bend are connected to the suction tee piece, and the delivery tee piece has a flange for the cast-iron bend, and also a flange for taking a spring loaded relief valve. The relief valve, which is not shown in the illustration, is provided so that in the event of the hydrants being shut down while the pump is at work no damage would be caused to the pipes. Being electrically driven, the pump can, of course, be instantly started, and will permit of a powerful jet being brought to bear on a fire in the shortest possible time.

### QUESTIONS AND ANSWERS BY PRACTICAL MEN

#### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

#### QUESTION No. 1,363.

An Otis elevator designed to lift 2,000 lb. is used for passengers only, and at times, with only two or three persons on, will not travel at more than half speed. At other times, when the car is run down to the limit switch, the potential switch will drop off. A short time ago, whilst the car was on its downward journey (with six persons on), a sudden drop of about two feet was experienced, and on examination the rope was found to have dropped over the side of the drum. What is the cause of slow running? Why did the rope drop off the drum?—C. W. A. (Western Australia).

(Replies must be received not later than first post, Nov. 13th.)

#### ANSWERS TO 1,361.

If a 60-light 3-storey house were to be wired on the "tree" system, but utilising screwed barrel, modern connection boxes with porcelain interiors, and also specially designed continuity iron fuse boxes, why would it still be incorrect practice?

The first award (10s.) is made to "M. M." for the following reply:—

Provided the installation be arranged for a definite demand and that neither this demand is exceeded on the original circuits nor any further additions made, the "tree" system can be made safe. If, however, any additions are made to the work on the installation, all fuses on the supply side of such additions should be proportionately increased. In one way the tree system cannot possibly be correct; that is, that any addition is bound to cause an increase in the drop in all conductors carrying current to such addition. Generally, the tree system is wanting in flexibility, and is not adapted for general conditions.

"F. T." to whom the second award (5s.) is made, writes:—

An installation wired on the "tree" system necessitates a long run of wiring which is only controlled by the main fuses; consequently there is a much greater possibility of a fault operating these fuses, and putting the whole installation in darkness, than if wired on a modern distributing board system. Further, the "tree" system does not comply with the wiring rules of the Institution of Electrical Engineers, which are now adopted by the leading Fire Insurance Companies and Electrical Supply Authorities throughout the country. Rule 23 reads that "Conductors must radiate from distributing centres, and in large systems from those centres to sub-centres."

Although the above are the best two answers received, both omit two of the chief reasons why the "tree" system is incorrect practice. One is that the fuses may have to be

scattered all over the building (wherever a branch is taken off or the wire reduced in section), and the other that the tree system, when modified as the question implies, would actually be more costly to put in than a modern distributing board and looping-in installation with the same quality of workmanship.

### THE INSTITUTION OF ELECTRICAL ENGINEERS

THE opening meeting of the Institution of Electrical Engineers will be held on Thursday, November 13th, when the President, Mr. W. Duddell, F.R.S., will give an experimentally illustrated address on "Pressure Rises," and premiums will be presented.

The following further London meetings are announced:—November 27th: Paper by Mr. S. Evershed on "The Characteristics of Insulation Resistance"; December 4th: Address by D. G. Klingenberg on "Electric Supply in Large Cities"; December 18th: Paper by Mr. H. C. Gunton on "The Employment of Power in H.M. Post Office"; January 8th: Paper by Mr. H. R. Speyer on "The Development of Electric Power for Industrial Purposes in India"; January 22nd: The Fifth Kelvin Lecture by Sir Oliver Lodge. Papers on the following subjects are also in preparation:—"Some Railway Conditions governing Electrification," "Electrification of Railways as affected by Traffic Considerations," "Difficulties of the Electrification of existing Termini and Goods Yards, and the effect of existing Rolling Stock on the Main Line Electrification Problem," "Generation of Electrical Energy for the Purposes of Main Line Traction," "The Design of Traction Motors for Alternating and Continuous Currents," "Rolling Stock and its Design and Influence on the Energy Consumption of Trains," "Electric Locomotives," "Electric Signalling on Railways," also a Discussion on Battery Vehicles.

#### BIRMINGHAM LOCAL SECTION.

The following meetings are announced:—Nov. 12th, Paper by Mr. S. H. Holden on "The British Standard Specification for Consumers' Meters"; Nov. 26th, Mr. Evershed's Paper on insulation will be discussed; Dec. 10th, Discussion on the rating of electrical machinery, introduced by Mr. A. R. Everest; Jan. 7th, Mr. Speyer's Paper on electric power in India will be discussed; Jan. 28th, Discussion on "Means for Securing the Further Employment of Electricity for Domestic Purposes (Rates, Publicity, and Apparatus)," or alternatively a Paper by Dr. T. F. Wall on "The Theory of the Three-phase Synchronous Machine."

#### DUBLIN LOCAL SECTION.

On Nov. 14th, Mr. G. M. Harriss will deliver his inaugural address.

#### MANCHESTER LOCAL SECTION.

Nov. 18th, Paper by Mr. H. H. Perry on "A Two-rate Tariff System without Time-operated Control"; Dec. 2nd, Mr. Evershed's Paper on insulation will be discussed; Dec. 16th, Mr. Gunton's Paper on "Power in the Post Office" will be discussed; Jan. 13th (probably), Paper by Mr. T. Ferguson on "Train Lighting"; Jan. 27th, Paper by B. Welbourn on "British Practice in the Construction of High-tension Lines."

#### NEWCASTLE LOCAL SECTION.

Nov. 10th (at Newcastle) and Nov. 14th (at Middlesbrough), Paper by Mr. J. W. Jackson on "Steam Boiler Working in Electrical Power Stations"; Dec. 8th (at Newcastle) and Dec. 12th (at Middlesbrough), Dr. Klingenberg's address on "Supply in Large Cities" will be discussed; Jan. 12th (at Newcastle) and Jan. 16th (at Middlesbrough), Paper on "Inductance and Induction Coils in Industrial Work."

#### SCOTTISH LOCAL SECTION.

Nov. 11th (at Glasgow), Mr. J. A. Robertson's inaugural address; Nov. 18th (at Edinburgh), Dr. Klingenberg's address on "Supply in Large Cities" will be discussed; Jan. 13th, Mr. Gunton's Paper on "Power in the Post Office."

#### WESTERN LOCAL SECTION.

Dec. 1st (at Cardiff), Mr. Evershed's Paper on insulation will be discussed; Jan. 19th (at Bristol), Mr. Gunton's Paper on "Power in the Post Office" will be discussed.

#### YORKSHIRE LOCAL SECTION.

Nov. 6th (at Leeds), Mr. W. B. Woodhouse's inaugural address; Dec. 10th (at Leeds), Mr. Holden's Paper on meters; Jan. 14th (probably), Mr. Perry's Paper on tariffs.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published October 30th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**  
**22,524/12. A.C. Rectifiers.** W. A. PRICE. To convert single, two, or three phase current to direct current, or *vice versa*, combinations of condensers and inductances are used, and the switching is controlled by a synchronous commutator. The condenser is inserted across the switch, which finally breaks the circuit, and the other side of a main switch is an inductance and resistance in parallel. Eleven figures.

**22,548/12. Drawn Tungsten Filaments.** POPE'S ELEC. LAMP Co. (C. Trenzen, Germany). The filaments are drawn from a sintered mixture of tungsten and thorium, or some of its salts, in the cold and without previous mechanical treatment. The resistance of the filament is 20 per cent. less than the resistance of a similarly made pure tungsten filament.

**22,649/12. Signalling and Apparatus Control over Supply Mains.** A. C. BROWN. High-frequency currents are made by a rapid make-and-break contact, connected one side to the mains and the other to earth through a condenser, and also to another wire of the mains at a different potential through a resistance or inductance. The oscillations are received by two inertia contact relays, one actuating the other and magnifying the received oscillations. Six figures.

**23,082/12. Cooking Apparatus.** R. F. VENNERS. The heating element consists of a resistor surrounded by a horizontal layer of a liquid insulator, such as oil, of a large area and small uniform thickness enclosed in a chamber with cavities to take up expansion. Three figures.

**23,451/12. Vulcaniser.** H. R. NASH. Vulcanising at atmospheric pressure is effected by immersing the articles to be treated, which are protected by a wrapping, in a bath of oil in an open vessel electrically heated by resistances. The article is kept from the resistor by wooden cleats. Two figures.

**23,594/12. Motor Control System.** B.T.-H.Co. (G.E.Co., U.S.A.). The motor, particularly for machine-tool driving, is rapidly stopped by dynamic braking, even with a weak field. The switchgear consists of a relay energised by the braking current for short-circuiting resistance in the braking circuit, and a differential electromagnetic holding-out device, having its windings across the supply and in series with motor field. Thus the relay closes as the field nears full strength. One figure.

**28,122/12. A.C. Flame Arc Lamps.** B.T.-H.Co. (G.E.Co., U.S.A.). The lamp is fed from an auto-transformer which is normally unsaturated, but when the arc resistance exceeds a certain amount, it becomes saturated, and cannot supply the energy to maintain the arc, which is therefore extinguished and then re-made by a series magnet in the secondary circuit of the auto-transformer, which actuates the electrode feed. One figure.

**28,227/12. Motor Meters.** B.T.-H.Co. and F. HOLDEN. To prevent the constant of the instrument from varying with the temperature, the meter drives a friction disc, while a second disc is connected through gearing with the registering train. The axes of these discs are parallel but out of alignment. Motion is transmitted from the first to the second disc through a friction wheel carried by a bi-metallic strip, which moves the friction wheel radially owing to unequal expansion of its constituents with the temperature. Four figures.

**735/13. Control of A.C. Motor Systems.** J. D. ROUTIN. The invention is particularly adapted for the control of gun mechanism on warships. A number of asynchronous motors have their stators and rotors connected in series, and the stators may be fed with single or three-phase current from an alternator provided with switch mechanism for this purpose. The rotors are automatically connected to a three-phase rheostat when three-phase current is being supplied. When supply is stopped, the short-circuiting produces a powerful braking. Two figures.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free. Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** CASE [Motor control] 27,837/12; HUNTINGDON [Cable suspenders] 2,449/13; SIEMENS-SCHUCKERT [Circuit protection] 6,164/13; ORINSCHNIG [Insulators] 18,755/13.

**Dynamos, Motors, and Transformers:** B.T.-H. Co. (G. E. Co., U.S.A.) [A.C. commutator motors] 20,849/12; VEDOVELLI, PRIESTLEY ET CIE. [Small power transformers] 4,090/13; CONRAD [Vapour rectifiers] 12,471/13; ELLISON [Protection of A.C. motors] 12,710/13; OTIS ELEVATOR Co. (Otis Elevator Ges.) [A.C. magnets] 13,315/13; EICHERT [Regulation of the efficiency of variable-speed dynamos] 17,922/13.

**Electrometallurgy and Electrochemistry:** SULMAN, PICARD and BROADBRIDGE [Nitrates] 23,591/12; MARKS (Hooker Electrochemical Co.) [Electrolytic cells] 12,208/13; WAGNER [Electrolytic diaphragms] 16,048/13.

**Heating and Cooking:** BERRY [Heaters] 23,860/12.

**Ignition:** O'FLAHERTY [Magneto driving] 25,531/12; RENOUF [Ignition of motor vehicle lamps] 29,453/12; RUTHARDT [Timing] 12,871/13; SOC. GÉNÉRALE DES HUILES ET FOURNITURES INDUSTRIELLES L'OLEO [Spark plugs] 18,753/13.

**Incandescent Lamps:** BEUTTELL [Lamps and holders] 23,774/12; CHÉRON, DOMINICI and BIQUARD, 13,822/13.

**Switchgear, Fuses, and Fittings:** LAKE (Soc. Anon. Du Temple) [Motor controllers] 23,669/12; DAMEY [Incandescent lamp reflectors] 27,276/12; B.T.-H. Co. (G.E. Co., U.S.A.) [Switches] 29,842/12; HORNE [Switches] 764/13; RHODUS [Rheostat] 4,131/13; LÉDERS [Lamp pendants] 5,228/13; YOUNG [Switch movements] 5,321/13.

**Telephony and Telegraphy:** BROWN [Relays] 24,043/12; NICOLSON [Intensification of intermittent electromagnetic impulses] 24,136/12; GRAHAM [Telephony] 2,022/13; MARX [Telephone attachment] 4,502/13; SIEMENS BROS. and PETTIGREW [Selective telephone exchanges] 7,128/13; SIEMENS & HALSKE [Telephone circuits] 7,130/13; SIEMENS BROS. and LAIDLAW [Telephone instrument sets for two lines] 9,167/13; GARDNER and FERGUSON [Impulse transmitter] 13,793/13.

**Traction:** GATH [Control of motor-operated points] 23,279/12; ANGUS [Signalling and train control] 6,329/13.

**Miscellaneous:** BEUTTELL [Illuminated signs] 22,990/12; BOOTH and WILKINSON [Motor vehicle lamp indicator] 23,211/12; MARLOR, HANN and FOSTER [Conduit cutters] 23,607/12; J. PINTSCH A.-G. [Driving vehicle lighting dynamos] 23,854/12; GALE [Organs] 24,142/12; GRÜNDEL [Indicator or signal with advertisements] 28,349/12; MARTIN and NIXEY [Signs] 5,637/13; NATHORST [Magnetic separators] 8,485/13; KRAUS [Electrostatic grit or grain separator] 14,587/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, &c.:** STORER [Regenerative braking system] 21,140/13; [Motor control systems] 22,390/13.

**Switchgear:** VON MERKL [Automatic speed regulation of direct electrically-driven machine tools] 14,259/13.

**Telephony:** SIEMENS & HALSKE [Automatic] 22,850/13.

**Miscellaneous:** SOC. ANON. G. ANSALDO & Co. [Remote control of ships' propeller turbines] 19,743/13.

The following Amended Specification may now be obtained.

**Switchgear, &c.:** H. D. EARL [Automatic regulator for variable speed dynamos] 12,871/12.

## Application for Amendment

19,948/11. **Synchronous Rotary Spark Gap Transmitters for Wireless.** L. ROUZET. The patentee has applied for leave to amend the claims so as to define the invention more precisely and also to add explanatory notes to the description of the invention. The specification was abstracted in ELECTRICAL ENGINEERING, Oct. 10th, 1912, p. 564, Vol. VIII.

## Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** VERITYS and F. S. WORSLEY, 14,982/08.

**Heating and Cooking:** W. E. SANDER [Resistors for heaters or incandescent lamps are made from thorium, zirconium, uranium, &c., or their compounds; the filaments when made are mounted in bulbs containing nitrogen or hydrogen, &c.] 14,411/01; G. and L. FULLER [Electrolytic water-heater: current flow reversed each time used] 14,817/08.

**Incandescent Lamps:** W. NERNST and L. STOCKEM [Nernst glowers] 15,915/06; WESTINGHOUSE METAL FILAMENT LAMP Co. (Westinghouse Metallfaden Glühlampen Fabrik) [Squirted filaments] 14,942/08.

**Instruments and Meters:** W. B. THORPE [Electrolytic meter] 865/08.

**Storage Batteries:** P. SCHREIBER [Concentric cylindrical electrodes] 105/08.

**Switchgear, Fuses, and Fittings:** B.T.-H.Co. and J. E. WOODBRIDGE [Reverse current circuit-breakers] 14,565/05; B.T.-H.Co. and E. B. WEDMORE [Cut-outs comprising fuse and mechanical circuit-breaker with carbon contacts] 14,566/05; A. P. HINSKY [Waterproof fibrous conduits] 16,251/07; G. C. FRICKER [Automatic motor speed controllers] 15,013/08.

**Telephony and Telegraphy:** F. H. VARLEY [Mercury interrupters for Ruhmkorff coils for wireless] 16,461/07.

**Traction:** W. POWLES and E. E. MOORE [Cabin instruments for railway signalling] 15,677/03.

**Miscellaneous:** J. LECOQUE [Magnetic worm gearing] 15,780/06 and 19,552/08; [Magnetic spur gearing] 23,796/08.

## PATENTS.

*Small Prepaid Advertisements with regard to Patents, &c., are inserted on this page, facing our Patent Record, at 1d. per word (minimum 5s.); three insertions for the price of two. Rates for displayed and card advertisements on application.*

*Advertisement matter, accompanied by a remittance, should be addressed to the Kilowatt Publishing Co., Ltd., 203 Temple Chambers, London, E.C.*

**RIGHTS OF PATENT** No. 27,090/12 offered for Sale. Patent refers to **REVERSE CURRENT CIRCUIT-BREAKER** for alternating current, avoiding potential coil, thus ensuring selective action. Particularly important application for absolute **SELECTIVE SECTIONALISING OF FAULTY CABLES** without need of pilot wires between terminals. Further explanation given upon inquiry.—**P. ACKERMAN**, 185 Carlton Street, Toronto, Ontario, Canada.

The Proprietor of the Patents Nos. 24,702 of 1908 and 24,708 of 1908 for "Improvements in and relating to **ELECTRIC FUSIBLE CUT OUTS**" and "Improvements in **SEAL FASTENINGS**," is desirous of entering into arrangements by way of license and otherwise on reasonable terms, for the purpose of exploiting the same and ensuring their full development and practical working in this country. All communications should be addressed in the first instance to:—**Haseltine, Lake & Co.**, Chartered Patent Agents and Consulting Engineers, 28, Southampton Buildings, Chancery Lane, London, W.C.

**CONTINUOUS CURRENT DYNAMO MACHINES.**—The Proprietors of Patent No. 25,167/10 are desirous of working the above invention in Great Britain, and therefore invite communications with a view to the sale of the Patent or the granting of Licences to work the invention on reasonable terms. An illustrated description of the invention may be obtained from **BREWER & SON**, Patent Agents, 33 Chancery Lane, London, W.C.

**REMOVAL.**

**MR. J. G. LORRAIN, M.I.E.E., M.I.Mech.E.,** Chartered Patent Agent, has removed his office from Norfolk House, Norfolk Street, Strand, W.C., to **Staple Inn Buildings, High Holborn, London, W.C.**

**John E. Raworth,**

*Queen Anne's Chambers, Chartered Patent Agent.  
36, Broadway, Westminster, London, S.W.*

## AGENCIES.

**AGENTS** to sell the latest and most unique electric appliance on the market. Write for particulars. Box 2949, **ELECTRICAL ENGINEERING**, Temple Chambers, London, E.C.

**FOR SALE AND WANTED.**

**AN OPPORTUNITY.**—We are closing our Arc Lamp Carbon Department, and we are offering large quantities of **WOTAN FLAME CARBONS**, 50 per cent. and 5 per cent. for cash off the List. **DAVIS ELECTRICAL Co.**, 17 Moor Street, London, W.

**CABLE CASINGS** to compete against any Manufacturers in the World, trade discount on application. Creosoted troughing and timber for underground work, also woodwork of all descriptions. Send 1s. 6d. (export 3d. extra) for the most up-to-date illustrated list (264 pages) of woodwork and timber in the World, to include 4-fold, brass-jointed boxwood rule. Will return money in exchange if not worth 2s. 6d. to you. **JENNINGS & Co.**, 955 Pennywell Road, Bristol.

**ELECTRICAL ENGINEERING BOOKS AT HALF PRICES!!** Books on Electrical, Engineering, Technical, and all other subjects supplied. Sent on approval. State wants. Catalogues Post Free. Books bought. **W. & G. FOYLE**, 121-123, Charing Cross Road, London, W.C.

**GAS RETORT CARBON** for sale. Pitch, Insulating Material, Carbon Electrodes. We supply the trade. **V. DASNIERES**, 21 Water Lane, E.C.

**PLATINUM UTENSILS, SCRAP, LAMP TOPS.**—Best prices given by **DERBY AND Co., LTD.**, 44 Clerkenwell Road, London, E.C. **N.B.**—Platinum Sold.

*For Official Advertisements see p. vi.*

**Important Notice to the Trade and Public**

THE  
**BRITISH THOMSON-HOUSTON CO., LTD.**

hereby give notice that an action has been commenced against

**THE PRESTON ENGINEERING COMPANY LIMITED**

**FOR AN INJUNCTION TO RESTRAIN THE SALE OF TUNGSTEN DRAWN WIRE LAMPS** manufactured in infringement of Letters Patent Nos. 21,513\* of 1906 and 17,722 of 1911 and **FOR DAMAGES.**

The Trade and Public are warned that like proceedings will be taken against any users of or dealers in infringing lamps.

**THE BRITISH THOMSON-HOUSTON CO., LTD.**

Works: Rugby. Registered Offices: 83, Cannon Street, London, E.C.  
Main Lamps and Wiring Supplies Dept.: Mazda House, 77, Upper Thames Street, London, E.C.  
Branches: Sheffield, Manchester, Birmingham, Leeds, Middlesbrough, Newcastle-on-Tyne, Glasgow, Swansea, Cardiff, and Dublin.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A 4-core Pupin loaded submarine cable adapted also for phantom working, will shortly be laid between Nevin in Carnarvonshire and Howth, about eight miles from Dublin. This cable is primarily intended for the Manchester-Dublin service. It was manufactured by Siemens Bros. & Co., Ltd., of Woolwich. The total length is 64 nauts (nearly 74 miles), and it was made in two lengths of 32 nauts. A fifth core, fifty mils. in diameter, is laid up in the cable for a distance of half a naut at each end of the completed cable for experimental earthing purposes. This core is insulated to 174 mils. in diameter, and is brought out and bound and soldered to the sheath. Each core is made up of strands of equal diameter, with a left-handed lay, giving an overall diameter of 170 mils. and weighing 160 lbs. per naut. The resistance was specified to be not higher than 7452 ohms at 75° F. The dielectric consists of three alternate layers of Chattertons' compound and a spécial gutta-percha having a low leakage and weighing 150 lbs. per naut. Thus the total weight of each core is 310 lbs. and the diameter 0.285 in. The inductive capacity of each core is specified not to exceed 0.33 m.f.d. per naut. The loading coils in each of the four cores are spaced one naut apart. They consist of four similar long and narrow double-wound coils, and when tested with a current of approximately one milliamper, give in the transformer circuit an inductance of about 100 millihenrys, and in the phantom circuit 50 millihenrys. The effective resistances with 800 and 2,000 cycles per second are 7.2 and 15.2 ohms in the transformer circuit, and 3.3 and 7.0 ohms in the phantom circuit. A short distance from the ends of the cable, where the coils are to be inserted, the cores are made solid in gutta-percha, and over this are slipped gutta-percha cones, while the joints are autogenously welded. The armouring is done in the same closing machine, a secondary sheathing being placed over the first, so that they combine to form a single sheathing over the loading coils. The coils themselves are surrounded by a light metallic foil sheathing to prevent moisture being gradually absorbed by the insulation. The specification states that if  $D$  be the distance between any two coils in nauts,  $K$  the wire-to-wire capacity in m.f.d.'s per naut, and  $L$  the inductance per coil in millihenrys, then the product  $DKL$  shall not exceed 21. It was also specified that none of the circuits should have a standard cable equivalent of more than nine miles, excluding losses, which may be eliminated by adding lengths of standard cable to each end of the loaded loop. [The standard cable is one having a loop resistance of 88 ohms per mile, a wire-to-wire capacity for each pair of wires of 0.054 m.f.d.'s per mile, and an insulation resistance of not less than 200 megohms per mile, wire to wire.] It was also specified that the insulation should be not less than 400 and not greater than 2,000 megohms per naut, and actually the tests showed an insulation resistance at 75° F. of between 400 and 600 megohms. During stranding the cores were wormed with wet, fully tanned jute yarn, and the whole was then covered with cotton tape prepared with ozokerit compound, and then with brass tape 0.004 in. thick and 1 in. wide. Another layer of cotton tape was applied over this, and then more jute yarn to receive the sheathing. This consists of fourteen wires of 0.28 in. diameter each, plus one strand of three wires 0.13 in. diameter each of galvanised Ball furnace puddled iron. (This wire has a tensile strength between 23 and 30 tons per sq. in., can be twisted six times in six inches, and gives over ten per cent. elongation in ten inches.) Before being applied, the wires were heated and run through pure hot gas-tar. The length of lay is eighteen inches and is left-handed. Over this there are two coatings of compound and two servings of three-ply tarred jute yarn, laid in opposite directions. The overall diameter of the cable is 2.05 in., and the weight about 12.5 tons per naut. When tested with a current having a frequency of 800 cycles per second, the attenuation constant was found to be 0.01504, and 0.1524 for the transformer circuits, and 0.01510 for the phantom circuit.

Since the introduction of the Horophone in June last, it appears that the Post Office has been putting difficulties in the way of watch and clock makers who desire to use it. In addition to the fee of one guinea now charged by the Post Office to licensees for office expenses, the department is considering charging an annual royalty. Licensees are not being issued until a decision is arrived at, but in the meantime applicants

are being authorised to proceed with the installation of their apparatus, after making a deposit of three guineas, and agreeing to conform to the conditions of the licence when it is issued, or alternatively to dismantle their apparatus if they cannot accept its conditions, when the deposit will be refunded. Mr. F. Hope-Jones (managing director of the Synchronome Co., Ltd.) has written to the Post Office, pointing out that the watch and clock makers of other countries are freely permitted to listen to the international time signals (in the transmission of which the British Empire takes no part), and any attempt to restrict their reception in this country would be detrimental to the science of accurate time measurement, and would put the British watch and clock makers at a disadvantage to their foreign competitors. Mr. Hope-Jones also points out that the international wireless time signals interfere in no way with the Post Office System of telegraphic time signals for the synchronisation of clocks. The Wireless Telegraphy Act of 1904 did not contemplate any such service, and so the Post Office is taking a free hand in the matter. The correctness of the attitude taken up is being contested by Mr. Hope-Jones on behalf of the clock- and watch-making profession.

The Compagnie Française des Câbles Télégraphiques now have three of their West Indian cables down, viz., Mole St. Nicolas-Port au Prince, Puerto Plata-Martinique, and Cayenne-Salinas. The Chio-Tenedos cable was repaired on the 28th ult., and on the 29th ult. the Tenedos-Lemnos cable was put into working order again. The Pernambuco-Para cable was restored on the same day, and on the 1st inst. the Chio-Smyrna cable was repaired. The Pernambuco-Ceara cable was working as usual on Saturday last.

### ELECTRIC TRACTION NOTES

Constructional work on the electrification of the London & South-Western Railway Co.'s suburban lines (ELECTRICAL ENGINEERING, December 12th, 1912, p. 696, June 12th, 1913, p. 345, and August 21st, 1913, p. 480), has recently been started. The generating station is to be at Wimbledon adjacent to the main line. Six 5,000 kw. 11,000-volt 3-phase turbo-alternators will be installed. They will run at 1,500 r.p.m. The steam pressure will be 200 lbs. per sq. in., with 200° F. superheat. There will also be two auxiliary steam turbines driving, through gearing, 400-kw. dynamos for the auxiliary services. The switch-house will contain three floors, and the main oil switches will be electrically controlled from a desk on the first floor, overlooking the engine-room. The feeder cables will be paper-insulated, lead-sheathed, and armoured. They will in most cases be supported on posts beside the line, and will be so arranged as to afford a duplicate supply to every sub-station. Two sizes of converters will be used, the larger having a continuous capacity of 1,875 kilowatts, at Waterloo (4), Clapham Junction (3), Raynes Park (2), Barnes (2), and Twickenham (3), and the smaller, having a continuous capacity of 1,250 kilowatts, at Hampton Court Junction (2), Kingston (2), Sunbury (2), and Isleworth (2). The conductor rail will be laid 16 in. from gauge, and with its contact surface 3 in. above rail level. The resistance of this rail is  $6\frac{1}{2}$  times that of copper, and its weight is 100 lbs. per yard. For the first section of the electrified lines, 84 train units are being provided. Each unit will consist of three compartment type coaches, two motor cars with two motors on one truck, and a trailer. Seating accommodation for 190 passengers is to be provided. Multiple-unit control to give uniform acceleration has been adopted. New running sheds and repair shops will probably be built at Wimbledon, Hampton Court, Fulwell, and Hounslow. It is the intention to commence electric working on the Kingston Roundabout line first, and it is hoped that this line will be in operation before the end of next year. Electric services on the Hampton Court and Shepperton branches and on the Hounslow Loop line will be added as soon afterwards as possible.

International Railphones, Ltd., are installing an equipment of their type "M" system of inductive signalling to moving trains on the Midland Railway. The system was described in ELECTRICAL ENGINEERING, July 11th, 1912, p. 395.

The Highways Committee of the L.C.C. propose to apply for powers next session for the construction of about six miles of tramways at an estimated cost of £225,880. The bulk of it is on the conduit system, but a small portion of a line from Lee Green to Eltham will be a combination of conduit and overhead. Another scheme will be an extension of the line now terminating at Farringdon Street Station to Ludgate Circus.

## LOCAL NOTES

**Bognor: Electric Supply.**—The local company's electricity undertaking was opened last week.

**Dewsbury: Rateable Value System of Charging.**—The Council has adopted the rateable value system of charging for private households on the basis of 15 per cent. and 3d. per unit.

**Halifax: Electric Tariffs.**—As the result of a dispute between the Electricity and Gas Committees regarding tariffs, and the desire on the part of several members of the Council that there should be no competition as regards price between the two departments, what has been termed an arbitration is being held between the two committees with a view to settling upon a definite policy.

**Heywood: Bulk Supply.**—The scheme of the Bury Corporation to supply electricity in bulk in this district, which has been referred to on various occasions in these columns, was the subject of a Board of Trade inquiry last week. The proposal was opposed by the Lancashire Electric Power Co., and one of the reasons for opposing was the allegation that the price proposed to be charged to the Heywood Council is less than that now being charged in Bury. This line of argument was not disputed, counsel for the Bury Corporation stating that even if the Corporation chose to make a loss, it was no business, at any rate, of the Power Company. The Board's decision will be made known at a later date.

**Galashiels: Electric Supply.**—After considering for some time the possibilities of a municipal supply scheme, the Council decided to leave the matter in the hands of private promoters, and Mr. George Balfour has been able to promote the Galashiels & District Electric Supply Co., with a capital of £30,000. The new company will apply for a Provisional Order next session, and a suitable site for a power station has already been secured. The plans for the scheme include 1,400 kilowatts of plant, with building accommodation for 4,000 kw.

**London: Shoreditch: Bulk Supply.**—The proposal, by the County of London Electric Supply Co., to supply the Council with electricity in bulk, has been put upon one side. In reporting to this effect, the Electricity Committee give the following reasons:—(a) That the company stipulates for a higher load factor than the actual load factor found in practice in the Shoreditch system. (b) That the pressure of the proposed supply, i.e., 10,000 volts, would involve extensive transformation plant. (c) The undertaking given by the company as to spare plant and mains is not satisfactory. For these reasons the Committee have come to the conclusion that the proposed bulk supply would be more expensive than that generated at the Council's own works.

**Gillingham: Diesel Engines.**—The Continental makers of the new Diesel engine on order by the Council, have offered to fit it so that it will run on gas tar oil, for an additional cost of £100: but before deciding upon having this done, the Electrical Engineer and Chairman of the Electricity Committee are to inspect the Kingston engines which are fitted for running in this manner.

**Llanelly: Electric Cooking.**—A series of electric cooking demonstrations and lectures have been carried out at Cwmbach Buildings under the auspices of the Llanelly & District Electric Light & Traction Co., Ltd., by arrangement with Messrs. Gillespie & Beales, the sole wholesale agents for the "Tricity" electric cooker. These lectures were given by Mr. F. S. Grogan, of the British Electric Transformer Co., Ltd., the makers of "Tricity" cookers, and his lectures opened on Tuesday afternoon, when there was a good audience of many of the leading ladies in the town. The lectures were given to very attentive audiences during the week, and Mr. Grogan created general interest in bringing forward the claims of electric cooking to be the best, cleanest, and most perfect method, and in demonstrating the excellent results which can be so easily obtained with the minimum of trouble by anyone handling the "Tricity" cooker.

**Macclesfield: Electric Supply.**—The new electricity company of Macclesfield hopes to be in a position to supply electrical energy in February. The first generating unit is a 500-h.p. Diesel set. The directors of the new company are Mr. H. Hirst (Chairman), Mr. M. Railing, Mr. E. G. Byng, and Mr. A. Baron (Managing Director and Engineer-in-Chief). For many years Macclesfield has been on the point of obtaining a supply of electrical energy, but time and again, from various causes, municipal and company schemes have failed to be completed.

**Manchester: Strike of Electrical Wiremen.**—It is stated that some twenty firms have acceded to the men's demands for an extra 1d. per hour, and work has been resumed in each case. According to the *Manchester Evening News* of Monday, about 150 workmen were then out on strike.

**Wimbledon: Cooking Demonstrations.**—A series of demonstrations on electric cooking with "Tricity" cookers is being given this week at 58 Hill Road, Wimbledon, by Mr. F. S. Grogan, of the British Electric Transformer Co. To-day's demonstrations will be at 11.30 a.m. and 7.30 p.m., and Friday's at 3.30 and 7.30 p.m.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Darlington.**—An application for a loan of £21,190 was incurred into last week for the electricity undertaking.

**Finchley.**—Loans amounting to £13,500 are to be applied for in connection with mains and services.

**Gillingham.**—A loan of £5,000 for a three years' expenditure on mains and services is to be applied for.

**Grange-over-Sands.**—Mr. R. Burnett, Chief Electrical Engineer to the Barrow Town Council, has been retained as consulting engineer to advise the Council concerning an agreement for electric supply with a private company.

**Harrogate.**—A L.G.B. inquiry has been held concerning a loan of £9,439 for electrical extensions.

**Hayland.**—Mr. A. Barker has submitted a report upon an electric lighting scheme.

**Hornsey.**—New sub-station at Muswell Hill.

**Lurgan.**—Details of a £12,000 electric lighting scheme are now being considered by the Council. Mr. T. W. Bloxam, City Electrical Engineer at Belfast, has reported favourably upon it.

**Maidstone.**—A loan of £4,000 for mains and services extensions is to be applied for.

**Manchester.**—Water-tube boilers, superheaters, economisers, coal chutes, ash conveyor, pipe connections, pneumatic ash handling plant, &c. Chief Electrical Engineer, Dickinson Street. (See advertisement on another page.)

**South Shields.**—A L.G.B. inquiry was held last week concerning a loan of £33,305 for electrical extensions. It is proposed to instal a 2,000-kw. turbine driving tandem generators, together with a new water-tube boiler, economiser, &c.

**Teignmouth.**—Mr. E. M. Lacey has presented a report with regard to an electric lighting scheme for this district. The scheme includes two oil-driven generators and a battery, and the total capital expenditure is put at £20,800.

**Wigan.**—A loan of £8,000 for new turbine and accessories is to be taken up.

**Withernsea.**—A company is to be formed to establish an electric lighting installation.

## Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Aberdeen.**—Cinematograph theatre, Union Street.

**Barking.**—New secondary school, Longbridge Road.

**Barrow-in-Furness.**—Public baths.

**Belfast.**—Sixty-three blocks of houses. City Surveyor.

**Bradford.**—Electrical installation at Technical College. Director of Education, Town Hall.

**Dundalk.**—Electrical fittings, &c., for the mortuary chapel, St. Patrick's Cemetery. Nov. 11th. Secretary, General Burial Board.

**Ealing.**—New magistrates' court (£7,725).

**London: Hammersmith.**—Cinematograph theatre in King Street.

**Hampstead.**—Golder's Green Hippodrome, close to Tube railway station.

**Stepney.**—New municipal offices.

FOR  
STEAM JOINTS  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

**L.C.C.**—140 lighting points at Hammersmith Trade School for girls. (See advertisement on another page.)

**Leigh.**—Cinematograph theatre. Architect, Arthur Peel, Leigh.—New secondary school, Windermere Road.

**Manchester.**—Municipal school, Nansen Street, Ardwick. Town Clerk.

**Nelson.**—Rebuilding after fire of Albert Hall and shops, Tickle Street.

**Shipley.**—New public offices (£10,500).

**Stretford.**—Elementary school in Trafford Park. Education Offices, Old Trafford.

#### Miscellaneous

**Bournemouth.**—The Tramways Committee requires ten bogey electric trams. General Manager.

**Dublin.**—The Dublin United Tramways Co. invites tenders for a twelve months' supply of stores, including electrical fittings. Chairman. (See advertisement on another page.)

**Grimsby.**—A supply of metal filament lamps, continuous-current meters, house service fittings is required. Borough Electrical Engineer. Nov. 13th.

**London: St. Pancras.**—The question of superseding the old type of arc lamps in Hampstead Road by up-to-date flame arc lamps is under consideration.

**Hammersmith.**—Arc lamps for fixing on consumers' premises. (See advertisement on another page.)

**West Riding.**—The Yorkshire (West Riding) Tramways Co. requires a twelve months' supply of electrical lamps and fittings. Nov. 21st. General Manager.

### TENDERS RECEIVED AND ACCEPTED

**Huddersfield.**—The tender of Switchgear & Cowans at £2,259 for H.T. switchboard is recommended for acceptance by the Electricity Committee.

### APPOINTMENTS AND PERSONAL NOTES

Mr. A. J. Hodgson has been presented with a silver salver weighing 80 ounces by the directors, staff, and employees of Messrs. Crompton & Co. on his relinquishing the joint management under the scheme of reorganisation.

Sir Joseph Swan, F.R.S., celebrated his eighty-fifth birthday on Oct. 31st.

In consequence of the appointment of Mr. L. Johnston, General Manager and Engineer of the Gloucester Corporation tramways undertaking, to the General Managership of the Southampton Corporation tramways, Mr. F. H. Corson, at present Borough Electrical Engineer, has also been appointed Tramways Manager.

Mr. S. H. Fowler, of Dewsbury, has been appointed Mains Superintendent for the southern district of the Stoke-on-Trent electricity undertaking at a salary of £130, in succession to Mr. E. D. Redfern.

**Electric Light Switching.**—The awards in the recent switching examinations held by A. P. Lundberg & Sons have now been made, and certificates and prizes are about to be dispatched to the successful competitors, who number over one hundred, and whose names appear on an advertisement page. The certificates measure about 17 in. by 13 in., and are very neatly designed. The margin is attractively decorated with diagrammatic representations of the many diversified types of tumbler switches for the convenient control of complicated circuits, which have been so successfully developed by the firm.

**THE "NEW BASTIAN."**

Ask for Prices and Particulars from

THE BASTIAN METER CO., LTD., Kentish Town, N.W.

### MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. George Smith & Sons, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £76 to £76 10s. (last week £78 to £78 10s.).

**Change of Address.**—The Tudor Accumulator Co., Ltd., inform us that, on and after Monday next, the address of their head office will be: 3 Central Buildings, Matthew Parker Street, Westminster, S.W. Their telephone number will remain 2600 Victoria.

**New Telephone Number.**—The Edison & Swan United Electric Light Co., Ltd., Ponders End, Middlesex, have increased their telephone service to six lines, and their new number is Enfield 520.

**Companies to be Struck off Register.**—Unless cause is shown to the contrary, the under-mentioned companies will be struck off the Register of Joint Stock Companies in three months' time:—Electric Power Plants, Ltd.; Solenoids, Ltd.; and Titan Electric Co., Ltd.

**Osram Lamp Patents.**—The action by the Osram Lamp Works, Ltd., against the Yorkshire Incandescent Electric Lamp Co., was concluded on Friday last, when the Yorkshire Co. submitted to an injunction restraining them from infringing the Osram patents for squirted filaments *in perpetuo*. It was stated before Mr. Justice Astbury on Friday that the infringing filaments were obtained by the Yorkshire Co. from Germany, with the assurance of the German manufacturers that there was no infringement of patents. When the Osram Co. brought the action the Yorkshire Co. endeavoured to get the manufacturers of the filaments to demonstrate the process employed in the manufacture. This they refused to do, and the Yorkshire Co. had now entirely abandoned the manufacture of lamps with squirted filaments.

### NEWPORT CORPORATION.

Electricity Department.

#### ARC LAMP REPAIRER.

THE ELECTRICITY COMMITTEE require immediately an ARC LAMP REPAIRER. Must be thoroughly experienced, preferably in Oliver and Exello lamps. Full particulars, enclosing references and stating wages required, to be addressed at once to the undersigned,

A. NICHOLS MOORE,  
Borough Electrical Engineer.

Town Hall,  
Newport, Mon.  
November 5th, 1913.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

## SUMMARY

THE "Engineers' Club" was opened in Manchester last week, and has already a membership of 560. (Page 626.)

We give notes on two pending law suits relating to metal filament lamp patents. In one case the Osram Lamp Works is alleging infringement by Pope's Electric Lamp Co. of its patents relating to squirted filaments, and in the other the B.T.-H. Co. claims that the Preston Engineering Co. has infringed two patents relating to the drawing of tungsten wire. Another important development is the opposition by Siemens Bros. & Co. to the grant of a patent for drawing tungsten wire to the Westinghouse Metallfaden Glühlampenfabrik. (Page 627.)

SIR WILLIAM PREECE, formerly Engineer-in-Chief to the Post Office, died on Wednesday of last week.—Sir Robert Hunter, late solicitor to the Post Office, also passed away last week. (Page 628.)

An electric car equipped with the Edison battery is on view in the Olympia Motor-Car Show, where a number of new electrical engine-starting devices are shown and many forms of car-lighting equipment. (Page 629.)

INFORMATION respecting petrol electric traction is asked for in our Questions and Answers column. (Page 630.)

THE annual report of the Postmaster-General reviews some of the technical developments of the telephone,

telegraph, and wireless services during the past year. Under Telephony and Telegraphy, notes are also given on a new alternating current compensation apparatus for telephone measurements, and the first of a series of lectures on wireless telegraphy by Mr. J. St. V. Pletts. A committee has been appointed to consider State-aided research in telephone and telegraph matters. (Page 632.)

MR. J. W. JACKSON discussed, in a Paper before the Newcastle Section of the Institution of Electrical Engineers, the design of boilers, superheaters, and other details. (Page 631.)

An interesting Paper on electric locomotives, by Mr. F. Lydall, is abstracted in our Electric Traction Notes, and some particulars are given of the difficulties experienced in practice with some forms of side rod drive. A new pattern of pantagraph collector is also described. (Page 633.)

THE sum of £1,500 is to be spent at Rathmines on wiring premises.—The high cost of street lighting at York, mostly gas, is unfavourably compared with electric lighting elsewhere.—Electric heating has been adopted for the pavilion at Llandudno.—A surplus of £521 is shown by the Ilford electricity accounts for last year, and £1,902 at Southport. The proposal of the Manchester Corporation to purchase the Trafford Power & Light Supply Co. is to be opposed by the Stretford Council.—We give the terms of the settlement of the wiremen's dispute in Manchester. (Page 635.)

At the annual meeting of the Edison & Swan United Electric Light Co. on Tuesday, the Company's financial position was explained as being mainly due to the large loss on the rearrangement of the lamp factory in consequence of the new plant necessary to deal with drawn wire filament lamps. (Page 635.)

A PATENT by F. J. Sprague, F. T. Bowles, and G. H. Hill, dealing with the electrical working of water-tight doors, &c., expires during the current week after a full life.—The specifications published by the Patent Office last week include one by the B.T.-H. Co. dealing with the compensation of A.-C. commutator motors, and one by S. G. Brown covering some improvements in his relay for wireless. Notes on several opposition cases, &c., are given. (Page 636.)

THE following plant is required: Southampton, steam turbo-alternator; Wolverhampton, rotary-converter set; Aldershot, cable; generating plant at Dawlish, Rangoon, Ikley, Montevideo, Holmfirth, Elland, and Prince Albert (S.A.). Electric lighting schemes are in contemplation for Ballater, Lurgan, Braintree, and Lytham.—The Postmaster-General proposes to erect a power station in Wiltshire. (Page 637.)

An electric kitchen equipped with apparatus aggre-

gating over 50 kw. is at work at a Brighton hotel. (Page 639.)

A LINE of pipe ventilated motors is described. (Page 639.)

AMONG novelties described in illustrated articles are a field switch, some heating apparatus with alternative contacts for different voltages, a semi-indirect lighting fitting which can be lowered for cleaning, and a new enclosed circuit-breaker. (Page 640.)

RECENT examples of shop-window lighting and electric signs are illustrated, and an installation of over 200 electric clocks at the London Hospital is described. (Page 641.)

SOME further notes are given on the Glasgow Electrical Exhibition, the merits of a particular brand of glassware are discussed, and a screw cap lamp with specially small bulb is illustrated. (Page 642.)

### ARRANGEMENTS FOR THE WEEK

TO-DAY (THURSDAY), NOVEMBER 13TH.

*Institution of Electrical Engineers.*

8 p.m. At Victoria Embankment. Address on "Pressure Rises" (experimentally illustrated), by the President.

FRIDAY, NOVEMBER 14TH.

*Physical Society.*

8 p.m. At Imperial College, London. The agenda includes "On Polarisation and Energy Losses in Dielectrics," by A. W. Ashton.

*Institution of Electrical Engineers.*

8 p.m. At Royal College of Science. Chairman's Address by G. M. Harriss.

MONDAY, NOVEMBER 17TH.

*Electro Harmonic Society.*

8 p.m. Concert (Ladies' Night) at Holborn Restaurant.

TUESDAY, NOVEMBER 18TH.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At the University. "A Two-rate Tariff System without Time-operated Control," by H. H. Perry.

*Illuminating Engineering Society.*

8 p.m. At Royal Society of Arts. Report on Progress during the Vacation.

### The London Electrical Engineers.

(TO-DAY) THURSDAY, NOVEMBER 13TH.—*C. Company.* Technical Instruction, 7 to 10 p.m.

FRIDAY, NOVEMBER 14TH.—*D. Company.* Technical Instruction, 7 to 10 p.m.

SATURDAY, NOVEMBER 15TH.—*Headquarters* open from 10 a.m. till noon.

MONDAY, NOVEMBER 17TH.—*A. Company.* Technical Instruction, 7 to 10 p.m.

TUESDAY, NOVEMBER 18TH.—*B. Company.* Technical Instruction, 7 to 10 p.m.

WEDNESDAY, NOVEMBER 19TH.—*Recruits only.* Infantry Drill and Technical Instruction, 7 to 10 p.m.

THURSDAY, NOVEMBER 20TH.—*C. Company.* Technical Instruction, 7 to 10 p.m.

FRIDAY, NOVEMBER 21ST.—*D. Company.* Technical Instruction, 7.30 to 10 p.m.

SATURDAY, NOVEMBER 22ND.—*Headquarters* open from 10 a.m. till noon.

### THE ENGINEERS' CLUB, MANCHESTER

AN event in engineering circles in Manchester last week was the opening of the Engineers' Club in Bridgewater Buildings, Albert Square. The club is a social, non-political club for engineers, and that it will fill a "long-felt want" is shown by the fact that no less than 560 members (including some of the most distinguished engineers in the Manchester district) have already joined. A large proportion of these are connected with the electrical industry. The qualification for membership is occupation in the design, superintendence, or direction (technical or commercial) of engineering work in its various branches, and in addition a limited number of members will be admitted who, while not actually possessing these qualifications, are connected more or less intimately with engineering. There is a large and comfortable reading and smoking-room, a large dining-room, two smaller dining-rooms for private functions, a card-room, a billiard-room with two tables, and a lift between the various floors.

The directors entertained the committee of the club and members of the engineering and Manchester Press at luncheon on Thursday, when the chairman, Mr. Daniel Adamson, presided, and the guests included the Deputy Lord Mayor of Manchester and the President of the Manchester Chamber of Commerce. After the luncheon an inspection of the rooms was made, and the excellence and completeness of the arrangements reflect great credit upon the honorary secretary, Mr. E. L. Hill, who is ably assisted by Mr. A. L. Green, the secretary. It is also largely due to Mr. Hill's unflagging energy and zeal that the club has been opened with so large and representative a membership that its success is assured from the outset, and the engineers of Manchester owe him a debt of gratitude.

The inaugural members' dinner was held on Friday evening.

### THE EFFECT OF METAL FILAMENT LAMPS ON THE EYES

SOME time ago (ELECTRICAL ENGINEERING, March 11th, 1909, p. 225) we referred to the alleged damage liable to be done to the eyesight by metal filament lamps owing to ultra-violet rays present in the light emitted by them. Researches were quoted (see also ELECTRICAL ENGINEERING, August 27th, 1908, page 312) showing that the proportion of these rays reaching the eye was infinitesimal, less even than in sunlight, and that the harmful effects that have been experienced were due to the unsuitable use of light sources of high intrinsic brilliancy without proper diffusion of the light, or, in other words, to "glare." Such ultra-violet rays as there may be are nearly all arrested by the glass of the bulb, and their short wave-length renders it difficult for them to penetrate far into the surrounding atmosphere. Indeed, the latter fact introduces considerable difficulties where ultra-violet rays are being produced on purpose. The danger of glare is now fully realised by illuminating engineers, and much ingenuity has been successfully applied to its mitigation. We are prompted to refer again to this subject by the words of a "Birmingham oculist" interviewed by a representative of the *Birmingham Daily Mail* and reproduced in a recent issue of that journal. This gentleman expresses the opinion that "incandescent gas was less hurtful to the eyes than the electric light, on account of the ultra-violet rays of the latter." This implies that gas mantles emit no ultra-violet rays and electric lamps a harmful quantity, whereas the truth is that the glowing gas mantle emits, if anything, more owing to its probable higher temperature, but in neither case is the quantity sufficient to be harmful. The subject is viewed from a different standpoint by M. Luckiesh in an article in the *Electrical World* (New York). This author deals with the theory that fatigue of the eye is purely a matter of energy absorbed and converted into heat, and analysing the absorption of the different rays in the various media of the eye, he shows that the higher the temperature of the radiating body, and consequently the larger the proportion of high frequency rays present, the more is the energy absorbed before it reaches the retina. This would actually imply that the retina is better protected from ultra-violet than from infra-red rays, so that it may be that excess of infra-red rays is, after all, more harmful than excess of ultra-violet, in that for the same visual effect a larger amount of energy reaches the retina to be absorbed by it.

**The British Standard Meter Specification.**—In a Paper read last night before the Birmingham Local Section of the Institution of Electrical Engineers, Mr. S. H. Holden referred to the British Standard Specification (No. 37) for consumers' electric supply meters published in 1907, and while recognising the advantages of such a specification, urged that there were several points as to which it now required amendment. He wishes to extend the number of standard sizes in both directions, and to insist on cases of cast-iron or pressed steel. Modifications are also recommended in the clauses dealing with terminal boxes, labels, cyclometer dials and testing dials, and he asks that the allowable loss of pressure in the main circuit at full load be lowered from 2 volts to values ranging from 0.75 to 0.075 volt, according to the size of the meter, and the allowable watts lost in the pressure coil be altered from "4 watts for each hundred volts" to 2 watts for single-phase meters and 7 watts for continuous-current meters under 650 volts. Starting currents he would specify at  $\frac{1}{2}$  per cent. of full load with a minimum of 0.05 amperes in the case of continuous-current ampere-hour meters. Accuracy, he thinks, should be within 2 per cent. from 1/20 to full load, with a lower limit of not less than half an ampere in the case of continuous-current ampere-hour meters. A little more definiteness of phraseology is asked for in the clauses relating to the effect of variations in supply voltage, and the inclusion of provisions relating to variation in wave form. In conclusion, he calls upon the Institution to urge the Engineering Standards Committee to publish as soon as possible a revised specification, and that with a view to its wider use and circulation the price should be reduced to one shilling per copy in order that manufacturers may be able to include copies with their tenders. He also considers it desirable that some distinguishing mark be placed upon meters which are sold as complying with the British Standard Specification.

## METAL FILAMENT LAMP PATENTS

HERE are two important patent lawsuits pending in connection with metal filament lamps, and although these will probably not come on for hearing until next year, yet some particulars as to the matters in dispute may be of interest to our readers. The British Thomson-Houston Co., Ltd., are bringing an action against the Preston Engineering Co., Ltd., alleging infringement of Patents Nos. 21,513\*/06 and 17,722/11.

Patent No. 21,513/06 was taken out by the B.T.H. Co., to whom it was communicated by the General Electric Co. of America. During September of last year the B.T.H. Co. sought leave to amend the original specification. There was some opposition to the proposed amendments (ELECTRICAL ENGINEERING, Dec. 19th, 1912, p. 703), but the Comptroller allowed the claims to be amended so that they now read thus:—(1) The method of working tungsten, which consists in subjecting the metal in a coherent form to the action of heat while it is being hammered, rolled, or drawn. (2) The method of working tungsten which consists in heating the metal by means of an electric current while it is being hammered, rolled, or drawn. (3) In a method of working tungsten as claimed in the preceding claims, protecting the coherent metal against oxidation during the working operation by means of a coating of metal which may be subsequently removed, or by conducting the operation in a vacuum or a reducing, or inert, atmosphere. (4) Incandescent electric lamp filaments of tungsten manufactured by working the coherent metal, substantially as hereinbefore described.

Patent No. 17,722/11 is in the name of J. T. H. Dempster, of Schenectady, U.S.A. It deals with the hot drawing of tungsten wires and the use of a lubricant. A lubricating solution of the consistency of cream is used. Previous to drawing, the wire is heated to a red heat and then passed through the solution, which may be of finely divided graphite held in suspension in water or oil, known as "aqua-dag" and "oil-dag." In the case of "aqua-dag" a 10 per cent. solution of ammonium sulphide may be added. It is found that the lubricant is thus baked on the wire as a shiny black adherent coating. In addition, the wire may again be passed through a lubricating bath just previous to the actual drawing. There are four claims reading thus:—(1) In wire drawing, the method of lubricating the wire, which consists in providing it with an adherent coating of graphite. (2) In wire drawing, the method of lubricating the wire, which consists in applying to the wire an adherent coating of graphite by a baking or burning operation. (3) The method of lubricating wire, which consists in bringing the wire while heated into contact with a carbonaceous lubricant, before it passes to the wire-drawing die. (4) The improved method of lubricating tungsten wire, which consists in baking or burning on the wire a carbonaceous or graphite coating which remains on the wire after it has passed through the die, substantially as hereinbefore described.

The second of the lawsuits is an action by the Osram Lamp Works, Ltd., against Pope's Electric Lamp Co., Ltd., alleging infringement of Patents Nos. 23,899\*/04 and 18,622/06. These were the patents on which the action against the "Z" Electric Lamp Co., Ltd., was brought (ELECTRICAL ENGINEERING, Vol. VIII., 1912, pp. 218, 229, 243, 255, and 274).

The celebrated Patent No. 23,899\*/04, by Dr. A. Just and F. Hanaman, of Vienna, was amended in 1909 (ELECTRICAL ENGINEERING, Sept. 9th, 1909, p. 779, Vol. V.). It describes a process of manufacturing filaments of pure tungsten by mixing finely divided tungsten or tungsten compounds such as tungstite, tungstic acid, or tungstic sulphide with an organic binding medium such as collodion, or a solution of cellulose in chloride of zinc or cupreous ammonia oxide. The filaments squirted from the resulting paste are then carbonised (in some cases after denitration), and the carbon is then removed by passing current through the filament and raising it to a high temperature in an atmosphere of steam and hydrogen. The carbon is oxidised to form carbonic oxide, and a filament of pure tungsten is left. The filaments are then rendered uniform by submitting them to the action of current in an atmosphere of volatile tungsten compounds in the presence of a large quantity of hydrogen, whereby the tungsten deposited equalises the filaments. The two amended claims left are as follows:—(1) Incandescing bodies for incandescent electric lamps, consisting of tungsten manufactured substantially as and in the manner hereinbefore described. (2) Process for the manufacture of incandescing bodies in accordance with Claim 1, characterised by the fact that the tungsten or compounds of this metal are mixed with organic binding media, formed and carbonised, whereupon the carbon is removed chemically substantially as described.

Patent 18,622/06, taken out by P. M. Justice for the Deutsche Gasglühlicht Akt.-Ges., may be summarised as follows:—To remove the carbon from the carbonised filaments produced by the method above described, the carbon, instead of being oxidised, is carried away in the form of a compound, not with oxygen but with nitrogen and hydrogen. The carbonised filament is caused

to incandesce in an atmosphere of ammonia (or a mixture of hydrogen and nitrogen), and the carbon is carried away in the form of cyanogen and hydrocyanic acid. This method, the patent says, is easier to carry out than the steam-hydrogen method, and there is no danger of the tungsten filament being attacked. There is one claim to this patent, which reads:—A method of producing incandescence bodies for electric glow lamps from (common) heat-resisting metals, such as molybdenum, tungsten, vanadium, or tantalum, in which filaments pressed from the powdered metal, with an addition of organic binding materials, are heated in an atmosphere containing both nitrogen and hydrogen but no oxygen, for the purpose of removing the carbon in a gaseous form whilst retaining the metals in the metallic state.

Another interesting matter in connection with metal filament lamp patents is the opposition to the grant of Patent No. 3,162/13 to the Westinghouse Metallfaden Glühlampenfabrik, which has been entered by Siemens Bros. & Co. The case will probably not be decided for some time. Particulars of the patent which is opposed were published in ELECTRICAL ENGINEERING, September 18th, page 532. There are two claims, the first of which reads thus:—In the method of making sheets, rods, wires, filaments, and the like of tungsten or molybdenum or alloys thereof, by the mechanical treatment of ingots of such metals or alloys containing suitable proportions of one or more auxiliary ductile metals, such as nickel, copper or iron, removing such auxiliary metals after the ingots have been mechanically worked to render them sufficiently tough, but in any case before the bodies produced therefrom have assumed their final shapes or dimensions, and then further mechanically working the remaining pure metal by hammering, rolling, or drawing until the bodies of the desired shape or dimensions are obtained, substantially as described. The second claim is for bodies so produced.

In the particulars of opposition, Messrs. Siemens cite four patents as, in their view, anticipating Patent No. 3,162/13. They also say that the invention is not sufficiently or clearly described. The patents cited are No. 3,174/07 by Siemens & Halske, No. 23,335/06 by W. C. Arsem (Schenectady, U.S.A.), No. 19,932/08 by Siemens & Halske, and No. 1,162/11 by Dr. H. G. Moller, of Charlottenburg. The claim in No. 3,174/07 by Siemens & Halske is for subjecting the powdered metal or mixture to be used for the filaments to great pressure, so as to form a solid body, and after that subjecting this body to a strong heat by the passage of a current through it in a vacuum or indifferent atmosphere. There are four claims to Patent No. 23,335/06 by W. C. Arsem (Schenectady, U.S.A.). The first is for a process of manufacture consisting in mixing the metal with a less refractory one, and heating so as to fuse the latter, and then treating the mixture remaining so as to leave a coherent conductor of the refractory metal. The second claim is for alloying a refractory metal with the principal metal having a lower vapourising point, shaping the alloy into wires, and then heating in a vacuum or inert atmosphere to remove the conductor with the lower vapourising point, and leaving the coherent conductor. The third claim is for alloying copper with tungsten. The fourth claim is for the filaments so produced. The claim in Patent No. 19,932/08 by A. G. Bloxam, to whom it was communicated by Siemens & Halske, is for a filament of tungsten or its alloys produced by mechanically working an intimate union of a difficultly fusible metal with an auxiliary metal which is afterwards to be expelled, which process consists in heating tungsten with nickel until a homogeneous solid ductile mass is obtained, then mechanically working the mass, and finally partially or wholly expelling the nickel by passing current through the mass. The claim in Patent No. 1,162/11 by Dr. H. G. Moller, is for the removal of the greater part of an auxiliary metal from the wire before it is arranged on the filament supporting frame, so that with the small residual percentage (not more than 1 per cent.) of the auxiliary metal, the wire, although non-ductile, is sufficiently fusible for mounting on the frame.

**Eggs Fried on Ice.**—To attract attention at a recent exhibition in America a novel advertising scheme successfully adopted by one of the exhibitors, we learn from the *Electrical World* (New York), was to fry eggs in an aluminium dish on a block of ice between two and three inches thick by means of eddy currents induced by an auto-transformer hidden in a box under the ice.

**The Italian Electrotechnical Association.**—The seventeenth annual congress of the Italian Electrotechnical Association, which was postponed owing to the General Elections, will be held in Rome on November 15th and 16th. Prof. Lori will read a Paper on the Norwegian electrolytic nitrogen industry, and Prof. Mengarini will give an experimental lecture on luminescence. Visits to works have also been arranged.

## OBITUARY

WILLIAM HENRY PREECE.

THE death last Thursday of Sir William Preece, K.C.B., F.R.S., at Penrhos, his Carnarvonshire home, removes a venerable and famous pioneer from the field of electrical thought and action. Sir William was seventy-nine years old, and in latter years, as age increased its hold upon him, his appearances at electrical engineering functions became less frequent. The last time that many of our readers saw him was at the meeting of the Institution of Electrical Engineers on May 16th, 1912, when he presided at the presentation of a bust of Lord Kelvin. Another recent appearance was at the opening of the Olympia Electrical Exhibition of 1911. To the end, however, his interest in electrical matters remained keen, and in a quiet way he assisted in charitable and other movements in the interests of the electrical industry. He was President of the Electrical Trades Benevolent Institution.

Sir William Preece had always interested himself in other branches of electrical engineering, and although it was only in 1899 that he retired from the position of Engineer-in-Chief and Electrician to the Post Office, and in 1904 that he finally severed his active connection with the Department, he had had for many years previously a large consulting practice as Consulting Engineer, which he had developed since the earliest days of the industry, and in which he was assisted by his two sons. Some of the first electricity supply works were designed by Sir William Preece. When the late Major Cardew retired from the Board of Trade in 1899, he joined Sir William Preece and Mr. A. H. Preece and Mr. Llewellyn Preece, and the firm of Preece and Cardew (now Preece, Cardew & Snell) was established. Sir William was always popular as a lecturer and an after-dinner speaker, and had an impressive manner and a gift of felicity of expression which stood him in good stead. The work for which he is most famous, of course, was that performed during the fifty years of his service with the Post Office and the telegraph companies. He joined the Electric & International Telegraph Co. in 1853, and was with the L. & S.W. Railway in 1860. In 1870, when the telegraphs were transferred to the State, he was given a post as Divisional Engineer, in 1877 was appointed Electrician (Mr. Edward Graves being then Engineer-in-Chief). Subsequently he was given the title Electrician and Assistant Engineer-in-Chief, and on Mr. Graves' death in 1892 he was appointed Engineer-in-Chief and Electrician. Throughout the whole of this time he was a prolific lecturer and writer of Papers on a great variety of electrical and other scientific matters, as well as those connected with the subject of his profession, and his abilities were recognised by his election as President of the Institution of Civil Engineers in 1898, and of the Institution of Electrical Engineers in 1893 and in 1880, when it was still the Society of Telegraph Engineers. He was made a Fellow of the Royal Society in 1881, and was a frequent speaker before the British Association and other scientific bodies. The "Text-book of Telegraphy," which he wrote in conjunction with Sir J. Sivewright, is a classic, and his "Manual of Telephony," written with Mr. A. J. Stubbs, was for many years the one standard work on this subject, superseding an earlier book on the telephone written in conjunction with M. Julius Maier. Sir William Preece was always proud of having brought over the first telephone to this country in 1877, and it was never known whether it was by his advice or in opposition to it that the instrument was considered by the Department to be only a philosophical toy, and its commercial application left to private enterprise.

To detail all the subjects of his Papers on telegraphy would be to recount the history of its development. He played a prominent part in the establishment of the first London-Paris telephone in 1891. It is well known that he was deeply interested in the possibilities of wireless communication, and has been called by some the father of wireless telegraphy. He experimented himself in conductive and inductive wireless telegraphy between two earthed lines on a considerable scale, and in 1892, after experiments across the Solent and elsewhere, he was able to send messages by this method between Lavernock, near Cardiff, and Flat Holm, across the Bristol Channel, and between Oban and the Isle of Mull. It was largely due to Preece's influence that Mr. Marconi was enthusiastically received here, and that he received encouragement from the Post Office.

Mention has already been made of Preece's connection with the London & South Western Railway; several useful railway signalling instruments are due to his early work.

Throughout his career Preece was the typical engineer of the latter part of the nineteenth century. His great pride was that he "had sat at the feet of Faraday," to use a favourite expression of his own, for he acted as assistant to him for some time at the Laboratory of the Royal Institution. His attention and interest were always more closely devoted to the practical than to the theoretical side of engineering, and during his earlier days as Electrician to the Post Office he was sometimes criticised for not attaching sufficient importance to Oliver Heaviside's mathematical investigations with regard to the propagation of telegraphic and telephonic currents.

Preece was made C.B. in 1894, and K.C.B. in 1899.

It now only remains to add that his earlier training was at King's College, London; but his original home was Wales, and he was of Welsh descent, the son of Mr. R. M. Preece, of Bryn Helen, Carnarvon, where he was born on February 15th, 1834.

Sir William Preece's remains were interred on Tuesday at Llanbeblig Parish Church, near Carnarvon, and a memorial service was held on the same day at St. Margaret's, Westminster. Our readers will be glad to hear his second son, Mr. Llewellyn Preece, who has been seriously ill for some time and was operated upon for appendicitis about a fortnight ago, is now well on the road to complete recovery.

## ROBERT HUNTER.

Another old Post Office servant passed away last week in Sir Robert Hunter, who had only recently relinquished the post of Solicitor to the Post Office, which he had held for over thirty years. His work brought him into contact with many branches of Post Office work, and he came particularly before the eye of the public recently in connection with the transfer of the National Telephone Co.'s undertaking to the Post Office, and the much-discussed Marconi contract.

**School and Library Lighting.**—In view of the attention now being attracted to the question of school lighting, Mr. D. H. Ogley, of the Royal Technical Institute, Salford, has sent us a copy of a Paper dealing with the subject which he presented at a Conference some short time ago. In general, Mr. Ogley reaches the same conclusions as the Committee of the Illuminating Engineering Society, referred to in *ELECTRICAL ENGINEERING*, July 31st, p. 440, although his Paper was published some time before that report made its appearance. He deplores the damage done to the eyesight by unsuitable lighting, and gives the minimum illumination required for reading and writing as 2 foot-candles, while for drawing and distinguishing fine detail he regards from 2 to 5 foot-candles as necessary, according to conditions. He also emphasises that exposed light sources of great intrinsic brilliancy should be avoided by proper shading. With inverted or indirect lighting, he finds the absence of shadows rather wearisome, objects appear to be flat, tiring the eye in the effort to perceive them correctly. A certain amount of direct lighting should be added. The possibility of reflection from blackboards, desks and paper with highly glazed surfaces, should also be avoided, and absence of flickering or variation in the light is important. Dealing with the latter question, however, Mr. Ogley commits an error in stating that metal filament lamps are more affected by variations in voltage than carbon lamps, as their positive temperature-coefficient renders the contrary the case. He also slightly exaggerates the evil of ultra-violet rays, a subject which is dealt with elsewhere in this issue.

**Shock Due to Defective Hand-Lamp.**—An inquest was held on Nov. 5th regarding the death of Thomas Bradley, a locomotive engine-driver, at the oil, grease, and candle works of Mawson, Clark & Co., of High Dunston. While effecting some repairs Bradley received a 250-volt shock from an unearthed hand-lamp. No first-aid men were present and artificial respiration was not resorted to, as it should have been.

**Damages for Defective Repairs.**—In the Shoreditch County Court on Tuesday last, before Judge Cluer, a claim was made by Mrs. E. Benkert against the Harman Allen Manufacturing Co. for £26, the cost of fitting two new field coils by Anderson & Anderson to a 1½-h.p. motor. Judgment was given for £5 15s. 6d. with costs. It appears that the Harman Co. estimated to fit two new impregnated field coils to the motor for £3 19s. 6d. The coils, however, soon burnt out, but the Harman Co. disclaimed liability, as they said the motor was in a damp situation, and the work was not guaranteed. In giving judgment as above, however, Judge Cluer said that although there might not be a specific guarantee, everybody knew that it was understood that the work would last a reasonable time if properly carried out.

## ELECTRICITY AND MOTOR CARS

## Some Notes on the Olympia Show

THE Automobile Exhibition now being held by the Society of Motor Manufacturers and Traders at Olympia fully upholds its reputation, and is one of the finest displays of motor carriages that has ever been brought together. Its only fault is that the size of the building prevents all the cars being shown that might be, and does not afford enough accommodation for all the people desirous of seeing them. It is particularly the electrical features that we wish to treat of here, and it may be said at the outset that there is more of electrical interest than there has been in recent years, showing that the applications of electricity to automobile engineering are on the increase, especially as regards what may be termed auxiliary services, and in particular in the direction of electrical engine starters.

## An Edison Battery Car.

Regarding electric traction *per se*, there is but one example—the Arrol-Johnston coupé with the Edison battery—while the lead traction battery is again, as it has been for some years, unrepresented. It is also notable that examples of electric transmission gear are entirely absent, but in considering these facts it must be remembered that the exhibition is limited to private passenger cars, while the field in which the greatest progress is being made both with accumulator and “petrol-electric” traction is that of heavier commercial vehicles. How far the Edison battery will modify this remains yet to be seen.

The Coupé equipped with the Edison battery, shown by the Arrol-Johnston Co., is a car of the same type as that which completed a run from Dumfries to London last summer (see ELECTRICAL ENGINEERING, June 5th, page 320). It has a handsome closed body driven from inside, and is propelled by a single enclosed motor mounted about the centre of the chassis, and driving through worm gear on to the back axle. The motor has a cast-steel carcass and laminated pole pieces, and is said to be rated at 35 amperes at 60 volts “normal load,” and to be capable of 300 per cent. overload for  $\frac{1}{4}$  hour and 100 per cent. for one hour. It runs at speeds up to 1,200 to 1,400 r.p.m. The control is as simple as possible, plain series resistances are used for the first few steps. As there is only one motor with a single commutator, series parallel control cannot be made use of, nor is there any alteration in the grouping of the cells, which are kept permanently in series. The characteristic of the motor, however, enables quite steep hills to be taken on the top controller notch, so that the resistances are rarely in circuit except at starting. The controller is of the drum type, and is operated by a lever conveniently placed under the steering wheel. It is interlocked with the main switch, and the latter can be locked open, when it can only be released by a Yale key. The battery is composed of 60 cells stowed partly under the forward bonnet and partly in the rear of the vehicle, so that the lines of the body are in no way spoilt. We are told that the battery is rated at 120 ampere hours at 65 volts, and we understand that in ordinary running a distance of 35 to 60 miles can be covered on one charge, according to circumstances. A Sangamo ampere-hour meter shows the condition of the battery at any time. The weight of the vehicle complete is about 27 cwt. The chassis weight is given at 17 cwt., or about 2 cwt. heavier than the Arrol-Johnston 15-h.p. petrol chassis, and we are given to understand that from 9 to 10 cwt. is the actual weight of the battery. Those unfamiliar with the construction and working of the Edison alkaline nickel-iron battery may be referred to detailed articles which appeared in ELECTRICAL ENGINEERING, Oct. 12th, 1911, Exhibition supplement, page 67, and May 19th, 1910, page 319, and to Messrs. Watson and Mitchell's Paper read last summer before the I.M.E.A. (ELECTRICAL ENGINEERING, June 26th, page 377).

Although as already remarked there is not an example of electrical transmission gear, attention should be called to an application of electricity in gear changing of a novel nature shown on the latest type of Cadillac cars. Here there are two separate bevel gears of different ratio in the back axle, and the change from one to the other is controlled electrically. This is not done by magnetic clutches, as we have seen it stated, but the actual shifting of the necessary striking rods is done by a pedal, while solenoid controlled locks select which rod is to be actuated.

## Electrical Engine Starters.

Perhaps the most interesting feature of the exhibition from the electrical point of view is the greatly increased number of electrical engine starters on view. Last year there were only two or three examples, but now we find not only a

considerable proportion of the cars in the body of the hall fitted with these devices, but several systems exemplified in the accessories section in the gallery. A few cars even dispense with the ordinary starting handle altogether. The compressed air starter has not made anything like the same progress, and very few examples are to be seen. A number of the foremost makers, including such prominent firms as Napier and Rolls-Royce, are entirely without these fittings on their cars, and in some cases their application is somewhat tentative, as if makers were yet undecided whether a self-starter is a refinement or a complication. The problem is not as easy a one as it might appear; there is a tendency to overtax the battery if of the ordinary size used for lighting, and the mechanical connection and disconnection of the starting motor to the engine calls for some ingenuity. In some cases, the same electrical machine is made to do duty as a lighting dynamo as well as a starting motor, but the general tendency on the whole is to keep the machines entirely separate, with a view to greater reliability and simpler switchgear, even at the expense of some increase in weight. In one notable case, however, weight is saved by making the starting motor armature an integral part of the flywheel.

The pioneers of electrical starters, as far as their introduction into this country is concerned, were the Cadillac Co., and the Delco starter on their cars is practically the same as that shown last year, but has been simplified by the substitution of a brush-lifting arrangement instead of a change-over switch to put the dynamo or motor armature winding into action respectively. It will be remembered that this set belongs to the class in which the same machine acts as starting motor and charging dynamo, but separate armature windings and commutators are used for the two purposes. The drive is by a pinion on to teeth cut in the engine flywheel, and the whole machine slides sideways into engagement with this while the starting pedal is pressed, returning to its engagement with its drive for dynamo purposes at the other end of its shaft when the pedal is released. The appropriate electrical connections are interlocked, so that the motor starts to move slowly round before the pinion goes into gear, thus facilitating its engagement. The Delco starter is also in use on the Lanchester cars.

Another electrical starter of American origin is that of the Westinghouse Co. shown on the Hupmobile stand. Here a clutch is inserted between the motor and the driving pinion with the double purpose of enabling the motor to get away before taking up its load, so as not to draw too big a current rush from the battery and of facilitating engagement of the pinion. In this set an entirely separate machine is used for charging the battery.

An ingenious arrangement for engaging the pinion with the teeth on the flywheel is adopted in the new Brodt starter, shown in the gallery, where the starting of the little motor draws the pinion sideways into engagement by the action of a helical sleeve cam. By this means the pinion is quite free at the moment of engagement, as the drive is only taken up when the cam is at the end of its travel and the teeth fully engaged. The system is thus very free from mechanical complication, and the only manipulation required is the switching on of the motor. As soon as the engine gets away, the gear springs out automatically. The motor in this case is plain series wound, and, of course, a separate charging dynamo is used. In the Rushmore set (shown on the Seabrook and other stands as well as in the gallery), which is also an example of pinion drive on to the flywheel from a motor used only for this purpose, the whole armature—shaft, pinion and all—slides sideways. It is held out of gear by a spring when not in use, but the switching on of the motor pulls the armature sideways into the position of strongest field and engages the gear. As soon as the engine gets away, the pull between the armature drops and the gear springs out, nor does it tend to re-engage, as the current taken to spin the motor light is insufficient to draw the gear in.

As we have already seen to some extent, the attempt to make the same machine suitable for both starting motor and charging dynamo introduces several problems. The difficulty of making a machine fulfil both conditions with the same winding is met in the Scott starting system (shown on the Crossley stand), by allowing it to drive as a motor through a 20 to 1 epicyclic reduction gear as well as a chain. When the engine gets away, the brake on the epicyclic gear is released and the whole goes round solid, allowing the engine to drive the dynamo at a suitable speed. The set, which was exhibited last year, was referred to in ELECTRICAL ENGINEERING, Nov. 21st, 1912, page 651. A chain drive is also used on the White starter, which also embodies a combined motor and dynamo, and is one of those appearing for the second time. Some of the Vauxhall cars are fitted with Tattersall's patent “T.A.T.” starter, also shown in the gallery by Imperial Motor Industries. This appears to be well thought out in detail, and is also of the combination class employing a main chain drive to a single machine, which works through an epicyclic gear when used as a starting motor. The epicyclic gear is magnetically actuated, and the whole operation is controlled by pressing one button on the dashboard.

The new C.A.V. starter of Vandervell & Co. is shown on a

number of cars, including Daimler, Austin, Darracq, and Humber, as well as on their own stand in the gallery. This is different from all three that we have described hitherto, in that a friction drive is employed. The motor is rigidly attached to the chassis, but drives through an extended shaft with two universal joints. The friction pulley is pressed into contact with the flywheel mechanically by a pedal before the motor is switched on. Friction drive is also employed on the Bosch starter fitted to one of the De Dion cars, which drives on the inside of an extension of the flywheel rim.

Many of the arrangements described above can be easily fitted to any completed car, but an example of a starting gear forming an integral part of the chassis is shown in the S.E.V. system on one of the Delahaye cars. Here the motor drives on to a worm gear inside the gear-box, so that the engine is started with the clutch engaged and the gear out, and a free-wheel arrangement comes into action as soon as the engine gets away.

Perhaps the most interesting new departure in the way of electrical starters is the "U.S.L." starter (of the United States Lighting & Heating Co.) on the Sheffield-Simplex cars. Here the questions of the extra weight of the starting and of its gearing are boldly solved by making the armature form the flywheel itself. This is constructed to overhang a fixed field magnet system of eight radial poles, and carries a large commutator. The machine is used as a lighting dynamo as well as a starting motor.

### Electric Car Lighting.

The year's progress in car lighting equipments has been considerable, not so much in the introduction of new patterns of apparatus, but in the conversion of the novelty into standard practice. Following the introduction of the metal filament lamp, motor-car lighting has quite come to its own. Practically every car in the show is now fitted with electric light, and the use of small dynamos to keep the accumulators charged is almost universal. We have not the space to describe all the numerous sets shown in detail. There are no very striking novelties in principle, but the details of the machines, switchboards, fittings, wiring material, &c., are much improved, and several new firms have taken up this class of work. Again, it is noticeable that firms which formerly made only one size of equipment now have several on the market to cover all requirements. Car manufacturers are also making better provision for the accommodation of the machines, which figure now more as part of the chassis design than as afterthoughts.

One of the newest systems is that of the Bosch Magneto Co., where a special dynamo gives a suitable voltage over a very large range of speed in conjunction with a voltage regulator and cut-out in the switch-box, and here it may be remarked that, on the whole, electrical cut-in and cut-out arrangements are more used than mechanical devices for the same purpose. The C.A.V. system, in which a free-wheel arrangement allows the dynamo to run as a motor when the driving speed is too low, is well to the fore, and among other systems shown which have already been described in our columns may be mentioned the Blériot, Broit, Lucas, Lodge, Trier and Martin, Mira and Rotax-Leitner. The new Lithanode system employs a ballast resistance to regulate the voltage, and another new-comer is the French S.E.V. system with magnetic cut-out, seen on the Delahaye cars. Several systems in which the dynamo is combined with the starting motor have already been mentioned.

### Ignition and Accessories.

There is little novelty in ignition devices. Accumulated experience has rendered the high-tension magneto so reliable that its use is now practically universal and the provision of an alternative battery and coil equipment is now rarely regarded as necessary. Electric horns are also very largely used, and the fine work in the construction of the diminutive motor in the famous Klaxon horn is worth examination. Numerous other small electrical accessories such as special terminals, pocket voltmeters, signalling apparatus from the inside to the driver, &c., &c., are on view, and confirm one's impression that the keynote of the exhibition is completeness and improvement in well-thought-out detail.

**Italian Supply Companies.**—The *Board of Trade Journal*, quoting from a German source, states that of the twenty-eight Italian electric supply undertakings, only two in 1912, compared with three in 1911, paid no dividend, whilst fourteen paid the same dividend, nine paid more, and only three less dividend than in 1911. The average increase of dividend was from 6.56 to 6.69 per cent., or 0.13 per cent.

**Electric Baths.**—The L.C.C. has been recommended to apply to Parliament next session for powers to control electric baths establishments. This matter, it will be remembered, assumed importance in connection with the death of a solicitor in an establishment in Cavendish Place, London (*ELECTRICAL ENGINEERING*, Vol. VIII., Nov. 14th, 1912, page 658), when the evidence went to show that the treatment was administered by a non-technical person.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS :** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS :** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,364.

How is the electrical equipment connected in a petrol-electric car, the engine being 40 horse-power, the dynamo being compound wound with interpoles, and the motor being series wound with interpoles. Show in the diagram how two different speeds are obtained by the shunt and series resistances and the reverse control, and state what efficiency of transmission should be expected.—"ELECT. EQUIP."

(Replies must be received not later than first post, Nov. 20th.)

### ANSWERS TO No. 1,362.

No reply worthy of an award has been received.

**Explosion in New York Generating Station.**—The explosion which occurred on October 22nd in the Livingston generating station of the Richmond Light and Railroad Co. (of Staten Island, New York), in which seven men were killed and three injured, already referred to in *ELECTRICAL ENGINEERING*, we now learn from the American technical journals, originated in a 330 h.p. vertical water-tube boiler. A 60 ft. hole was torn in the roof of the boiler house, and a large part of the breeching carried away, so that the remaining boilers were cut off from the stack. An old railway generating station has been put into commission again. The building has now been repaired, but we understand that Staten Island was without light for five nights.

**Imperial College of Science and Technology.**—A well-bound booklet of 48 pages has recently been produced, dealing with the manifold departments now comprised in the Imperial College of Science and Technology at South Kensington. Courses on biology, chemistry, geology, mathematics and mechanics, and physics, are held at the Royal College of Science, while metallurgy and mining are taught at the Royal School of Mines, and civil, mechanical, and electrical engineering are concentrated in the City and Guilds (Engineering) College. The booklet points out that the Governors now award annually 12 entrance scholarships in science, six to be held at the Royal College of Science and six at the City and Guilds (Engineering) College. The booklet then proceeds to set forth the main features of the courses, the requisite training for different engineering branches, and it gives some idea as to the openings offered at home and abroad, together with their monetary value. In this respect at the present time the mining and metallurgical industries are particularly attractive. The comprehensive courses in civil and mechanical engineering of the City and Guilds (Engineering) College are well known, as is the course in electrical engineering under Professor T. Mather. In addition to the full course of three or four years, advanced specialised lectures are given by leading exponents, and there are extensive facilities for those wishing to carry out original work. The booklet should prove of assistance to those seeking a career in the engineering or allied professions, and to demonstrate the importance of the work being carried on at the Colleges. The Rector, Sir Alfred Keogh, or the Secretary, Mr. A. Crow, will be pleased to arrange for anybody to be shown over the buildings by appointment.

### STEAM BOILER WORKING

A PAPER entitled "Steam Boiler Working in Electrical Power Stations" was read by Mr. J. W. Jackson before the Newcastle Section of the Institution of Electrical Engineers at Newcastle on Monday, and will be read at Middlesbrough to-morrow. The Paper is divided into three sections. The first deals chiefly with superheaters, the second with boiler furnaces, the third with stoking gear.

The author points out that an important consideration in the case of boilers for electric power stations is the liveliness of the boiler for dealing with variations in the load. In this connection the water-tube boiler takes only about thirty minutes to raise steam at full working pressure from cold water, whereas with the big cylindrical type of boilers several hours are required, while the ordinary Lancashire type of boiler does not permit of forcing to the same degree as the water-tube boiler. In connection with superheaters, modern competition appears to have called for a superheater of smaller area, but placed in a much hotter portion of the furnace, with the result that the tubes are overheated, and therefore have only a short life and are difficult to keep in position. The superheaters designed ten years ago are free from these objections. In this case the whole of the gases pass through the superheater after having passed the water tubes. To reduce the superheat some of the gases are bypassed. The more modern superheater does not usually vary the path of the gases at all, but shunts more of the saturated steam past the superheater. This calls for a smaller quantity of steam passing through the superheater, with the result that a lesser degree of heat is transmitted to the steam, thereby allowing the superheater-tube temperature to rise so high that corrosion or oxidation occurs inside and outside the tube. It is usually fixed between the main water tubes of the boiler, with the result that "sooting" of the boiler becomes a difficult matter, and soot may clog up portions of the path of the gases. The more generous superheater, fixed beyond the first bank of tubes, being of larger size because of the lower temperature of the gases, is much less sensitive to the fouling of the passages by soot. Higher superheat is required now than formerly, with steam temperatures, possibly up to 900° F., at the turbine stop valves. The author does not think that there is any disadvantage in making superheaters with bent tubes providing that the water can gravitate to a header, but there is always a considerable risk if the superheater has to be blown out before the boiler can be put on load. The superheater should therefore be kept well above the boiler water line, and, in operation, should be considered a portion of the main steam-pipe. Another trouble with the modern superheater is that owing to its comparatively small surface a drop in pressure from 10 to 15 lb. per sq. in., compared with 5 to 7 lb. in the older superheater, takes place at the normal full-load rate of working. With regard to the position of the main steam drums, if these are parallel to the path of the gases, then the front should be at a higher level than the back, while if they are at right angles to the flow of the gases, then the front drum should be elevated and the back drum lowered in comparison with the centre drum, as in practice there is often a difference in water level at normal load of about 12 in. between the front and back drums. Priming will by this means be reduced, and as a result the corrosion in the top parts of the steam drums and superheater tubes, which is possibly due to the comparatively small steam space available in the drums. By painting the internal surfaces of boilers and tubes where possible with bitumastic paint corrosion is easily prevented.

In connection with his remarks on boiler furnaces the author deals with the subject of combustion and the design of the various parts. A good furnace is one that allows plenty of room for combustion, and in which the fire is surrounded as much as is necessary with refractory lining, so as to permit of the high temperature being obtained through complete combustion before the flame or hot gases are allowed to come into contact with the heating surfaces, and that is almost the only value, but a very important one, that fire-

bricks have in the furnace. With regard to the surface combustion furnaces of Professor Bone and Dr. Nicholson, the latter may possibly be of greater commercial importance on account of the ability to use commercial boilers after the gas paths have been rearranged, whereas the former requires specially cleaned gas from a gas-producer plant. Although from 2 to 4 per cent. of the total power developed by the boiler is required to drive the auxiliaries such as the fan, &c., it is claimed that boilers working in commercial practice are giving over 90 per cent. thermal efficiency, and an evaporation per sq. ft. of heating surface of 35 lb.

After outlining the progress made in the design of mechanical strikers and pointing out that different designs are required with different fuels if the best results are to be obtained, the Paper concludes with a description of the suction ash handling plant, described in *ELECTRICAL ENGINEERING*, March 7th, p. 113, and July 25th, 1912, p. 421, Vol. VIII.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The Annual Report of the Postmaster-General for the year ended March 31st last gives a good deal of statistical information regarding the telegraphs and telephones. With regard to engineering developments, it is reported that the underground telegraph line from London to St. Margaret's Bay and Abbot's Cliff, the landing place of the French and Belgian cables, is nearly completed, and provision has been made for an extension from Canterbury to Dumpton Gap during 1913-14. Part of a line from London to the landing places of German and Dutch cables on the east coast has been laid between London and Chelmsford, and provision has been made for its extension to Ipswich and for a cable to be drawn in during 1913-14. The use of phantom circuits has been extended where possible. Morse circuits superposed on trunk telephone circuits have been provided, for example, between Aberdeen and Dundee and between Dundee and Newcastle, and have proved satisfactory. As, however, many telephone trunk circuits are being made junction circuits, and as superposition on junctions is not at present practicable on account of engineering difficulties, the field for extension of phantom circuits is being so far reduced. The system of testing telegraph and telephone circuits has been reorganised with a view to the more prompt localisation and clearing of faults, and to prevent delay, special "speaking" circuits have been formed between some of the larger towns (by superposition and otherwise) for the use of testing officers. Multiplex working by means of the Baudot type of instrument is being extended in the service with the Continent, with satisfactory results. In the section devoted to wireless telegraphy reference is made to the International Conference and to the inquiry into the Marconi contract, which was being conducted at the end of the period under review. It is mentioned that the number of radio-telegrams dealt with at the Post Office Coast Stations during the year was 51,109 (43,650 inwards, 7,459 outwards), as compared with 44,507 last year, and that during the year 729 new licences, covering 869 stations, were granted for the purpose of experiments, while 45 licences for experimental stations were cancelled or expired. In 23 cases permission to conduct temporary experiments was given by letter. On the 31st of March last there were in existence 942 licences for the purpose of experiments, as compared with 258 on the 31st of March, 1912. The number of licences in operation on the 31st of March last for wireless telegraphy on board ships registered in the United Kingdom was 105, covering 646 ships, as compared with 72 licences, covering 450 ships on the 31st of March, 1912. The Post Office is taking over the War Office station in Guernsey, which will be rebuilt and used for communication with the Bolt Head station when the Channel Islands cable is interrupted. In the telephone section, the result of the arbitration proceedings in connection with the purchase

of the National Telephone Co.'s plant is recapitulated. The only systems of telephonic communication in the British Isles which are not at present worked by the Postmaster-General are those worked by the States of Guernsey and the Corporations of Hull and Portsmouth. In the case of Guernsey negotiations have been in progress with the States for the renewal of their licence for a period of fourteen years. The Hull Corporation are anxious to obtain a renewal of their licence and are, we understand, prepared to purchase the system taken over from the National Telephone Company in the Hull area as a condition of such renewal. Negotiations on the subject were proceeding at the end of the year. In the case of Portsmouth the existing licence to the Corporation does not expire until 1926; but the Corporation do not desire to carry on the system in competition with the Post Office, and negotiations have been in progress with a view to its purchase by the Post Office. In the course of the year, exchanges equipped with automatic telephone plant were opened at Epsom and at the General Post Office, London, and are giving a satisfactory service. The work of providing automatic exchanges at Newport (Monmouthshire), Darlington and Hereford is in progress, and the installation of similar equipment in other important centres is contemplated. A type of automatic equipment which may be suitable for use in small isolated centres is to be tried at Chepstow. A new telephone exchange, known as the "Park" Exchange, has been opened at Notting Hill, and new exchanges are in course of erection near the British Museum and Victoria Station and at Greenwich. Sites have also been acquired for other exchanges in London. A start has been made with the building of a new central telephone exchange at Leeds, and considerable progress has been made with the extension of the Edinburgh Central Exchange. Arrangements are almost complete for the institution of a telephone service between London and Basle, Geneva, and Lausanne. Negotiations are proceeding with the Dutch Administration for the joint provision of a direct Anglo-Dutch Telephone Cable. The possibility of affording telephonic communication between Germany and this country is under consideration.

A Paper by Mr. A. K. Erlang, entitled "New Alternating-current Compensation Apparatus for Telephonic Measurements," has been accepted by the Institution of Electrical Engineers and published in the current *Journal*. The apparatus has been in considerable use at the laboratory of the Copenhagen Telephone Co., and consists of two calibrated slide wires of about 50 ohms resistance each and calibrated with a central zero. These wires are connected at their ends through a self-induction of about 0.01 henry and 3 ohms, and a 3-ohm non-inductive resistance. The junctions of the inductances and resistances are connected through the primary of an air-core transformer and an alternator. The mutual inductance between the primary and secondary of the transformer is adjustable by moving the position of one of the coils. A telephone receiver and sliding contacts on the slide wires, together with a junction board, are provided. The apparatus under test is connected through the telephone to the slide wires. For impedance measurements, the unknown impedance is con-

nected with a known resistance in series with the secondary coil, and by compensation the pressure across the resistance and the impedance is determined, and the corresponding vectors may be obtained from a scale constructed for the pressure along the slide wires depending on the known constants of the circuits. Thus the attenuation and wave-length constants may be found. Slight modifications in the circuits may be made for the purpose of different tests, including tests on microphones.

The first of the series of Advanced Lectures on Wireless Telegraphy which Mr. J. St. Vincent Pletts, A.C.G.I. (Chief of the Patents Dept. Marconi's Wireless Telegraph Co., Ltd.), is giving at the City & Guilds (Engineering) College to a large number of engineers and past and present students, was delivered on Thursday evening last. Mr. Pletts commenced by considering the oscillations set up by the discharge of a condenser through resistance and inductance, and the ethereal radiations thereby resulting. He considered the mathematics of the circuit, and developed the formula,  $C = V \sqrt{K/L} \sin t \sqrt{LK} e^{-\delta t}$ , where  $C$  is the current at any time,  $V$  the voltage,  $K$  the capacity in farads,  $L$  the inductance in henrys, and  $e$  the base of the natural logarithms,  $\delta$  the logarithmic decrement, and  $f$  the frequency. He showed also that  $\lambda = 2\pi \sqrt{LK}$ , where  $\lambda$  is the wave length in metres,  $L$  the inductance in electromagnetic units, and  $K$  the capacity in electrostatic units. Although, he said, it was usual to reckon the waves useful until they had died away to 100th part of the maximum, yet in actual practice they were not useful when they had died away to one-tenth. He then dealt with the development of the simple circuit considered by the inclusion of a spark gap which acts as an automatic switch, and showed how by opening the plates of the condenser and considering the inductance produced by the straight wires, we ultimately get to the simple aerial. He then showed how, considering one charge, the line of force spreads out through the ether back to the corresponding negative charge on the other side of the gap, and as the charges travel backwards and forwards from the gap the lines are radiated into space. Finally he showed how the potential along an aerial must be distributed according to an odd number of wave lengths, as there is always a node at the earth and an antinode or point of maximum potential at the top. He illustrated this by a hanging chain held in the hand which could be made to give one, two or three nodes, whereas a simple pendulum can swing from one point only. This, he pointed out, was analogous to an "oscillator," in which the inductance and capacity were concentrated, while the chain was analogous to the case where the inductance and capacity were distributed. With the chain, however, the nodes are not equidistant, as is the case in a simple aerial. We may mention that the next lecture will be given to-day, at 5 p.m., and will deal with development of wireless telegraphy, long-distance difficulties, atmospherics, and absorption.

Mr. A. A. Campbell Swinton has accepted the position of President of the newly-formed Wireless Society of London (ELECTRICAL ENGINEERING, September 25th, p. 547). The

Vice-Presidents now include Mr. W. Duddell, Dr. Silvanus Thompson, Dr. J. Erskine-Murray, Mr. Charles Bright, Mr. F. Hope-Jones, and Mr. Russell Clarke. It is expected that the society will have 500 members by the end of the year.

It is announced that Marconi's Wireless Telegraph Co. has inaugurated the duplex system of working between Canada and Ireland.

The Committee recently appointed by the Postmaster-General to consider how far and by what methods the State should make provision for research work in the science of wireless telegraphy, and whether any organisation which may be established should include problems connected with ordinary telegraphy and telephony, is to be constituted as follows:—The Right Hon. C. E. H. Hobhouse, M.P. (Chairman); Lord Parker of Waddington; Sir Joseph Larmor, F.R.S.; Sir Henry Norman; Dr. R. T. Glazebrook, F.R.S.; Mr. W. Duddell, F.R.S.; Mr. R. Wilkins, C.B.; Rear-Admiral E. F. B. Charlton; Commander J. K. Im Thurn; Sir Alexander King, K.C.B.; Mr. W. Slingo; Commander F. Loring; Major the Hon. H. C. Guest. Its offices will be 6 Catherine Street, Strand, W.C.

The land lines in San Domingo have been repaired, and telegrams for San Domingo, Curaçao, and Venezuela can again be accepted under normal conditions.—The Ceara-Maranhaur cable was repaired on the 10th inst.—Telegrams in code can once more be accepted for Bulgaria.

### ELECTRIC TRACTION NOTES

A long and interesting paper on "Electric Locomotives," by Mr. F. Lydall, has been accepted by the Institution of Electrical Engineers and published in their *Journal*. The author first gives particulars of 28 designs of locomotives in use and under construction, showing the great diversity in present practice, and then proceeds to discuss the style of construction best suited to different classes of service, paying particular attention to capital cost, maintenance expenses, effect on the track, liability of skidding, and good look-out position for the driver. After a full discussion of these points, the author makes the following tentative recommendations:—A shunting locomotive may be of the double bogie design with a total weight of about 60 tons, equipped with four standard geared motors with an aggregate capacity of about 600 h.p. on the one-hour rating. It should be of the steeple type, with central driver's compartment and sloping ends. Freight locomotives may also be of the double-bogie steeple type, as the maximum speed is not required to exceed 45 miles per hour. It will be equipped with four geared motors with an aggregate capacity of about 1,200 h.p. on the one-hour rating. For local passenger locomotives with speeds up to 65 miles per hour, it is advisable that leading and trailing radial axles, or single-axle trucks, should be provided. For the driving axles several alternatives suggest themselves. For purposes of adhesion, two driving axles carrying 16 tons per axle should be sufficient. These two axles might perhaps be driven by two pairs of geared motors, each pair geared to a single gear-wheel. If the large number of motors were objected to, the alternative would be to dispense with gearing altogether and to drive by means of connecting rods. A single motor of 1,100 h.p. could easily be built with an armature of this size, and could be connected to the driving axles through the intermediary of a jack shaft. Or it would be possible to use two 550-h.p. motors running at a comparatively low speed, both coupled to a central jack shaft between the driving axles. An express passenger locomotive should have leading and trailing two-axle bogies, and three driving axles. To permit of high speeds being attained, the driving wheels should have a diameter of not less than about 60 in. The equipment may then consist of two 1,200-h.p. motors, probably mounted in the body of the locomotive and driving together on to a jack shaft between the central and one of the outer driving axles. A possible alternative is to connect the two motor axles to the central driving axles by Scotch yokes.

An article in the *Railway Gazette* deals with some troubles which have been experienced on the Wiesenthal Railway. The difficulties are of a different character from those experienced on the Loetschberg line, and are solely concerned with the single-phase locomotives. The trouble, however, has nothing to do with the merits or demerits of single-phase traction as compared with other forms, but is due to mechanical difficulties in the connection between the motor and the wheels. The ten original 2-6-2 locomotives have two elevated motors which work on to a jack shaft by connecting rods on both sides of the locomotive. It will readily be

seen that use of rods at both ends of the motor shaft entails strict parallelism of all six shafts, and that any play and any twisting of the jackshaft through the irregularity of the turning movement can produce great stresses in the rodding. As a matter of fact this was the case, and abnormal wear making the situation still worse took place. The trouble is to some extent avoided in the two locomotives subsequently constructed by a kind of guide frame connection at the lower end of V connecting rods from the motors. This allows of sufficient play to enable the jackshaft to be dispensed with and the drive to be taken on the centre wheel. The ten original locomotives are being altered on these lines. It is said that somewhat similar troubles have been experienced on the Dessau-Bitterfeld Railway.

Some particulars of the most recent design of roller trolley and pantograph, which has been adopted for use on several heavy traction high-pressure D.C. lines in America, is given in the *Electric Railway Journal*. The roller is mounted on a pantograph frame, and weighs, complete with spindle, 28 lb. The wearing surface is a tube of non-arc-ing brass, supported on a wooden roller. The height of the trolley wire above the head of the rail varies from 14 ft. 6 in. to 22 ft., yet, owing to the pantograph construction, the pressure of the roller against the wire is kept practically constant at about 84 lb. The average mileage of the rollers is 55,000. The cost of manufacture on a large scale is \$6.62 each.

A meeting of the Metropolitan Association of Electric Tramways Managers, was held recently at the Municipal and County Club, Whitehall Court, at which Messrs. Ullmann and Coveney were re-elected Chairman and Vice-Chairman respectively, and Mr. T. B. Goodyer was re-elected Hon. Secretary.

A dispute has arisen between the Sunderland District Tramways Co. and the Newcastle-on-Tyne Electric Supply Co. in regard to the price to be paid for electric current, and as there is a disputed bill amounting to £1,800, the power company some time ago threatened to cut off the supply. In the Chancery Division recently the Tramways Company asked for an injunction to prevent this pending the trial of the action, and after some discussion it was agreed to adjourn matters for a week.

A comprehensive tramway scheme for linking up all the villages between Barnsley and Mexborough is likely to come before Parliament next session. The consulting engineers to the scheme are Mr. Stephen Sellon and Mr. J. B. Hamilton, General Manager of the Leeds Corporation Tramways.

The consent of the Board of Trade to the running of trailer cars on the L.C.C. Merton circular route which was given for three months on June 7th, has now been extended "for the present" without any definite limit.

The scheme for linking up North and South Shields by means of an electric railway under the Tyne has once again been revived, this time at the suggestion of some American promoters. It is probable that Parliamentary powers will be sought next session. A Bill was passed in 1902, but the powers lapsed.

The negotiations between the Oxford Corporation and the National Electric Construction Co. with regard to the tramways scheme have not borne fruit, and the proposal of the Company to make use of petrol-electric tramcars has been rejected by the Corporation after a very full debate. The question of issuing a writ against the Company for the recovery of the liquidated damages under the various Acts is yet to come for consideration.

**Waste.**—The inaugural address of Mr. W. B. Woodhouse to the Yorkshire Local Section of the Institution of Electrical Engineers, delivered last Thursday, pointed out once more the wastefulness of burning coal in the ordinary way and the advantages of process of power production which at the same time rendered valuable by-products available. An example of co-operation between an electric supply company and industrial processes of this nature was presented by the coke ovens of the Old Silkstone Collieries, which now worked in conjunction with the Yorkshire Electric Power Co. In this case the surplus gas produced was 2,000 kw., which was distributed to the power customers of the Company. He also referred to the advantages of electricity for domestic purposes, and said that in the future distribution of energy, electricity must take a predominant part, but its progress was not solely controlled by engineering problems, but one must also consider the legislative and financial conditions under which the supply of electricity must be developed. The first step must be to obtain a better understanding between State departments, municipalities and power companies. Like Mr. Vernier, in his address at Newcastle, Mr. Woodhouse thought that there might be financial cooperation between power companies and municipalities.

## Over 30 years' manufacturing — experience is behind — SILVERTOWN Electrical Plant

The India Rubber, Gutta Percha & Telegraph Works Co., Ltd. (The SILVERTOWN Company) were the first to manufacture Gramme machines in England, and have had considerable experience in the construction of Dynamos, Motors, Balancers, Boosters, Motor Generators, Rotary Converters, Petrol-Electric Plant for Private House, Hotel and Ship Lighting and Power, Switchboards, &c.

The **SILVERTOWN** Company

have executed many important contracts for British and Foreign Governments and Corporations.

### SILVERTOWN MACHINES

are noted for efficiency and a high standard of workmanship and finish.

## LOCAL NOTES

**Aberdeen: Lighting of Infirmary.**—Some dissatisfaction is being expressed in the local papers at the alleged attempt of the Corporation with regard to an application by the Aberdeen Royal Infirmary for a supply of electrical energy for driving laundry machines. The Infirmary has its own electric power plant but, in order to avoid extending it, applied to the Corporation for the necessary current to drive the new laundry machines. Although the terms proposed by the Corporation have not been made public, it is suggested that they practically impose upon the Infirmary the necessity of scrapping the existing plant and taking all power from the Corporation.

**Bispham: New Power Station.**—The Council's station was formally put into operation last week. The equipment consists of National gas-engine driven sets. The Consulting Engineer was Mr. J. W. Speight.

**Derby: Opening of New Showrooms.**—A large new show-room where there is a fine display of fittings for lighting, heating and cooking, has been opened by the Electricity Department at Victoria Buildings, London Road. This show-room will also act as a central bureau for information, and be the headquarters of the Canvassing Department.

**Ilford: Electricity Accounts.**—The accounts for the year to March 31st show a surplus of £521, as compared with £1,602 in the previous twelve months. The decrease in the net profit is due to (1) extra expenditure on coal due to the coal strike; (2) reduction in price of current for traction, which accounted for £250; (3) loss of revenue due to limitation of supply for several days in consequence of the fire at the Works in September, 1912. The interest and loan charges are also £300 more than in the previous twelve months. From the end of the December quarter current is to be supplied for domestic purposes at 12½ per cent. on the rateable value of private houses plus ½d. per unit for all energy consumed.

**London: Hammersmith: Additional Coal Storage.**—Arrangements are being made for increasing the coal storage at the electricity works to a capacity of 6,000 tons.

**Llandudno: Electric Heating.**—It has been decided to install electric heating and ventilating plant in the Pavilion.

**Manchester: Wiremen's Strike.**—We are officially informed that at a joint meeting of the employers and operative electricians, held at the employers' board-room on November 4th, an agreement was come to granting the men out on strike ½d. per hour extra on condition that in future six months' notice be given before any change in the terms of employment can be made. We gave particulars of the reasons for the strike on p. 609 of our issue for October 30th.

**Purchase of Trafford Power Co.**—The proposal of the Manchester Corporation to purchase the Trafford Power & Light Co., as already announced in these columns, is to be opposed by the Stretford District Council.

**Market Weighton: Electric Supply.**—Mr. C. Pullan, Electrical Engineer, of Bradford, has approached the Council with a view to instituting an electric supply scheme.

**Rathmines: Electric Wiring.**—A sum of £1,500 is to be set aside from the recent loan of £11,000 for wiring consumers' premises.

**Sedbergh: Electric Supply.**—Mr. C. Pullan, Electrical Engineer of Bradford, has approached the Council with a view to instituting an electric supply scheme.

**Southport: Electricity Accounts.**—The past year's working on the electricity undertaking shows a net profit of £1,902, which is £249 less than in the previous twelve months. The number of units sold to the Corporation tramways was less by 32,150, and to the Tramways Co. by 13,545.

**Taunton: Supply to Small Houses.**—A number of workmen's dwellings recently erected by the Taunton Corporation have been fitted for electric lighting. The rent of 4s. per week includes the necessary supply of electricity for lighting one lamp in the living room.

**Wisbech: Electric Lighting.**—A Board of Trade inquiry is to be held regarding the site selected by the Wisbech Electric Light & Power Co. for the erection of its generating station.

**York: Cost of Street Lighting.**—As an argument in favour of extending public electric lighting, attention was called at the last meeting of the Corporation to the fact that in York, which is at present largely lighted by gas, the cost per mile of street lighting is considerably higher than in Yarmouth, where there is a much larger proportion of electric lighting.

## APPOINTMENTS AND PERSONAL NOTES

Mr. P. J. Boucher, who has for some three years acted as Traction Lamp Expert to Messrs. Siemens Bros. Dynamo Works, Ltd., has been appointed to a similar position with Messrs. Edison & Swan United Electric Light Co., Ltd., in London.

An electrical engineer is required for taking charge of light installation work, also maintenance, estimating capacity and knowledge of motor-car lighting systems. (See advertisement on another page.)

Mr. L. B. Hogarth, Borough Electrical Engineer, Morecambe, has been appointed to a similar position at Whitehaven at a salary of £250, in succession to Mr. B. Sankey recently resigned.

Mr. W. W. Firth has been appointed Mains Superintendent at Dewsbury in succession to Mr. H. Fowles at a salary of £2 rising to £2 5s. per week.

Two foremen electricians are required by the Bombay Government to act as technical instructors. Director-General of Stores, India Office, S.W.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &amp;c.

**Edison & Swan United Electric Light Co.**—After providing for interest on both classes of debenture stock, and depreciation upon freehold properties and plant, there was a loss of £4,753 on the year's working to June 30th. After providing for various depreciations there is a credit balance in the net revenue account of £1,026, which is carried forward. This unfortunate result is attributed mainly to the fact that the sales of metal filament lamps last winter were to a large extent suspended in consequence of the difficulties between the owners of the drawn wire patents. This matter, however, has now been adjusted. The directors have made a careful valuation of the whole of the lamp stocks, and various other assets, and in order to write off obsolete plant and stocks, &c., a sum of £48,013 has been required. In order to meet this, the reserve fund, amounting to £45,000, together with an amount of £3,013 from the sum brought forward from last year, has been allocated for the purpose of leaving the credit balance of £1,036 already mentioned. The South Benwell Lamp Works have been closed down, and all lamp manufacture concentrated at Ponders End. The premises in College Hill, used as a showroom and stores, will also be closed down when the new premises in Queen Victoria Street are ready for occupation.

At the annual general meeting on Tuesday, Mr. C. J. Ford (Chairman of the Company) said that although on the face of it the balance sheet was very disappointing, when all the circumstances were considered the results were not so bad as they appeared to be. About eight years ago a sum approximating £30,000 was spent upon plant for manufacturing pressed filament lamps, but that type of lamp was superseded by the drawn-wire filament, and this development necessitated the expenditure of a large additional sum of money upon new plant. Shortly afterwards there was a threat of litigation for alleged infringement of patents, which suspended the sale of lamps until an amicable arrangement was come to. There had recently been effected very large economies in expenditure with no loss of efficiency, and it was anticipated that the removal of the stores and clerical staff from the city to the works would also bring about a further reduction in expenditure.

**Royal Society of Arts.**—Among the papers to be read at the Royal Society of Arts Wednesday evening meetings during the session is "Applications of Electricity to Agriculture and Life," by T. Thorne Baker. Two juvenile lectures will be given on Wednesdays, Jan. 7th and 14th, at 5 p.m., by Mr. R. P. Howgrave-Graham on "Electric Vibrations and Wireless Telegraphy."

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published November 6th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**

20,849/12. **A.C. Commutator Motor.** B.T.-H.Co. (*A.E.G.*). The stator exciting and working windings and the rotor working winding are in series, but the first is also connected in parallel with a compensator (choking coil). A point in the winding of this is connected to a point in the winding of the supply transformer, so that the impedances of the rotor and stator circuits are equalised. Three figures.

23,669/12. **Synchronous Running of Motors.** W. E. LAKE (*Soc. Anon. du Temple, France*). The control is on the principle described in Patent 28,711/11, in which it is proposed to control a motor at a distance by placing it on the diagonal of a Wheatstone bridge. According to the present invention, two shafts, one at a transmitting and one at a receiving station, may be started and stopped simultaneously or driven at the same speed. The two shafts carry two commutator rings, and a commutator for putting the controlling resistances into circuit. The resistances of the commutators form part of a bridge, the diagonals of which comprise the dynamo field magnets, which are set in motion as soon as there is any angular displacement between the two shafts so as to vary the resistance couples and establish synchronism. Five figures.

24,043/12. **Relays for Wireless.** S. G. BROWN. One contact is made as a point of platinum, iridium, or osmium, &c., while the other is of carbon in a crystalline or disc form. The contact pressure is adjusted by a spring strip suspension, and, in addition, by small solenoids whose cores are continuations of the contact levers. The axis of the levers is as close as possible to the contact points, and the support is effected by a spring or knife edge. Five figures.

2,591/13. **Speed Control of Motor-cars, &c.** J. H. HOLMES. To prevent excessive speed, the sparking plugs are short-circuited by a centrifugal governor. At the same time, or earlier, warning signals are given to the driver. Five figures.

4,090/13. **Small Transformers.** VEDOVELLI, PRIESTLEY ET CIE. The carcass of the transformer carrying the two windings is surrounded with a removable mould, into which softened insulating material is forced by a powerful hydraulic press. Six figures.

12,710/13. **Protection of A.C. Motors.** G. ELLISON. Fuses are introduced in any two rotor circuits so that the rotor circuit is interrupted on a mechanical or electrical overload.

13,315/13. **A.C. Electro-Magnets.** OTIS ELEVATOR CO. (*Otis Elevator Ges., Germany*). The invention disclosed provides for the utilisation of residual magnetism to prevent the armature vibrating. The current coil is wound on a core having low residual magnetism. The armature is made of similar material, but the yoke is made of an iron having a high residual magnetism. The armature and core are provided with metal sheathings to act as dampers. Five figures.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** SIEMENS DYNAMO WORKS (*Siemens-Schuckert*), 12,575/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.-H.Co. (*G.E.Co., U.S.A.*) [Condensation products for impregnating solutions, &c.] 24,255/12; OLMSTED [Pressure regulation] 1,207/13.

**Dynamos, Motors, and Transformers:** FREEMAN [D.C.] 21,415/12; STAUNTON [Magneto] 28,469/12; SIEMENS DYNAMO WORKS (*Siemens-Schuckert*) 13,435/13; BROLT, LTD., BROOKS, and HOLT, 15,585/13.

**Electrometallurgy and Electrochemistry:** VON RECKLINGHAUSEN, HELBRONNER, and HENRI [Sterilising water] 24,625/12; PERREUR-LOYD [Electrolytic production of copper] 6,897/13.

**Heating and Cooking:** DUTERTRE and JACQUEL [Lamp radiator] 23,748/12; BERRY [Kettles] 23,861/12.

**Ignition:** KITCHELL [Timing] 13,241/13.

**Instruments and Meters:** BERRY [Indicating alteration in current in a circuit] 23,940/12; SAREL [Testing conductor resistance] 26,639/12; H. ARON ELEKTRICITÄTSZÄHLERFABRIK [Commutators] 16,753/13.

**Storage Batteries:** JOEL [Cases] 24,443/12; [Electrodes] 2,269/13.

**Switchgear, Fuses, and Fittings:** LAKE (*Gebr. Jaeger*) [Incandescent-lamp holders] 24,154/12; VASSBERG [Reversing switches for ratchet feeding gear] 24,550/12; RAILING and COLLINGS

[Lamp holders] 27,503/12; JACKSON [Tube couplings] 28,929/12; HUBBELL [Incandescent-lamp sockets] 3,656/13; GAMBRELL [Contact makers for resistance boxes, &c.] 4,862/13; DESPESSAILLES [Cut-outs with multiple safety fuses] 11,850/13; GOODWIN and VANDERVELL [Push-buttons for motor-car electric horns] 14,942/13.

**Telephony and Telegraphy:** BRUCE [Impulse transmitter] 24,409/12; GIRARDEAU [Alternators for wireless] 25,356/12; SIEMENS & HALSKE [Telegraph system unaffected by H.P. static discharges] 3,432/13; BALSILLIE [Wireless receivers] 15,674/13.

**Traction:** THOMAS and THOMAS TRANSMISSION [Power transmission] 24,618/12.

**Miscellaneous:** NEUBURGER [Pocket signalling lamp] 23,887/12; IRWIN [Electro-dynamometers] 27,343/12; HAWDON [Primary batteries] 27,351/12; KLAHN [Gyroscope for use with non-magnetic compass, &c.] 29,082/12; SPERRY [Gyroscopes] 2,294/13; CAHUITWERKE NÜRNBERG [Mine igniting machine] 14,870/13; DE LA RIBOISIÈRE [Automobile door sashes, &c.] 15,648/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Electrometallurgy and Electrochemistry:** JOHNSON [Reduction of zinc ores] 27,881/12; A.E.G. [Discharge tube with incandescent cathode and enclosed vapour-forming body] 22,816/13.

**Instruments and Meters:** SZILARD [Electrometers] 20,008/13.

**Switchgear:** A.E.G. [Live parts are immersed in oil or embedded in a fusible insulating material] 23,348/13.

**Telephony and Telegraphy:** ABRAHAM [Wireless telegraph receivers] 23,113/13; SIEMENS & HALSKE [Automatic selecting device for telephone systems] 23,336/13.

## Opposition Entered to Grant of Patents

18,654/12. **Winding Clocks.** C. H. DAVIES. The spring has one end free pressing against the internal wall of a spring drum, which is connected to the clock movement. It is wound up by a motor-driven worm wheel.

25,606/12. **Time Elements for Circuit-Breakers.** J. G. STATTER. Adjusting the distance between the sucker faces.

3,162/13. **Metal Filaments.** WESTINGHOUSE METALLFÄDEN GLÜHLAMPENFABRIK. Siemens Bros. are opposing the grant of this patent. See page 627 for fuller particulars.

## Grant of Patent Allowed

1,178/12. **Imitation Candles.** E. J. WILSON and the CANDO-LITE Co. The grant has been allowed in spite of the opposition.

## Amendment to Specification

14,653/12. **Sea-Water Temperature Annunciator.** A. McNAB. As a result of the extended investigation under Section 8 of the Act, a reference to Specification No. 9,695/13 has been inserted.

## Expiring and Expired Patents

The following Patent expires during the current week, after a *life of fourteen years*—

22,732 of November 14th, 1899. **Watertight Doors, Fire Shutters, &c.** H. H. LEIGH. (*F. J. Sprague, F. T. Bowles, and G. H. Hill, U.S.A.*) Watertight bulkhead doors for ships are operated by an electric motor whose shaft passes through the bulkhead. The motor-shaft may be worked manually from either side of the bulkhead. Remote control is provided.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** R. H. MARTIN [Slipping belt dynamo gear for train lighting] 16,590/06; C. M. GRAHAM [Insulator] 15,341/08.

**Incandescent Lamps:** B. T. H. Co. (*G. E. Co., U.S.A.*) [Production of thorium filaments] 14,972/05 and 14,972A/05.

**Switchgear, Fuses and Fittings:** B. T. H. Co., E. B. WEDMORE and W. P. HAMLYN [Reverse current circuit-breaker] 16,615/07; H. S. MARTIN [Adjustable resistance composed of flaky materials under adjustable pressure] 16,968/07.

**Telephony and Telegraphy:** W. P. THOMPSON (*Ges. für Drahtlose Telegr.*) [Wireless telegraphy for trains] 16,696/08; A. G. HELLYAR and JOHNSON SECRET WIRELESS TELEGRAPH and TELEPHONE TESTING SYNDICATE [Receivers] 16,747/06.

**Traction:** W. R. SYKES and C. J. COOKE [D.C. track circuit signalling] 15,590/08; C. P. STONE [Electro-magnetic railway carriage door lock controlled by axle-driven dynamo] 15,705/08; H. BUCKELL and A. R. MULLEY [Automatic railway signalling for single tracks] 15,868/08.

**Miscellaneous:** G. W. LUNDBERG and A. G. HOLMBERG [Magnetic separators] 16,675/07; E. C. R. MARKS (*W. N. McComb, U.S.A.*) [Illuminated sign using thermo-flashers] 15,469/08; B. E. D. KILBURN (*E. Oesterle, U.S.A.*) [Magnetic separators] 15,646/08; W. PATERSON [Thermostat for controlling temperature of superheated steam] 15,788/08; A. M. and J. M. AUBERT [Controlling gas valves] 15,861/08.

## PATENTS.

*Small Prepaid Advertisements with regard to Patents, &c., are inserted on this page, facing our Patent Record, at 1d. per word (minimum 5s.); three insertions for the price of two. Rates for displayed and card advertisements on application.*

*Advertisement matter, accompanied by a remittance, should be addressed to the Kilowatt Publishing Co., Ltd., 203 Temple Chambers, London, E.C.*

**RIGHTS OF PATENT** No. 27,090/12 offered for Sale. Patent refers to **REVERSE CURRENT CIRCUIT-BREAKER** for alternating current, avoiding potential coil, thus ensuring selective action. Particularly important application for absolute **SELECTIVE SECTIONALISING OF FAULTY CABLES** without need of pilot wires between terminals. Further explanation given upon inquiry.—**P. ACKERMAN**, 185 Carlton Street, Toronto, Ontario, Canada.

The Proprietor of the Patents Nos. 24,702 of 1908 and 24,708 of 1908 for "Improvements in and relating to **ELECTRIC FUSIBLE CUT OUTS**" and "Improvements in **SEAL FASTENINGS**," is desirous of entering into arrangements by way of license and otherwise on reasonable terms, for the purpose of exploiting the same and ensuring their full development and practical working in this country. All communications should be addressed in the first instance to:—**Haseltine, Lake & Co.**, Chartered Patent Agents and Consulting Engineers, 28, Southampton Buildings, Chancery Lane, London, W.C.

**CONTINUOUS CURRENT DYNAMO MACHINES**—The Proprietors of Patent No. 25,167/10 are desirous of working the above invention in Great Britain, and therefore invite communications with a view to the sale of the Patent or the granting of Licences to work the invention on reasonable terms. An illustrated description of the invention may be obtained from **BREWER & SON**, Patent Agents, 33 Chancery Lane, London, W.C.

**PATENTS**—The proprietor of British Patents Nos. 27,798 of 1910, 25,012 of 1910, 3,747 of 1911, and 4,397 of 1911, entitled Improvements in or relating to **COLLECTORS AND CONDUCTORS** for overhead conductor and railless **ELECTRIC TRACTION SYSTEMS**, desires to enter into arrangements by way of license or otherwise on reasonable terms for the purpose of developing and practically working the same in this country. Inquiries should be addressed to **W. P. THOMPSON & Co.**, Chartered Patent Agents, 285 High Holborn, London, W.C.

Improvements relating to **FLEXIBLE ELECTRICAL CONNECTION DEVICES**. No. 24,587 of 1907.

The Patentee is desirous of arranging by license or otherwise on reasonable terms for the manufacture and commercial development of the Invention in this Country. **HERBERT HADDAN & Co.**, Patent Agents, 31 and 32 Bedford Street, Strand, London, W.C.

## John E. Raworth,

Queen Anne's Chambers, Chartered Patent Agent.  
30, Broadway, Westminster, London, S.W.

### EVERY INSTALLATION ENGINEER

Should join his Trade Protection Organisation,

## ELECTRICAL ENGINEERING TRADE SECTION

## CATALOGUES, PAMPHLETS, &amp;c., RECEIVED

**TERMINAL BOXES.**—W. T. Henley's Telegraph Works Co., Ltd. (13 & 14 Blomfield Street, E.C.), have compiled an extremely interesting list of over 100 pages describing and illustrating their numerous types of terminal boxes for all classes of cable. The illustrations are excellent, and show perfectly the construction of the boxes, their dimensions, and the manner of using them. Almost every conceivable kind of box is included, and there are several new types. Prominent among these are sealing boxes for single cables up to 1,000 volts, right-angle terminal boxes for pressures up to 20,000 volts (which should prove particularly useful), outside terminal boxes in which the tails as well as the cable enter on the under side, and there are also some new designs of colliery cable terminal boxes and potheads for telephone cable. Several miscellaneous types designed from time to time for various customers are also illustrated. The mains engineer will find the list extremely useful.

**FITTINGS FOR OFFICE, STREET, AND SHOP LIGHTING.**—The new catalogue just issued by the Wardle Engineering Co., Ltd. (196 Deansgate, Manchester), should be in the hands of every electric light contractor. The company's lanterns for shop-front and street lighting are well known and largely used, and the catalogue shows the large number of different sizes and designs which are now obtainable. On the other hand, the "Inverlite" fitting, an effective but at the same time inexpensive and elegant fitting for semi-indirect lighting of offices, shops, &c., is a more recent addition to the firm's specialities, and we can safely predict for it an equal popularity. A feature of the catalogue is the excellent illustrations, which give a perfectly accurate representation of the actual fittings, including the new "Inverlite" pattern and a cheap and useful model bearing the name "Vestelite," designed for entrance halls, shop interiors, &c.

**HEATERS AND RADIATORS.**—Several new patterns are included in the new season's heating catalogue recently issued by the Edison and Swan United Electric Light Co., Ltd. (Ponders' End, Middlesex). The list embraces numbers of radiators of the luminous heat type, many convectors and radio-convectors on the Dowsing-Huntley system, and quartzalite glowing heaters made under Bastian patents.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**ELECTRIC HEATERS.**—The Bastian Electric Heating Syndicate, Ltd. (185 Wardour Street, W.), have sent us a copy of a post-card which they are preparing for circulation throughout the trade reproducing an effective picture of a little girl making toast at a glowing radiator. This is also the subject of a showcard, 18 ins. by 14 ins., which they are prepared to send to contractors and others interested.

**ASBESTOS WOVEN NET RESISTANCES.**—A leaflet from the Schniewindt Electric Co. (40 and 41 Staniforth Street, Birmingham) draws attention to the woven net resistances made by this firm for resistance work of every description. In inviting inquiries, the company offers to send samples of its work on application.

**HEATING AND COOKING APPARATUS.**—Another leaflet by the above firm gives prices of a complete range of "Triumph" electrically-heated, polished aluminium water boilers and stewing pots. The former range embraces sizes from  $\frac{1}{2}$  pint to 4 pints' capacity, and the latter from 1 pint to 10 pints.

**PIPE-CUTTING PLIERS.**—A useful appliance for contractors, wiremen, fitters, and others, sold by the Schniewindt Company, is a light pair of pipe-cutting pliers. An easily replaceable protected cutting wheel is used.

**WATER METERS.**—An illustrated pamphlet from Siemens Brothers & Co., Ltd. (Woolwich), gives particulars of a new modification of the Siemens disc type water meter, which is specially suitable for the measurement of boiler feed water. Owing to the use of specially made graphite carbon for the rubbing and sliding parts, further lubrication of the moving parts, even with the highest temperatures, is unnecessary. We are requested to state that all inquiries for this apparatus should be addressed to the Electric Appliances Department (Caxton House, Westminster, S.W.).

**METAL FILAMENT LAMPS.**—Among the most recent advertising matter produced by the Edison and Swan United Electric Light Co., Ltd. (Ponders' End, Middlesex), is an ingenious coloured folding card price-list, on the outside of which is de-

picted a country house illuminated with Royal Ediswan drawn-wire lamps. On opening the card a representation of the Ponders' End factory is seen, and a large Ediswan metal filament lamp comes up through the roof of the central building. Another interesting card is a picture postcard of the refacing of Buckingham Palace by the aid of Ediswan metal filament lamps.

**FITTINGS.**—A new section list, covering "three Benjamin Trouble Savers," has been issued by the Benjamin Electric, Ltd. (117 Victoria Street, S.W.). Included are the "Bengrip" adaptor and "Benco" lampholders (described and illustrated in ELECTRICAL ENGINEERING, Oct. 2nd, p. 554), and the Benjamin "Wireless" adaptors, which are complete with all internal connections. These well-known specialities have been referred to in our columns on several occasions.

**TECHNICAL BOOKS.**—We have received the October number of the quarterly list of new books and new editions added to Messrs. H. K. Lewis's Medical and Scientific Circulating Library (136 Gower Street, W.C.). Several engineering and electrical books are included, as well as many other branches of science and technics. Short notes are given on the most important works, and the list should be useful to those wishing to see what has appeared during the last few months on any subject that they are interested in.

**MECHANICAL STOKERS AND FORCED DRAUGHT.**—Catalogues from Meldrums, Ltd. (Timperley, near Manchester), deal with the "Meldrum" improved forced draught furnace from the points of view of fuel economy, increased boiler steaming, and smoke prevention. Other lists deal with the "Koker" and "Sprinkler" types of mechanical stokers for forced, induced, or natural draught working, according to the quality of the coal, local conditions, &c.

**INSULATING MATERIAL.**—A folder is to hand from Carson and Evans (3 Fenchurch Buildings, E.C.) quoting some actual opinions of users regarding the insulating material named "Carvanite," which this firm introduced not long ago. Its mechanical properties are said to be better than those of ebonite and vulcanite, and its insulating properties quite as good.

**THE UNITED STATES NEW TARIFF.**—A pamphlet giving the United States duty rate on every article mentioned in the old United States Customs tariff, and comparing this in a parallel column with the duty under the current tariff, has been issued by R. F. Downing & Co. (17 and 18 Garlick Hill, E.C.), who will send a copy to interested persons who apply in writing.

**CORRESPONDENCE INSTRUCTION.**—We have received a series of pamphlets outlining the methods adopted by the Engineer Specialists' Institute which has recently been established at 12 to 14 Red Lion Court, Fleet Street, to carry on correspondence instruction in electrical engineering and other subjects.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Aldershot.**—350 yards three-core, paper-insulated cable. Borough Electrical Engineer. November 18th.

**Ballater.**—The Council has now decided to give Messrs. T. C. Smith & Co. facilities in connection with their proposed electric lighting scheme, and also to place street lighting in their hands. A local company is to be formed to carry out the scheme.

**Braintree.**—A report has been received from a consulting engineer with regard to an electric supply scheme.

**Bristol.**—A proposal to extend the supply mains to Warminster has been acceded to by that Council.

**Dawlish.**—The Dawlish Electric Light & Power Co. has decided to make considerable extensions to its generating plant, and also to the distributing system.

**Elland.**—A Local Government Board inquiry was held last week concerning a loan of £1,000 for electrical extensions.

**Holmfirth.**—An application has been made to the Local Government Board for a loan in connection with the electric supply scheme.

**Ilkley.**—A loan of £18,000 for plant extensions is to be applied for.

**Lurgan.**—The £12,000 scheme, referred to in our last issue, has been provisionally adopted by the Council.

**Lytham.**—The Council obtained an electric lighting order as long as ten years ago. This was, however, revoked.

but a new one subsequently granted, and it has been decided to proceed with the scheme.

**Rangoon.**—The Rangoon Electric Tramway & Supply Co. is issuing new capital in order to extend its plant.

**South Africa.**—According to the *British & South African Export Gazette*, the Prince Albert Council will shortly be in the market for a £10,000 electrical plant.

**Southampton.**—Steam turbo-alternator. Borough Electrical Engineer. (See advertisement on another page.)

**Wiltshire.**—According to the *Morning Post*, the Postmaster-General proposes to erect an electric power station on the Beckhampton Downs, near Devizes.

**Wolverhampton.**—One 1,000-kw. rotary-converter set. Borough Electrical Engineer. November 24th.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Belfast.**—Art Gallery. Town Clerk.

**Doncaster.**—Cinematograph theatre, High Street.

**Finchley.**—New fire station.

**Leigh (Lancs.).**—Additions to technical school. Town Clerk.

**London.**—Club house (£15,000) in Dean Street, Soho. Union of Hotel, Club and Restaurant Workers.

**L.C.C.**—240 points at the Lancaster Road elementary school, Notting Hill. (See advertisement on another page.)

**Wandsworth.**—New swimming bath, Elmfield Road, Balham.

**Middlesbrough.**—Additions to Broomlands Hospital. Architects, R. Lofthouse & Sons, 129 Albert Road.

**Perth.**—New Academy.

**Rainhill.**—Electric wiring and fittings for new ward at County Asylum. Clerk.

**Sale.**—New municipal offices (£10,000).

**Sheffield.**—Sanatorium (£37,000).

**Stalybridge.**—Public baths.

**Swansea.**—Electrical installation at new club, Alexandra Road. Consulting Engineer, H. K. Benson, Metal Exchange.

**Wigan.**—Alterations and additions to Pemberton Hospital. Borough Electrical Engineer.

### Miscellaneous

**Antwerp.**—Two electric passenger lifts at the Industrial School. Further particulars, 73 Basinghall Street.

**Australia.**—Track feed boxes, track resistances, impedance bonds, track relay and relay boxes for Melbourne Suburban Railways. Consulting Engineers, Messrs. Merz & McLellan, 32 Victoria Street, S.W. (See advertisement on another page.)

**London: G.P.O.**—The Postmaster-General has indicated that he is prepared to consider applications from companies willing to tender for the construction of three high-power wireless stations forming part of the Imperial wireless chain.

Tenderers must be in the position of demonstrating the efficiency of their systems for continuous communication by day and night over a distance of not less than 2,000 miles. Communications should be made with the Secretary of the Post Office before November 21st, stating the earliest date on which a demonstration can be given.

**Montevideo.**—The capital of the United Electric Tramways of Montevideo is being increased in order to equip two sub-stations and to carry out other works.

**North Eastern Railway Co.**—Twelve months' supply of electric lamps, wires, cables, fittings, and arc-lamp carbons.

**Russia.**—The Central Administration of Posts and Telegraphs recommends the installation of a large number of wireless telegraph stations in their programme for 1914.

**Electric Cooking at Wimbledon.**—Great credit is due to Mr. H. Tomlinson Lee, the Borough Electrical Engineer, for the excellent organisation of the Electrical Exhibition which took place last week in premises on the main road, which were temporarily converted into a lecture-hall and show-room adjoining. In the former, in conjunction with Messrs. Gillespie & Beales, of Amberley House, Norfolk Street, Strand, W.C., a series of cooking lectures and demonstrations with "Tricity" cookers was given by Mr. F. S. Grogan, of the British Electric Transformer Co., Ltd., who delighted his audiences with all they saw and heard. These lectures, owing to the excellent local publicity, were crowded to overflow on the first day, and it is estimated that during the week nearly three thousand people attended, or about one-twentieth of the population. In the show-room adjoining, with the co-operation of the local contractors, a fine display was made, and a large business resulted in cookers and radiators.

## TENDERS RECEIVED AND ACCEPTED

**Ipswich.**—A contract has been placed with Messrs. Chamberlain & Hookham for meters of 10 amperes and upwards.

**Metropolitan Railway Co.**—A contract has been placed with the Edison & Swan United Electric Light Co. for a twelve months' supply of incandescent lamps.

**Manchester.**—The following tenders have been accepted:—Electric lighting of Municipal School of Domestic Economy, W. P. Theermann & Co.; cable, Johnson & Phillips; H.T. switchgear, Ferranti, Ltd.; lamps, British Thomson-Houston Co., Brush Electrical Engineering Co., and Siemens Bros. Dynamo Works.

**South Africa.**—We understand that the East Land Proprietary Mines have placed an order with a Paisley firm for an electric winding plant, capable of winding eight tons of ore from a depth of 4,500 feet at a speed of 3,000 feet per minute. The "Ward-Leonard" system will be fitted.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpott Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night was £73 to £73 10s. (last week, £76 to £76 10s.).

**Partnership Dissolved.**—The partnership between A. Evans and E. G. Todd (Clive & Co.), electrical engineers, of Sutton Coldfield, has been dissolved.

**Bankruptcies.**—The last date for receiving proofs in the bankruptcy of J. W. Garsden, Electrical Engineer, 5 Hope Terrace, Dukes Brow, Blackburn, is November 22nd.

**Liquidations.**—Ozonair, Ltd., is to be wound up voluntarily. Mr. T. S. Wederell, Balfour House, Finsbury Pavement, E.C., is liquidator.

## NEW COMPANIES

**ELECTRIC LIGHTING AND ENGINEERING CO.**—Capital, £3,000. To take over a business carried on by J. O. Rhodes with the above title at 145 Duke Street, Liverpool.

**FULLER ACCUMULATOR CO.**—Registered by Tarry, Sherlock & King, 17 Serjeants' Inn, E.C. Capital, £65,000. Electrical and general engineers. To establish agreements with G. Fuller, G. J. A. Fuller, and L. Fuller, and with J. C. Fuller & Son, Ltd.

## What the Public Wants

Booklets describing in simple language the various applications of electricity.

Part I. "Electric Lighting" (Price 1d., by post 2d.).

Part II. "Electric Cooking and Heating, and other Domestic Uses of Electricity" (Price 2d., by post 3d.).

Part III. "Works Driving" (Price 2d., by post 3d.).

Prices for quantities on application to the  
**KILOWATT PUBLISHING CO., LTD.,**  
TEMPLE CHAMBERS, LONDON, E.C.

## AN ELECTRIC KITCHEN AT BRIGHTON

WE reproduce here a photograph (kindly sent us by Mr. J. Christie, Engineer and Manager, Brighton Corporation Electricity Dept.) of the electric kitchen which has recently been equipped at the Old Ship Hotel, King's Road, Brighton, as a part of a general renovation and re-furnishing.

This equipment consists of the following items:—One range of four ovens, each measuring inside 24 in. by 20½ in. by 20½ in., with hot cupboards separately heated above the ovens; each oven has a consumption of 5 kw., and the hot cupboards approximately 2 kw. each. One grill, 36 in. by 12 in., with a hot cupboard above, the grill taking 7 kw., and the hot cupboard above 1 kw. The fish fryer consists of two oval pans measuring 18 in. by 12 in. each fitted with a draining rack, and having a maximum consumption 2½ kw. One hot-plate for boiling purposes, 4 ft. by 2 ft. 2 in., containing four 12-in. boiling rings, each with a consumption of 2.5 kw. Two large vegetable steamers with consumption of 10 kw. The kitchen is entirely new, having been built specially for electric cooking. The work has been carried out under the direction of the Corporation Electricity Department, and Messrs. Page & Miles, of 60 Western Road, Brighton, supplied and fitted the apparatus, which was manufactured by the Jackson Electric Stove Co., Ltd., 38 Blandford Street, Baker Street, London, W.

The equipment is now doing the whole of the work of the hotel, including banquets, and has been in daily use for

flame-proof covers, and it is only continuous-current machines that call for special treatment. In those situations where motors must be protected from the atmosphere, two alternatives present themselves—(a) total enclosure, and (b) pipe-ventilation. Total enclosure is a very costly form of pro-

FIG. 1.—60-H.P. THREE-PHASE SQUIRREL-CAGE PIPE-VENTILATED MOTOR.

tection and cannot be applied to large motors of reasonable dimensions. Pipe ventilation is the cheaper alternative for small motors, and the only solution for large ones. In the past, trouble has been experienced with some designs of pipe-ventilated motors on account of the fact that a lower pressure exists inside the motor than outside, and in consequence oil has been sucked from the bearings into the

ELECTRIC KITCHEN AT THE OLD SHIP HOTEL, BRIGHTON.

some weeks, and the results obtained, both as regards quality of the food cooked, simplicity of operation, and low cost of working with electricity at 1d. per unit, already surpass the claims which were made by the Electricity Department when the question was discussed by the Directors. Mr. Hindle (the manager of the hotel) and his board are to be congratulated on their pluck and enterprise in fitting up their new kitchen on such an elaborate scale and there is little doubt but that their confidence in this new method of cooking will be amply repaid by the satisfaction of their patrons.

## PIPE-VENTILATED MOTORS

ELECTRIC motors are frequently called upon to work in situations where the surrounding atmosphere is far from favourable to the insulation, to the commutation, and to the brush gear, or where it is imperative that they should be protected from explosive gas or dust. Moisture is the chief source of danger to the insulation in many industries, such as laundries, paper mills, and dye works. In others a fine dust has to be eliminated from the air ventilating the heating parts of the motor. A typical example, for instance, of this class of industry lies in a cement works, where the dust is held so finely in suspension in the atmosphere that no practical filter can remove it, and it would "sand-blast" the windings to destruction in a very short time. Explosive dust is often encountered in collieries, washeries, and screening plants, and in flour mills. In these latter cases, however, where the motor must needs be specially enclosed to prevent explosion, induction motors are exempt from special measures, except that the slip-rings need to be enclosed in

interior of the machines. In a new line of pipe-ventilated motors which has been designed by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), special attention has been paid to this point. The motors have been designed specially for pipe-ventilated work, and represent the latest

FIG. 2.—250 H.P., THREE-PHASE SLIP RING PIPE-VENTILATED MOTOR.

practice in this direction. Considerable interest attaches to the construction of the bearings of these motors. To avoid the suction of oil, which has been previously mentioned, the bearing is completely separate from the casing, a special bracket being provided. A clear space of air surrounds the shaft where it enters the bearing, so that no suction of oil can possibly take place. The slip-rings of motors with wound rotors are specially designed to exclude dust, great care being exercised at those points where the short-circuiting bar passes

through the slip-ring cover in order to make the protection against dust thoroughly effective. The success which has attended the design of these motors is evidenced by the fact that one firm of cement makers has placed two successive repeat orders for the complete electrification of cement works after the first mill had been in operation for a considerable period. To this one firm alone over 7,000 h.p. of pipe-ventilated motors, together with dust-tight liquid starters and other gear, has been supplied by the General Electric Co.

### FIELD SWITCHES

THE accompanying illustration shows a new pattern of field switch, which A. Reyrolle & Co., Ltd., are fitting to power station generator panels. The switch is of a double-pole type fitted with contacts for a discharge resistance. As will be seen, it is made in the form of a drum controller with a dust-proof cover. The electromagnetic device at the bottom end of the drum is so arranged as to interlock the field switch with the main switch. With this arrangement it is impossible to open the field switch unless the main

AUTOMATIC FIELD SWITCH WITH COVER REMOVED.

switch is also open. Moreover, the field switch will trip out automatically in the event of the main switch operating. The latter operation is important, as generators are now often fitted with Merz-Price protection, which automatically trips out the main switches in the event of a fault occurring in the winding, thus isolating the faulty generator from the busbars, but it is necessary also to open the field circuit automatically in order to reduce the damage to the machine. For this purpose the field switch is made to trip out automatically immediately after the main switch.

### UNIVERSAL VOLTAGE SUPPLIES

THE Supply Department of the British Westinghouse Electric & Manufacturing Co. (14 Long Milgate, Manchester, and 179 Wardour Street, London, W.) are introducing some useful and interesting electric irons, kettles, coffee-jugs, and other similar heating apparatus which are suitable for any standard voltage between 100 and 250 volts. Three

3 LB. IRON FOR TRAVELLERS.

NICKEL-PLATE WATER HEATER.

terminals are provided which can thus be used as pairs in three different ways and take pressures of about 110, 220 or 150 volts. Some designs, two of which are illustrated here, are particularly adapted for the use of travellers, and they are provided both with an ordinary plug and a lampholder adapter, so that current may be taken from anywhere. The iron illustrated is a 3 lb. iron and goes, together with the plug, adapter and flex, into a neat leather travelling case,

and the water heater is also a compact little piece of apparatus, and inexpensive although it is well finished. The two models shown are fitted with wicker handles, are heavily nickel-plated, and altogether present an extremely elegant appearance.

### SEMI-INDIRECT LIGHTING

AS may be seen by the illustrations, Figs. 1 and 2, here given, the semi-indirect lighting fitting, known as the "Saturn," just put on the market by the Electrical Engineering & Equipment Co., Ltd. (109-111 New Oxford Street, W.), has a number of good points. The bowl and reflector are both fitted with the company's automatic raising and lowering

FIG. 1.—"SATURN" SEMI-INDIRECT LIGHTING FITTING IN USE.

FIG. 2.—"SATURN" SEMI-INDIRECT LIGHTING FITTING LOWERED FOR CLEANING.

gear, similar to that used in its arc lamp contact gears, so that cleaning is facilitated. The possibility of lowering the reflector on the centre stem also makes the erection of the fitting very simple. As the centre stem does not pass through the bottom of the bowl, no black spot immediately under the fitting is produced.

### A NEW CIRCUIT-BREAKER

AFTER numerous experiments, a new design of loose-handle circuit-breaker has been evolved by Switchgear & Cowans, Ltd. (Springfield Lane, Salford). It is known as the "Watchman," and is built entirely on the metal mica prin-

"WATCHMAN" ENCLOSED CIRCUIT-BREAKER

ciple, and enclosed in a strong cast-iron case, which may be sealed. Bow-shaped laminated copper brushes, renewable auxiliary contacts, and carbon breaks are provided. If instantaneous action is not desired, then by the application of Statler's Patent Timelag an adjustable time element may be provided. These breakers are stocked in two sizes, 30 amperes and 150 amperes, drilled for 7/8 in. conduit, and ready for immediate delivery.

## SHOP WINDOW LIGHTING

IN order that the illumination on the displayed goods should bring out their qualities and attract the attention of passers-by to the fullest extent, it is advisable that shop windows should be lighted in a similar way as is the stage of a theatre. Exposed lamps should not be used there except when they

WINDOW IN NORWICH LIGHTED WITH THE AID OF PRISMATIC GLASS REFLECTORS.

form an essential part of a particular scene, and their use in such cases serves to remind one of the greater comfort and restfulness of concealed light sources. Window lighting, to be effective in the highest degree, should be accomplished by means of lamps so placed that their direct rays cannot shine into the eyes of the observer while he is looking in the window. In this way emphasis is placed upon the goods displayed, and not upon the lamps which light them, because these are concealed. A successful method of window lighting along these lines is that designed by the British Thomson-Houston Co. (77 Upper Thames Street, E.C.). In this system Mazda electric lamps are fixed in a single row along the front edge of the window where the ceiling and plate-glass meet. Reflectors are, of course, necessary to project the light downward and back into the window. X-ray silvered glass or Holophane prismatic glass reflectors are generally used for this purpose. A recent window lighting installation on this system is that of Messrs. Chamberlins (drapers), of Norwich, illustrated here. The units employed here consist of Mazda lamps in prismatic glass reflectors fixed along the top front edge of the window, and concealed by means of a narrow curtain running the whole length of the window.

## AN ELECTRIC CLOCK INSTALLATION

THE London Hospital used to be provided with no less than 192 eight-day clocks of every variety, but considerable difficulty was experienced in keeping these all accurately in time together, hence the decision to equip the Institution with the "Synchronome" system of electrical time service.

In this system the dials are merely clock faces, the ordinary works being dispensed with in favour of one wheel and an electro-magnet, by means of which the hands of all of them are advanced one half-minute at a time in perfect synchronism. The controlling pendulum or electrical time transmitter which operates them is entirely automatic in its action, and is synchronised every hour from Greenwich. It sends out electrical impulses every half-minute to the dials, upwards of 200 of which have been fixed in the great Hospital buildings, the Medical College, Nurses' Homes, &c. The occasion of starting this time service was marked by a little ceremony of inauguration on November 3rd, when the Governors of the Hospital gathered round the controlling pendulum in the telephone exchange room at the entrance hall to see the first time signal arrive at 4 p.m., and to hear Mr. F. Hope-Jones, the inventor of the system, briefly describe the installation. On the completion of the installation the clocks throughout the Institution had been set to 4 o'clock, and the pendulum was held to one side by means of an electro-magnet controlled from Greenwich Observatory. Precisely at 4 o'clock the pendulum was released and sent out its first impulse

to the 200 dials, advancing them half a minute. Theoretically the installation should continue to go for all time, untouched by human hands except for the charging of the battery for half an hour once a month. Many precautions are taken to prevent accidents, and even the possibility of severance of the line wire during building alterations has been provided against by means of a device designed by Mr. H. Tuffrey, the Contractors' Manager, which, upon a disconnection or other irregularity in the line, immediately cuts the faulty section out of the circuit without the loss of a single half-minute impulse. The method of synchronisation is worthy of mention. According to whether the minute hand is before the sixtieth minute or on or after it, so the Greenwich signal is directed through one of two electro-magnets whose functions are to put a small weight on a tray on the pendulum rod if the clock is slow, or take it off if fast. The work has been carried out in its entirety by The Synchronome Co., Ltd., of 32 and 34 Clerkenwell Road, under the supervision of Mr. Oatley, Surveyor of the Hospital, who has introduced into this installation a special waterproof type of dial for the wards, inserted in the walls.

## A MAZDA SIGN

ONE of the most brilliantly effective efforts in the direction of electric signs which are now so popular in theatre-land is the exterior lighting of The Alhambra. About 1,800 20-watt 100-volt Mazda lamps are employed for this purpose. The installation on the Leicester Square frontage consists of two signs, one flat and one projecting, advertising the "Keep Smiling" Revue. Above these is the word "Alhambra," in glaring letters about 86 in. high. The windows on either side of the entrance are outlined with Mazda lamps. There are also some smaller signs on the other side of the building. Mazda lamps are also used inside The Alhambra. The lamps were supplied, and the installation was designed, by the British Thomson-Houston Co., Ltd., but a great deal of

MAZDA SIGN AT THE ALHAMBRA.

credit for the effectiveness and excellent workmanship of the central projecting sign is due to Electric Installations, Ltd., who changed the wording from "8d. a Mile" to "Keep Smiling."

**Benjamin Steel Reflectors.**—The Benjamin Electric, Ltd. (117 Victoria Street, S.W.), announce that after considerable experimental work they have developed a special interior surface which will in future be applied to all Benjamin steel reflectors. This surface is obtained by a transparent coating which forms a simple protective surface over the aluminium reflecting medium, which allows all reflectors so treated to be cleaned very easily, and this surface will be referred to as the "Ezekleen" reflecting surface. The ordinary aluminium surface shows depreciation in efficiency after a short service, due to the dirt particles, which it is impossible to remove as they go into the pores of the aluminium, but with the "Ezekleen" reflecting surface this disadvantage is overcome. This adds further to their extreme usefulness for factory and all industrial lighting, as it increases their utility and efficiency at no extra cost to the consumer.

## THE GLASGOW ELECTRICAL EXHIBITION

WE are now able to illustrate the well-arranged Siemens stand, already described in our columns, and to give a few notes on stands not mentioned in our first and second notices.

The British Westinghouse Electric & Manufacturing Co., Ltd., have a comprehensive selection of lamps and cooking and heating apparatus. A Westinghouse horizontal gas engine is shown direct coupled to a continuous-current generator, and a novelty is the "Dim-a-Lite" attachment for use in conjunction with incandescent lamps. The Western Electric Co., Ltd., show specimens of electric lighting, power, and telephone cables, with suitable joint-boxes and requisites for aerial and underground systems. A specimen of an 800-pair telephone cable is splayed out in the form of a tree, and the latest types of telephones are shown, including mining instruments conforming with the

Home Office requirements. At the stand of Electric Control, Ltd., are to be seen in operation several types of automatic controllers, including push-button and car-switch types of lift controllers, also controllers for automatically starting and stopping air compressors, hydraulic pumps, &c. There is also a complete arrangement of automatic gear in connection with a plate-edge planer as installed in shipyards and steel mills. Thomas Keesnor & Co. show an elevator controller for use with car-switch and push-button lifts, also a small service controller for use with service lifts. A special feature is the new automatic motor starter with single-pole main switch. The strong qualities of the Mazda lamps are demonstrated at the stand of Fraser & Borthwick by means of a motor-driven vibrating machine. The exhibit of McNaughten & Watson includes a collection of bakery machines, including whisk and dough-mixing machines driven by electric motors. Another item is the electrically-driven "Perfect" dairy cream separator. There are also on view a band sawing machine, meat-cutting machinery, drills, and fans, all electrically driven.

## THE EDISWAN SCREW-CAP LAMP

THE Edison & Swan United Electric Light Co., Ltd., have recently introduced a miniature form of drawn-wire metal filament lamp in cone-shaped bulb for voltages from 100 to 125, in sizes from 10 to 40 watts. This is a lamp in large demand abroad, having a bulb of small dimensions, only 4 in. overall length and 1½ in. diameter; consequently a much larger number can be shipped per standard case. For this reason this lamp has been much sought after by exporters, because it effects a saving in freight.

## ALBA GLASS

ALBA, as most of our readers know, is a white, translucent glass of special composition. It is used in the form of reflecting bowls for semi-indirect lighting, and in the form of balls and globes for direct lighting. Apart from its very beautiful appearance, the chief characteristics of Alba glass are its high reflecting efficiency, low absorption, and excellent diffusion.

A brief *résumé* of the chief points of difference between Alba and the many other kinds of white glassware which are still in use will be of interest. It was realised some years ago that, of the various kinds of glass globes and reflectors in use, none was entirely satisfactory. Most absorbed too much light; many possessed the serious demerit of "selective absorption," that is, they did not absorb to an equal extent the various rays radiated by the light source. Another defect was imperfect light diffusion. These criticisms apply to the numerous opal, alabaster, and opalescent glasses still on the market. Opal glass is a milk-white glass consisting of a single layer. It absorbs a great deal of light, and owing to its selective absorption takes on a slight, but very undesirable, reddish tint. Alabaster glass usually consists of a layer of clear glass with a thin layer of opal glass inside. This is sometimes called poly-case glass. It does not absorb so much light as ordinary opal glass, but gives a more pronounced reddish tint to the light, for the simple reason that it is not so dense as opal glass, and the light source is more easily seen. Opalescent glass is a single layer of glass somewhat similar to alabaster in appearance, but less dense, so that the colour effects are even worse. The manufacturers of Alba set themselves the task of producing a glass which should have none of the defects mentioned above. After considerable investigation and experiment they were successful, and the result is Alba. Alba glass is sufficiently dense to screen the light source completely; it absorbs only a negligible amount of light, and that not selectively; and it diffuses the light perfectly, so that the whole surface is uniformly brilliant. The result is produced by numerous small particles held in suspension in the glass. These suspended particles break up the light rays and give a high degree of diffusion with the minimum of absorption. In Alba bowls and globes for interior lighting, the glass is pressed into form, and the suspended particles are concentrated,

giving the glass a denser appearance than is the case with the Alba street-lighting balls, which are blown. The latter are extensively used throughout the United States and Canada for ornamental street lighting, and several installations have recently been made in London.

We have just received from The British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), a copy of a new folder (No. 82336) which describes, illustrates and prices various forms and sizes of Alba glassware. This folder is particularly well illustrated and gives an excellent idea of the beauty of the various designs of Alba bowls, spheres and globes. All who are interested in illumination should make a point of writing for a copy of this folder (contractors can have quantities overprinted with their name and address), or, better still, visiting the Company's new showroom at Mazda House and personally inspecting samples of what undoubtedly represents one of the greatest recent developments in lighting glassware.

## SUMMARY

A BRADFORD weaving shed, in which a crossshaft system of group driving is employed, and electricity used for lighting, cooking, ventilating fans, &c., is in successful operation. (Page 645.)

A RECENT paper by Messrs. I. Langmuir and J. A. Orange, read in America, discusses the nitrogen-filled half-watt incandescent lamp from several points of view. (Page 646.)

MR. DUDELL's address to the Institution of Electrical Engineers on Thursday last, on pressure rises, dealt with a subject that synchronises with some notes which we publish on special precautions recently adopted on the Brighton supply system for prevention of damage due to this cause. Mr. Duddell dealt with surges due to resonance switching and arcs, and said that oil switches used for breaking very small currents sometimes arc, though they do not do so with large currents. Mr. Duddell also hinted at the possibility of the presence of hydro-carbon vapours facilitating arcing in cable breakdowns. (Page 647.)

MR. D. H. OGLEY writes regarding the effect of variations of voltage on metal filament lamps. (Page 648.)

A PAPER by Dr. A. Lederer contains illustrations showing the different crystallising effect of alternating and continuous currents on tungsten filaments. (Page 648.)

A TWO-RATE tariff system, in which an automatic switch actuated by the magnitude of the load is em-

ployed, instead of a time-switch, was suggested by Mr. H. H. Perry at a meeting of the Institution of Electrical Engineers at Birmingham. (Page 649.)

A REPORT on electricity undertakings in Germany, in which companies and Local Authorities are jointly interested, is reviewed on page 649.

DURING the week a patent dealing with the Moore tube system of lighting will expire after a full life. Opposition has been entered to the grant of a patent to J. Close for visual mine-shaft signals. Among the specifications published by the Patent Office last week is one by J. G. Balsillie, and one by E. Girardeau dealing with wireless, and one by J. T. Irwin describing an astatic electro-dynamometer. (Page 650.)

POSSIBLE causes of irregularities in the working of an electric lift are discussed in our Questions and Answers Columns. (Page 651.)

OFFICIALS from the Victorian Government Railways will shortly be in London inspecting electric railway systems.—An estimate has been prepared of the cost if the Stirling Corporation purchases and works the local tramway system, instead of the recent offer by a private company being accepted.—The Greenock Corporation is against a suggestion to purchase the local tramways. (Page 652.)

THE Post Office has decided to erect ten additional automatic telephone exchanges in different parts of the country.—Application is being made for prolongation of the "telewriter" patent.—The formula for the radiation decrement of aerials for wireless telegraphy was developed by Mr. J. Pletts in a recent lecture. Among the other matters dealt with was the variation in signals with atmospheric conditions, which subject has been experimentally investigated by Herr Mosler, who finds that the variations noticed may be put down to periodic fluctuations in the conductivity and reflective properties of the upper ionised air strata. (Page 652.)

A LARGE order for cables for the electric traction scheme on the London and South-Western Railway has been executed by Siemens Brothers & Co. (Page 653.)

A REDUCTION gear of very large ratio is described and illustrations are given of novelties in decorative and indirect lighting on page 654.

RUBBER-SHEATHED cables, telephone instruments, crane magnets, and incandescent lamp advertisements, form the subjects of articles on page 656.

EXPENDITURE upon plant and mains is contemplated as follows:—Hereford (£1,000); Basingstoke (£14,000); Wolverhampton (£22,000); Radcliffe (£3,950); Hackney (£56,748); Wallasey (£65,000); Loughborough (£14,000); Bradford (£90,000).—A power station is required by a Cornwall Clay Company; transformers and converting plant at Shoreditch; motors and motor-starters at Birkenhead; an electric pumping plant in New Zealand; H.T. switch panels at Plymouth. (Page 657.)

THE Sunderland Corporation are reducing the charge for heating and cooking from  $\frac{3}{4}$ d. to  $\frac{1}{4}$ d. where the premises are electrically lighted.—The income of the Leeds Electricity Department for the past half-year was 19 per cent. in advance of the corresponding period of last year.—The Weston-super-Mare Council has decided upon a certain amount of public electric lighting in preference to gas.—It is estimated that the Hove Corporation will have to pay £175,000 for the local electric lighting undertaking.—The Lytham Council has decided to promote an electric lighting scheme of its own in preference to taking current from the St. Annes electricity works.—Professor W. M. Thornton has reported on behalf of the Hebburn Council with respect to the recent failures on the 240-volt continuous-current cables into which the Board of Trade is now inquiring. (Page 658.)

### ARRANGEMENTS FOR THE WEEK

FRIDAY, NOVEMBER 21st.

*Institution of Electrical Engineers: Newcastle Section.*

7 p.m. At Hugh Bell School, Middlesbrough. "Steam Boiler Working in Electrical Power Stations," by J. W. Jackson.

TUESDAY, NOVEMBER 25th.

*Institution of Electrical Engineers: Manchester Students' Section.*

7.30 p.m. At Municipal School of Technology. Address by Prof. W. E. Marchant.

WEDNESDAY, NOVEMBER 26th.

*Institution of Electrical Engineers: Birmingham Section.*

7.30 p.m. At University. "The Characteristics of Insulation Resistance," by S. Evershed.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. At Victoria Embankment. Address by Dr. C. V. Drysdale.

*Institution of Civil Engineers: Students' Section.*

Visit to Metropolitan Railway Power Station, Neasden.

THURSDAY, NOVEMBER 27th.

*Institution of Electrical Engineers.*

8 p.m. "The Characteristics of Insulation Resistance," by S. Evershed.

FRIDAY, NOVEMBER 28th.

*Physical Society.*

5 p.m. At Imperial College of Science, S. Kensington. The agenda includes the exhibition of a Double-Fibre String Galvanometer," by W. Apthorpe.

### The London Electrical Engineers.

(To-day) THURSDAY, NOVEMBER 20th.—*C. Company.* Technical Instruction, 7 to 10 p.m.

FRIDAY, NOVEMBER 21st.—*D. Company.* Technical Instruction, 7.30 to 10 p.m.

SATURDAY, NOVEMBER 22nd.—*Headquarters* open from 10 a.m. till noon.

MONDAY, NOVEMBER 24th.—*A. Company.* Technical Instruction, 7 to 10 p.m.

TUESDAY, NOVEMBER 25th.—*B. Company.* Technical Instruction, 7 to 10 p.m.

WEDNESDAY, NOVEMBER 26th.—*Recruits only.* Infantry Drill and Technical Instruction, 7 to 10 p.m.

THURSDAY, NOVEMBER 27th.—*C. Company.* Technical Instruction, 7 to 10 p.m.

FRIDAY, NOVEMBER 28th.—*D. Company.* Technical Instruction, 7.30 to 10 p.m.

SATURDAY, NOVEMBER 29th.—*Headquarters* open from 10 a.m. till noon.

**An Electrostatic Oscillograph.**—A Paper by Messrs. H. Ho and S. Koto, read at a recent meeting of the Physical Society, describes an electrostatic oscillograph suitable for recording very high voltages. Two vertical bronze strips pass symmetrically between two parallel metallic plates called "field plates." They are connected at their lower ends by a silk fibre, which passes under an ivory pulley. An extremely small mirror is fixed to the strips. This arrangement constitutes the vibrator, which, mounted on an ebonite frame, is immersed in an oil bath. To the upper extremities of the strips are connected the terminals of a direct-current voltage of about 300. The alternating voltage to be recorded is connected to the "field plates," in parallel with which there are two oil condensers in series. The electrical midpoint of the direct-current battery is connected to a point between the condensers. The turning moment on the strips is proportional to the product of the momentary values of the alternating-current voltage and the direct-current voltage, so that if the latter is constant the deflection of the mirror accurately follows the variation of the former. Oil plays an important part, not only acting as a damping agent and insulator, but increasing the sensitiveness on account of its high dielectric constant. In cases where the voltage is low, but the source of energy is so limited that a sufficient current cannot be taken to actuate the ordinary oscillograph, the electrostatic vibrator may be used by applying the voltage in question to the strips, while the terminals of a high-tension battery, or influence machine, are connected to the "field plates." The instrument may also be used for recording very small currents by replacing the oil condensers by two exactly equal resistances, which are traversed by the current.

## AN ELECTRICALLY-DRIVEN WEAVING SHED

**A**LTHOUGH it is generally difficult to obtain truly comparative costs of the electrical and steam driving of textile mills, yet the continued rapid supersession of steam by electricity gives a true indication of the trend of responsible opinion. At the present time the Electricity Department of the Bradford Corporation alone has 6,590 h.p. in motors for looms, dyeing works, and other textile applications connected to its mains. Compared with some other installations, the weaving shed of John Emsley & Co. (Park Side Mills, Raymond Street, Bradford) does not take much power, but it has a complete electrical equipment, and is arranged for the comfort of the employees. Instead, however, of individual drive, a system of group driving is employed.

The weaving shed, at which some 300 hands are employed, started working about eighteen months ago, and contrary to the usual practice the building consists of only two floors. The size of the upper one, which constitutes the weaving shed, is 77 yds. by 55 yds., providing space for 841 looms for pieces from 45 to 63 in. wide, over half of which are of the Jacquard type. These are arranged in thirteen rows, driven from seven shafts by half-crossed belts. A 20-h.p. enclosed squirrel-cage induction motor, controlled only through a star-delta switch, drives each shaft through a roller-rocker chain running in an oil-bath. These arrangements are shown in the illustrations, Figs. 1 and 2. The normal motor speed is 720 r.p.m., and owing to the liberal rating this is maintained practically constant. The shaft runs at 185 r.p.m., whence the looms are driven at 130 to 160 r.p.m. Between 600 and 650 pieces per week are dealt with. The arrangement of shafting adopted allows of a reduction by about one-third of that required if the more usual plan of erecting it, parallel to the longitudinal axis of the looms, is followed. In addition, it is said that the effective lighting of the looms is more easily carried out, the risk of oil and grease being thrown into the work is reduced, and the operator is given more freedom. With individual drive these advantages are still more effectively attained. The lighting of the looms is carried out by 40-watt half-frosted metal filament lamps in specially designed steel reflectors. The lighting is arranged in four sections, and one switch controls twelve lamps. An interesting accessory of the looms is an arrangement by which each thread is weighted, while in tension, by a metal carrier which, should the thread break, falls and closes the circuit through an electromagnet which effects the transference of the driving belt to the idle pulley.

As soon as a piece is finished, it is taken to an adjoining room on the same floor, known as the piece room, where a search is made for defects. This room, which is 22 yds. by 26 yds. in area, is lighted by four 500 c.p. mercury vapour lamps provided with suitable reflectors to transform a number of the blue rays to red rays. These lamps are run four in series on 230 volts through a mercury vapour rectifier.

FIG. 1.—VIEW IN WEAVING SHED, SHOWING DRIVING MOTORS AND SHAFTING AT RIGHT ANGLES TO THE LOOMS.

Ample ventilation is obtained by means of fourteen 24 in. reversible fans driven by squirrel-cage motors. Each of these takes about 0.3 h.p., and is started by being switched direct on to the 400-volt three-phase mains. The fans are usually run so as to induce a current of air through the building, but in summer time one half is driven inducing

and the other half forcing, so that a continuous air current is ensured. In summer, therefore, the building is cooled, and in winter the air is warmed by a complete system of steam heating provided by a return fire-tube boiler fitted with induced draught.

A supply at 6,500 volts three-phase 50-cycles is given to two oil-cooled transformers in a separate part of the basement, which, however, is not under the control of the mill authorities. From these transformers a 400-volt three-phase supply is given to the mill. All the motors are supplied at this pressure. They are divided into nine circuits, each with its

FIG. 2.—VIEW IN WEAVING SHED, SHOWING MOTOR-STARTERS, SUSPENSION OF DRIVING MOTORS, AND GEARING (GEAR CASES REMOVED).

own meter, seven for the weaving shed, one for the warp twisting room, where a 15-h.p. motor suffices for all requirements, and one for the miscellaneous applications. There is only one power switch. This is ironclad, and fitted with overload and no-voltage attachments. By a system of push-buttons it can be opened from a number of points throughout the mill. The lighting is equally balanced across each of the three phases, and is therefore at 230 volts. Separate switches control this, while there are also pilot circuits controlled through another switch. All the wiring is carried in screwed conduit.

The miscellaneous applications of electricity include a goods lift driven by a 5-h.p. motor for transporting material to or from the stock-room and weft cellar in the basement, or the weaving shed on the higher floor. A room has also been set apart to provide a mess-room, but at present it is only used as a kitchen for cooking the employees' food. A 5-kw. oven with hot-plates and grill, and a 4-kw. hot-cupboard divided into two sections, with two heats each, are provided. Hot water is obtained in the summer from two 18-gallon electric urns, but in the winter the hot-water supply is used. A system of inter-communication telephones and electric clocks is also provided.

Most of the looms were previously used in a steam-driven shed, and since the change in the method of driving they have been speeded up by  $7\frac{1}{2}$  to 10 per cent. The demand is just over 100 kw., and about 60,000 units are required per annum for all purposes. The charges for power are £3 per kw. of demand plus  $\frac{1}{4}$ d. per unit less 25 per cent., so that the total power costs are approximately £600 per annum for driving, lighting, cooking, ventilating, &c. The cost of the shed including building and all the equipment, except the looms, was £12,300, the greater part of which was for the building itself. Mr. J. E. Schofield is reading a Paper early next year before the Yorkshire Local Section of the Institution of Electrical Engineers, in which some detailed comparative costs will be given.

We are indebted to J. Emsley & Co., and to Mr. T. Roles, City Electrical Engineer, Bradford, for permission to view the shed and to publish this description.

**Institution of Electrical Engineers.**—At the opening meeting last Thursday the President moved that the guarantors of the building fund be released, as the Institution now had ample funds in hand. The motion was agreed to.

## HALF-WATT LAMPS

A PAPER on high efficiency tungsten lamps, by Messrs. Irving Langmuir and J. A. Orange, of the research laboratory at Schenectady, was read before the American Institute of Electrical Engineers last month. The authors dealt at somewhat greater length than in a previous article (*ELECTRICAL ENGINEERING*, October 9th, p. 567) with the causes of blackening in metal filament lamps and the present position of the half-watt lamp in America.

The early experiments with tungsten lamps containing nitrogen were made with ordinary single-loop filaments of 0.005 and 0.010 in. diameter placed in long heater lamp bulbs. The filament was run at a temperature of 2,850° C. absolute. The efficiencies were 0.65 and 0.56 watts per c.p. respectively, and the lives were about 90 and 300 hours respectively. The bulbs opposite the filaments remained clear, although a slight brown deposit of tungsten nitride collected in the upper part of the bulbs. The candle-power remained about 80 per cent. of the initial during their entire life, failure being due in every case to breakage of the filament after it had decreased considerably in diameter. Similar evacuated lamps gave efficiencies of 0.41 watts per c.p., but the candle-power was reduced to 80 per cent. in about forty minutes, and the filaments burnt out after two to five hours. These results indicated the desirability of using filaments of large diameter, the improvement in efficiency being due to the relatively greater heat loss by convection from small wires. The life of a filament is determined largely by the loss of tungsten by evaporation, and has been found to be dependent on the relative decrease in diameter thus produced. This evaporation in nitrogen is, however, chiefly a diffusion process and probably obeys laws similar to those of conduction or convection of heat from a wire, i.e., for wires of small diameter the actual amount of tungsten evaporated would be nearly independent of the size of the wire. The rate of evaporation per unit area would thus be approximately inversely proportional to the diameter. Thus the relative lives are nearly proportional to the squares of the diameters. This was the reason that means had to be found to increase the effective diameter of the filament without decreasing its resistance. The method of winding the filament into a tightly coiled helix has proved more satisfactory than the use of a tubular filament for general purposes, though special constructions have been adopted with advantage in some cases. With a single-loop filament there is always present the tendency for the current to overheat any parts which become thinner than the rest. The overheating increases the rate of evaporation and rapidly causes failure at these "bright spots." Since tungsten is a relatively soft metal at the working temperature, it will sag too much if the helix is wound on too large a mandril, and in practice it is designed so that the amount of sagging during life will be perceptible, but will not be enough to cause too great a change in the characteristics of the lamp. If any part of the filament should, for any reason, evaporate more rapidly than the rest, this portion will have less mechanical strength than the rest and will sag more rapidly. The helix will therefore open out wherever the filament becomes thin, and this will cause increased heat loss both by convection and radiation, and thus prevent local overheating or spotting. The use of helically wound filaments increases the life of the lamp many times beyond the life that would be obtained with a straight filament running at the same efficiency. This is especially true of the smaller sizes of wire.

In ordinary lamps about 20 per cent. of the energy radiated from the filament is intercepted by the glass and causes heating of the bulb. In the nitrogen lamp there is an additional amount of heat, ranging from 6 to 40 per cent. of the input, carried to the bulb by convection. Most of this heat is convected vertically upwards, and so the relatively small upper area of the bulb tends to become overheated. Unless special precautions are taken, this overheating will cause liberation of enough water vapour to attack the filament and cause blackening of the bulb. Thus if small bulbs are to be used, the filament should be placed in the lower part, while in addition this gives a sufficient surface of glass in the upper part for the deposition of the tungsten nitride. For this reason bulbs are often made with their height considerably greater than their horizontal diameter. By special design of the bulb, satisfactory lamps have been made with bulbs of only one-half to one-third as large a volume as that of evacuated lamps of the same wattage. This means that for bulbs of the same volume the nitrogen lamps give roughly from five to ten times the candle-power of evacuated lamps. The upper parts of the

bulbs are often 100 to 200° C. or more, while the lower parts are sometimes much cooler than this, although closer to the filament. Several special varieties of heat-resistant glass have been used for the bulbs, making considerably smaller ones possible, as well as rendering it easier to get rid of water vapour. Transparent quartz bulbs have been tried, but do not seem to have sufficient advantage over some of the special glasses to offset their present high cost.

For some of the larger size lamps taking from 20 to 30 amperes it has been necessary to devise special types of leading-in wires. Platinum has been discarded entirely, even in the smaller sizes, and generally alloys having the same expansion as the glass are used. In many of the larger lamps the leading-in wires pass through the lower end of the lamp, so that they may be short, but in some cases they are brought in from the top. This requires more care in the construction of the seal if it is exposed to the heat from the convection currents. Deflecting screens are sometimes used.

The authors say that it may be worth while, even if no gain in efficiency over the evacuated lamp results, to use nitrogen in low-current lamps, so as to obtain better colour of the light and higher intrinsic brilliancy. With regard to the upper limit of current, a lamp taking 60 amperes and giving 6,600 c.p. at 0.4 watts per c.p. has been successfully run. As the size of filament, and therefore the current, is increased, a limit in efficiency of 0.2 watts per c.p. is fixed by the melting point of tungsten. However, unless special expedients are employed, the cooling effect of the leads lowers the efficiency inversely as the pressure, but the effect is nearly independent of the size of wire. This is not regarded as being very important for lamps designed for working above 10 volts.

No serious difficulty, say the authors, has been met in making high voltage lamps. In nitrogen at atmospheric pressure there is no tendency toward arcing, even at 250 volts. Many lamps taking 6 or 7 amperes at 110 volts have been made up and run at 0.6 to 0.7 watts per c.p. with a life of over 1,000 hours. The filament temperature is 400-600° C. higher than that of ordinary lamps, while the light approaches nearer to daylight in colour than any other illuminant except the D.-C. arc and the carbon di-oxide Moore tube. The intrinsic brilliancy of the filament is about 1,200 c.p. per sq. cm., compared with about 1,150 c.p. per sq. cm. for ordinary metal filament lamps. The light practically never falls below 75 per cent. of its initial value, and generally the filament fails by fracture, while the light is well above 80 per cent. of its initial value. This decrease is due to the filament sagging and not to deposit on the bulb.

The candle-powers given in the paper were taken in a horizontal direction perpendicular to the filament if that was in the form of a loop, and measurements have shown that with a helically-wound filament the distribution of light in a horizontal plane is almost perfectly uniform. The ratio of mean spherical to maximum (practically mean) horizontal candle-power has been found to average about 84 per cent. for lamps with single loops of helically-coiled wire. Projector lamps in which the maximum light is thrown in a given direction are being designed.

The method of photometry used in the tests was to assume the temperature to be the fundamental variable, and this was determined by colour match with the Lummer-Brodhun photometer. The temperature was defined by the equation  $T_{\text{abs}} = 11,230 \div (7.029 - \log H)$  where  $H$  is the intrinsic brilliancy of the filament in international candle-power per sq. cm. of projected area. A number of temperature standards are made from well-seasoned high-voltage lamps with the anchors tightly pinched into the filaments so as to prevent variable cooling effects. The readings are determined by comparison with the light from a portion of a stout filament (say 10 mil. or 0.025 cm.), which can be accurately measured. As these standard lamps cannot be run at the same temperature as the nitrogen-filled lamps, a special blue glass was found, by means of which a good colour match could be obtained. This glass was made into screens of different intensity. It may be shown theoretically, and is confirmed by experiment that if  $T$  is the temperature of the filament viewed through the screens  $A, B, C$ , &c., and  $T_1$  the temperature of a filament which matches the other, then  $1/T - 1/T_1 = a + b + c$ , &c., where  $a, b, c$ , &c., are the constants of the screens  $A, B, C$ , &c. When the constants are once obtained, a number of standard temperatures ranging from 2,250° C. to 3,600° C. are available.

During the discussion, Mr. J. W. Howell took exception to the statement that ordinary tungsten lamps fail owing to blackening of the bulbs. This was only true, he said, of large lamps. The ordinary 40-watt lamp remained useful until the filament

broke. He had long recognised three kinds of blackening:—(1) Due to evaporation, which advanced uniformly during the life of the lamp; (2) irregular or mottled discolorations, traced to the presence of a residual gas; and (3) discoloration due to water vapour. The effect of this was different on different lamps, as shown by samples exhibited. Replying to the discussion, Dr. Langmuir said that he attributed the greater brilliancy of the inner surfaces of the helix to cross reflection of the light, as the temperature there could only be a few degrees higher than on the outside. At very low pressures uniform blackening deposits could be obtained on the glass, while conversion currents were set up only at higher pressures. He did not think that nitrogen-filled lamps would be made much

smaller than 500 watts, but lamps up to 25,000 or 50,000 c.p. with ultimate efficiencies of 0.3 watt per c.p. could be made. The results of experiments had so far shown that argon was better than nitrogen, and as soon as this gas became available on a commercial scale, it would be substituted. He thought it could be made cheaply on a large scale. The pressure of the nitrogen in the bulb was about two-thirds of an atmosphere, so that it did not exceed one atmosphere when in use. No advantage was indicated by using higher pressures, and in case of fracture of the glass, there would be more likelihood of the broken glass being thrown outwards. The lamps did not flicker on 25-cycle alternating-current circuits.

## PRESSURE RISES

THE subject of Mr. W. Duddell's address to the Institution of Electrical Engineers is well illustrated by some happenings on the Brighton supply system, where special methods have to be taken to meet phenomena of this kind. Before giving our report of Mr. Duddell's address, we will briefly indicate the measures taken at Brighton, information regarding which has just been sent us by Mr. J. Christie (Borough Electrical Engineer).

The matter arose out of a curious mishap last January (see *ELECTRICAL ENGINEERING*, January 9th, p. 25), when the failing of one phase of a circuit-breaker to come out on a bad fault caused the burning out of an earthing resistance, the connection to which became red hot, seared a hole in a lead-covered machine cable and caused another short. Incidentally there were heavy surges on the system. Since this accident the question of earthing the neutral and protecting the high-tension mains against surging has been gone into very thoroughly, with the result that an entirely new earthing resistance capable of carrying 225 amperes has now been provided, the neutrals of the several machines being connected through oil switches to a common "earth" bus main, one machine only at a time. On the high-tension

in full in the *Journal* of the Institution of Electrical Engineers on December 1st.

The pressure rises dealt with were those which occur in the normal working of plant, and were divided under three headings, as those due to resonance, switching, and arcs and sparks. In connection with the first, he pointed out that there could hardly ever be resonance with the fundamental, because the capacity current of the cables was much smaller than the short-circuit current of the generators. It often happens, however, that resonance may be obtained with the fifth or higher harmonics if these are present. Although in most modern machines a good wave form is obtained, yet there are numerous old machines, in which the higher harmonics are present, still in use. With a star-connected three-phase machine it is generally said that no third harmonic is present, and this is true as regards the lines, but these harmonics may be present between the lines and earth, so that it is not safe to assume that there is no possibility of resonance. Again, the effect of varying the speed of a generator connected to the mains may cause resonance at particular speeds. A special case not sufficiently referred to in available literature, said Mr. Duddell, is the possibility of resonance due to switching off a motor or rotary at the end of a long line, by tripping the switch in the distant station. Another case which has been known to arise is that of resonance of a thirteenth harmonic in the circuit of an unloaded instrument transformer connected to an earthed star-connected three-phase system. Illustrations of these phenomena, showing how great may be the voltage rises, were experimentally demonstrated.

With regard to switching, the rises due to switching off a self-induction or switching on a capacity are well known, but the action of the switch contacts is often very uncertain, giving varying charging and discharging effects, as was shown by the oscillograms. When switching off an inductive circuit containing iron, there are several sources of loss, eddy currents, hysteresis, &c., which tend to damp out the rises, but if no metal is present then these losses are absent, so that the capacity or self-induction of cables may prove of importance even though their values may be small. Owing to reflection of the pressure waves at the end of a long unloaded line, very great rises may be experienced, but a small load on the end will prevent their occurrence. Another effect is the localisation of pressure on the end coils of machines. The leads from machines to their switches should be as short as possible, as oscillations having a high frequency and steep wave-fronts may be set up. Although they are too small to do much damage, yet, if they persist for any length of time, the insulation on the end turns of the machines may be punctured.

The phenomena of pressure rises resulting from arcs and sparks are rather obscure. The arc has a tendency to "shut the current off with a snap," and so rapidly reduces the current, but all the causes tending to put out the arc are far from being properly known at the present time. In certain cases where capacity and self-induction in parallel with a spark gap can be fed through self-induction, intermittent surges having frequencies as low as one per second may be set up, and these may prove very harmful to the system. The instability of the arc was illustrated by a water analogy. In this water is allowed to flow through a valve held down by an electromagnet against a spiral controlling-spring, and an indicating tube connected to the system shows violent fluctuations in water pressure. If one takes the musical arc and arranges it so that it will just not resonate to a particular note, then if a hydro-carbon vapour be introduced into the arc it will be found that the note can be produced. This may have some bearing on breakdowns of cables laid in bitumen, &c., where hydro-carbon gases are always present. Another important effect which should not be overlooked, is that due to the presence of a magnetic field, which may also cause an arc to resonate at a certain frequency, whereas if such a field is absent no such effect occurs.

It has been said that no pressure rises take place when a circuit is opened by an oil switch, but it has been found that when small currents, for example, the magnetising current of a transformer, are switched off through an oil switch, very great rises may take place, although with larger currents no rises take place at all. This phenomenon has so far not been ex-

SPARK GAPS AND RESISTANCES AT BRIGHTON.

feeders and bus bars the old type of spark arresters have been removed and the latest type of "Brazil" patent horn-break arresters have been installed, each fitted with a carbon resistance in series with the earthed horn which limits the current to less than half an ampere. These gaps are set to jump at 10,000 volts, the pressure between phases being 8,000 volts, with the neutral point earthed. In the earth wire a small transformer is fixed, and whenever the gaps spark across, a relay is energised which rings a bell on the switchboard. Some of the machines are large induction motors of 1,500 h.p., started direct off the high-tension bus bars, and frequently, when these machines are started up, a slight surge takes place which rings the bell, proving that for years the cables and end windings of the machines must have been subjected to considerable stresses which have not hitherto been noticed. This device acts as a most efficient "safety valve" to the whole system, and will doubtless tend to prolong substantially the useful life of the whole plant.

The address by Mr. W. Duddell, F.R.S., last Thursday, was illustrated by numerous experiments, and was given to one of the largest and most enthusiastic audiences that has ever filled the lecture theatre of the Institution. The address will appear

plained. Similar effects are found when a fuse blows, especially if it is a fine one, for then no vapour is formed, and a complete rupture of the circuit may take place within half a cycle. Very complicated surges may take place in these cases. It is also important that there should be no capacity between the switch contacts, as the effect of this is to suppress the arc more quickly, and to give greater pressure rises. An important effect due to short circuits on a transmission line was then shown. A short line in the lecture theatre was fed at 5,000 volts. When suddenly switched on, the pressure rise at the far end was sufficient to bridge a three-eighth inch gap. A model line, consisting of induction coils and capacities slightly larger than they would be in practice, was similarly treated; when a fault was put on at the generator end, a rise in pressure from 200 to 1,000 volts was shown. Very large rises due to periodic short circuiting of the line through a relay connected to different points were also demonstrated. In conclusion Mr. Duddell emphasised that enough was not known as to why big current arcs snapped out, although no pressure rises might result. It was possible that the magnet field in which they were had something to do with the case.

### CRYSTALLISATION EFFECTS IN TUNGSTEN FILAMENTS

IN the course of a Paper on the tungsten lamp and its development, read by Dr. A. Lederer during the summer before the Austro-Hungarian Union of Electricity Works, some interesting particulars were given as to the crystallisation effects produced by continued usage upon tungsten filaments. With pure tungsten filaments, writes Dr. Lederer, a disadvantageous crystallisation phenomenon has been observed to take place, more especially if alternating current

FIG. 1.—SQUIRTED PURE TUNGSTEN FILAMENT BEFORE USE.

FIG. 2.—THE SAME FILAMENT AFTER 600 HOURS ON ALTERNATING CURRENT.

is employed. It is a well-known fact that it is not necessary in order to crystallise a body that it should be melted or completely dissolved, but mechanical and thermal influences suffice to bring about this modification. In the case of tungsten incandescent filaments which are exposed to very high temperature, crystallisation takes place in a comparatively short time. When used with continuous current the thickenings and wrinkles appear only in a longitudinal direction. When burnt on A.C. the adjacent surfaces, owing

FIG. 3.—PURE TUNGSTEN FILAMENT AFTER 1,000 HOURS ON CONTINUOUS CURRENT.

FIG. 4.—TUNGSTEN FILAMENT WITH ADDITION OF RARE EARTH METALS AFTER 1,000 HOURS ON ALTERNATING CURRENT.

to the dynamic influence of the surrounding field, are subjected to a sliding movement, which, if it takes place in a direction perpendicular to the axis of the filament, causes considerable displacement of some parts of the filament, which eventually lead to their being separated. It has been found that this drawback may be avoided by certain additions of compounds of the rare earth metals (see Austrian patent No. 41,247/06, Westinghouse Metallfaden Glühlampenfabrik). With such additions the tungsten incandescent body may be

used equally well with alternating as with continuous current, be it filament or wire. In this connection, an essential improvement of the squirted filaments, with such additions as regards their mechanical structure, may be mentioned, such filaments being quite ductile in the cold state. It is well known that this displacement due to crystallisation also gave considerable trouble in the earlier days of tantalum lamps run on alternating current, and microphotographs of filaments thus affected have been reproduced in *ELECTRICAL ENGINEERING* (Vol. I., pages 109, Jan. 17th, and 153, Jan. 24th, 1907). In order to illustrate the differences in the conduct of various types of filaments, some microphotographs of tungsten filament are given. Fig. 1 represents an ordinary squirted tungsten filament previous to being burnt, and Fig. 2 shows the same after 600 hours on alternating current. Photographs of the same filament after 1,000 hours' burning showed the characteristic displacement of part of the filament referred to above. The effect of continuous current is shown in Fig. 3, which represents a filament after 1,000 hours' burning. Fig. 4 shows a squirted filament with an addition of rare earth metal after 1,000 hours' burning without any detrimental displacement, in spite of alternating current having been used. The effect does not seem to be produced to any extent in wire-drawn filaments, even on alternating current. Microphotographs show a loss of the brightness caused by the drawing and a mottled appearance somewhat similar to Fig. 4, but without any breaking-up effect.

### CORRESPONDENCE

#### SCHOOL LIGHTING.

To the Editor of *ELECTRICAL ENGINEERING*.

SIR,—I have to thank you for the notice of my Paper in *ELECTRICAL ENGINEERING* dated November 13th, 1913, but must quarrel with you over the statement that I am in error in stating that metallic filament lamps are more affected by variations in voltage than are carbon ones. If you will refer to the Paper, you will notice that I was particular in stating that variation would be more pronounced on flickering voltage circuit. By flickering I do not mean permanent pressure change, but the rapid voltage flickers that frequently occur when the station regulator is not working properly. I have experimented largely with all kinds of lamps, and have published elsewhere the fact that the resistance of tantalum, for instance, increases from 15·8-83·0 microhm per cm. cube when the lamp is running, thus making for inherent regulation. I was led to the remark re flickering when testing a large batch of both carbon and metal lamps; the pressure through some cause was varying very rapidly, and the effect was most pronounced in the case of the metal lamps. The flickering has been observed on alternating-current circuits, and it can only be due to the difference in specific heats, that of carbon being roughly 10 times that of tantalum. The time lag in switching on in the case of a carbon lamp is also probably due to the same cause.

Trusting that you will make this matter clear.

Yours, &c.,

D. H. OGLEY.

Royal Technical Institute,  
Salford, Nov. 17th, 1913.

[We are glad to hear of Mr. Ogley's experiments. We are really quite in agreement with him, but we were a little at cross purposes, as we had in mind the slower variations of voltage which undoubtedly affect the carbon lamp more than the metal filament lamp. The question of speed of response, which predominates in the case of the quicker variations referred to by Mr. Ogley, is a different matter.—ED. E. E.]

**Standardisation of Plugs.**—At a Council Meeting of the Incorporated Municipal Electrical Association, on Friday last, the question of the standardisation of two-pin plugs and other small appliances in common use by the general public was brought up for consideration, and a sub-committee was appointed to deal with this matter. Mr. A. C. Cramb, of Croydon, was appointed Hon. Secretary of this Committee.

**Metal Filament Lamp Patents.**—An error occurred in the article on "Metal Filament Lamp Patents" which appeared on page 627 of our last issue. Claims 1 and 2 to Patent No. 21,513\*/06 should read as follows:—(1) The method of working tungsten, which consists in subjecting the metal in a coherent form to the action of heat while it is being operated on or manipulated. (2) The method of working tungsten which consists in heating the coherent metal by means of an electric current while it is being operated on or manipulated.

### A NEW TWO-RATE TARIFF SYSTEM

IN A Paper read before the Birmingham Local Section of the Institution of Electrical Engineers on Tuesday, Mr. H. H. Perry described a proposed two-rate system of charging in which time control is dispensed with and an automatic switch is used to change over from one meter to another, according to the magnitude of the load or the proportion of lighting to power and heating. The construction of the switch is shown in Fig. 1. An ordinary single-pole change-over switch is employed, one arm of which is attracted by the lighting-circuit current. It is freely pivoted about its centre, and a balance weight is provided, the position of which is adjusted to give any proportion of the consumer's lighting between, say, 5 per cent. and 25 per cent. at the low rate.

Auxiliary contacts are provided for maintaining continuity of the circuit when changing over. The switch is normally on the low-rate side, and two of the ordinary stock pattern of meters are employed. The loss in the instrument is about 4 watts for continuous current and 8 to 10 watts for alternating current. In the case of a consumer taking practically all his current for lighting, with no separate circuit, all the current passes through the high-rate meter or the low-rate meter, and the switch is adjusted by the balance weight or by the air-gap, so that all currents less than a given fraction of the maximum current are registered

FIG. 1.—GENERAL ARRANGEMENT OF SWITCH.

FIG. 2.—CONNECTIONS FOR INDEPENDENT POWER CIRCUIT.

on the low-rate meter. When a separate power circuit is used the connections are arranged so that the low-rate meter will register the whole of the power load, and up to 25 per cent. of that required by the lighting, when the switch is on one side, and when the switch is on the other side the low-rate meter will meter the power only, and the high-rate meter only the lighting. Another arrangement is shown in Fig. 2. So long as the power system is in use, the low-rate meter will meter all power and any desired proportion of the lighting, since the pull of the magnet is neutralised to the required extent. Otherwise the operation is the same as in the last-mentioned arrangement—that is to say, the lighting reverts to the high-rate meter after 5-25 per cent. has been exceeded.

Mr. Perry argues that provided the heating peak, assuming that there is one only, does not coincide with the lighting peak in magnitude and length of time, this arrangement should prove acceptable, as the mere granting of a low flat rate for power by many authorities is an admission that the diversity factor is large enough to allow the coincidence of double peaks to be ignored. It has the advantage of giving to the consumer the facilities for using many useful appliances from the existing lighting circuits at a low rate, and the load so provided should do much to improve the load factor.

In an appendix methods of using the switches in conjunction with one meter with sub-divided coils are suggested.

### JOINTLY-OWNED MUNICIPAL AND COMPANY ELECTRICITY WORKS

FROM time to time, allusions have been made to those electricity works and electric power systems in Germany in which the ownership is vested partly in the hands of the local authorities concerned and partly in companies, both of whom are represented in the management of the concern, and particular interest therefore attaches to a report on the subject by Sir Francis Oppenheimer, Commercial Attaché to his Majesty's Embassy at Berlin, which has just been issued. The report is "No. 685 Miscellaneous Series, Diplomatic and Consular Reports," and may be obtained under this title from Messrs. Wymans & Sons, Ltd., Fetter Lane, London, E.C., for the price of 2d. It explains clearly the various methods employed in Germany for arranging for a joint interest in electric power undertakings by private concerns and public bodies, setting forth the reasons which led to this policy, the advantages to be derived from it, and the mistakes to guard against. Fifteen such undertakings are dealt with. The largest of these is the Rheinisch-Westphälisches Elektrizitätswerke, the total share and debenture capital of which approaches £5,000,000, and in which no less than sixteen Local Authorities have large holdings of shares. The various undertakings supply electric light, power and tramways, several are in mining districts, and, moreover, the possibility is not excluded of arrangements being made in the future for the supply of main railways, as these are gradually electrically equipped.

Comparing the conditions in Germany with those obtaining in this country, there seems to be no reason why, in many cases, similar arrangements could not be arrived at advantageously here, by amalgamations of existing electricity undertakings.

**The Future of Electricity Supply.**—Mr. J. A. Robertson, in his inaugural address to the Scottish Section of the Institution of Electrical Engineers on Tuesday of last week, referred to the tendency towards the concentration of power generation in large central stations, which was largely due to recent improvements in the steam turbine and the development of high-tension multi-phase transmission. He looked to the internal combustion engine for higher efficiency in fuel utilisation, but preferred the producer gas engine to the Diesel engine on account of the dependence of the latter mainly on foreign fuels. It was possible a portion of the heat now wasted in the exhaust might be recovered by means of suitable boilers. With a combination of this kind he thought that the present efficiency of about 15 per cent. might be raised to about 25 per cent. He did not think that the backward state of the power industry was as much due to restrictive legislation or municipal obstruction as was generally supposed. We have to face, he said, the position that these undertakings are already in operation, and the problem of cheap supply for all purposes will not be solved by purchasing a municipal station here or supplying in bulk elsewhere. The question is too big to be dealt with by isolated arrangement, and while co-operation between the various local authorities themselves and between local authorities and power companies may require to be entered into as a temporary expedient, the ultimate solution must come from a scheme dealt with on broad national lines, and would justify the appointment of a commission by the Government to investigate the whole question, with special regard to suitable generating centres, economic radius of supply, standardisation of voltage, and the purchase of existing interests. Passing on to technical matters, he advocated two-wire and not three-wire distribution, commented on the increasing use of central station batteries, the possibilities opened up by the Edison battery for road traction work, and the directions in which heating and cooking plant is improving.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published November 13th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**  
19,006/12. **Metal Filaments, &c.** H. KAST. Metals and metal oxides are obtained in a minutely divided state by heating the metal salts of the nitro-phenols till the metal or oxide separates itself. The salts may be diluted before heating with indifferent substances, or mixed with oils, fats, tars, &c.

23,861/12. **Kettles.** A. F. BERRY. An internal heating element is arranged to retain some liquid when the kettle is tilted. The element may be made hollow, so as to emit a sound should the liquid fall below a certain amount. It may also be provided so that liquid cannot be poured out unless the heating circuit is opened—this may be effected automatically by tilting the kettle. Nine figures.

23,940/12. **Current Indicator for Heating Apparatus.** A. F. BERRY. An indicator to show whether high or low heat is on consists of a resistance with + temperature coefficient and indicating lamp in series, connected in parallel with a resistance whose value diminishes with mechanical pressure and increasing temperature. The mechanical pressure is obtained from the expansion of the other resistance. Alternatively, the latter resistance may be in shunt to the lamp alone, or the lamp may simply be in parallel, with a constant resistance. Six figures.

25,356/12. **Alternators for Wireless.** E. GIRARDEAU. A resonance alternator for stations using a singing spark has a short-circuit current less than the normal current which the armature can withstand. The construction is similar to that of an induction motor, and the total sectional areas of the field and armature copper are approximately the same, so that the emission of signals is effected by varying the exciting current owing to the reduction of the self-induction of the field winding. One figure.

27,348/12. **Astatic Electro-Dynamometers.** J. T. IRWIN. Two coils on the horizontal axis are connected so that the fluxes oppose. In the resulting radial flux is a coil with its centre on the axis of the two coils, and with its plane vertical and free to rotate about a vertical axis. This coil is wound so that the currents pass the same way up the sides and down the centre. The torque is measured in any well-known way. Four figures.

28,929/12. **Conduit Fittings.** J. H. JACKSON. The movable member of the coupling is made eccentric exteriorly and the socketed fitting formed with the companion interior surface eccentric. Ten figures.

1,207/13. **Pressure Regulation.** A. H. OLMSTEAD. An additional machine is connected across the field winding, or in shunt with a series resistance to it, of the generator (or exciter). The excitation of the additional machine is controlled by an automatic regulator. Two figures.

3,432/13. **Telegraph System Unaffected by Static Discharges.** SIEMENS & HALSKE. High-frequency currents are used in the signalling circuit. This is normally closed and emitted through choking coils. The signalling currents work a special design of vibration relay. One figure.

15,498/13. **Vehicle Brakes.** E. V. HARTFORD. The brakes are worked by a high-speed reversible motor through reduction gear, link-work, counter-shaft, and friction clutch. The braking power is automatically cut off when a predetermined braking effort is exerted. At the same time the motor itself is braked. Four figures.

15,674/13. **Wireless Telegraph Receivers.** J. G. BALSILLIE. A receiver consists of a looped circuit with one leg containing a reactance variometer and an adjustable condenser, while the other contains an adjustable condenser only. Across this condenser is an adjustable oscillation circuit connecting with the detector circuit, which includes an adjustable condenser in parallel with a telephone and in series with a quantity detector. Two oscillation frequencies may be used, one for dots and one for dashes, if the connections are slightly modified, but in each case the group frequency is the same. Three figures.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** OKUN, 2,125/13.

**Distributing Systems, &c.:** ROUTIN [System employing motors controlled synchronously from a distance] 13,084/13.

**Dynamos, Motors, and Transformers:** PLAISANT, 26,177/12; SCOTT [Coil winding machines] 3,516/13; HOWORTH (*Ryder*) 9,070/13; A. E. G. [Cooling] 16,391/13; SIEMENS DYNAMO WORKS and TAYLOR, 16,526/13.

**Electrometallurgy and Electrochemistry:** VON RECKLINGHAUSEN, HELBRONNER, and HENRI [Vapour electric apparatus] 13,490/13.

**Heating and Cooking:** SIMPLEX CONDUITS and TAYLOR [Oven] 24,586/12.

**Ignition:** BURTON and YATES, 6,434/13.

**Switchgear, Fuses and Fittings:** PINKERTON and WASON [A.C. and D.C. motor starters] 21,974/12; STERLING TELEPHONE Co. and BELL [Contact breaker for bells, &c.] 24,439/12; B. T.-H. Co., GARTON and WATSON [Regulating mechanism for distributing systems] 27,758/12; COVENTRY and RUSHTON [Conduits] 28,979/12; HIRST and CASH [Indirect lighting shades and reflectors] 29,348/12; B. T.-H. Co. (*G. E. Co., U.S.A.*) [Circuit breakers] 4,945/13; ELEC. & ORDNANCE ACCESSORIES Co. and HOWELL [Fuse-holders] 5,836/13; GWYNN and CLERK [Reflectors] 10,152/13; JAKOBSEN and JENSEN [Combined switches and plug contacts] 14,330/13; LEITNER [Switches] 21,751/13.

**Telephony and Telegraphy:** SIEMENS BROS. & Co. and PETITHORY [Lamp jack strips] 25,237/12; MAJORANA [Wireless telephony] 10,153/13.

**Traction:** FORREST [Motor casings for tramcars, &c.] 26,414/12.

**Miscellaneous:** SOUTH MET. GAS and SOMMERVILLE [Lighting gas burners] 26,156/12; MAJOR and SMITH MAJOR & STEVENS [A.C. solenoids] 26,935/12; FAIRBROTHER (*Vesta Accumulator Co.*) [Adjustable electric lamps] 29,698/12; FOWLER [Signalling disagreement between engine control gear and order telegraph indications] 3,266/13; KRAUS and OPPEN [Electrostatic separators] 6,336/13; NELSON [Mine signalling] 11,166/13; HEDLUND [Transferring pressure from rigid bodies to insulators] 16,262/13; BRUNS [Remote control of valves electromagnetically] 18,526/13; ASH [Rat-traps] 19,496/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Dynamos, Motors, and Transformers:** SIEMENS-SCHUCKERT. [Oil-insulated transformers, &c.] 24,117/13; [Geared A.C. motors] 24,126/13; SCHERBIUS [Transformers] 24,212/13 and 24,306/13.

**Electrochemistry:** ROSSI [Electrodes for production of nitric oxide] 23,959/13.

**Ignition:** SIEMENS & HALSKE [Spark plugs] 18,924/13.

**Miscellaneous:** WHITHEAD & Co., A.-G. [Gyroscopic steering for torpedoes] 18,859/13; O'KEENAN [Synchronised electrically controlled clocks] 23,570/13; SIEMENS-SCHUCKERT. [Driving of rotary printing-presses and paper calendaring machines] 24,017/13.

The following Amended Specification may now be obtained.

**Miscellaneous:** A. McNAB [Temperature indicators] 14,653/13.

## Opposition Entered to Grant of Patent

2,546/13. **Visual Mines' Shaft Signals.** J. CLOSE. Visual signals are given by local batteries at the pit bottom and winding-engine house through switches controlled by pull wires or ropes (ELECTRICAL ENGINEERING, Mining Section, Oct. 2nd, p. 559).

## Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

23,476 of Nov. 24th, 1899. **Colour Screens.** A. DUTTON and W. M. GARDNER. The claims cover the use of coloured screens or reflectors, or a combination of the two, so selected as regards colour and tint as to make the light resemble daylight. The addition of a cupric salt to the glass is covered.

23,501 of Nov. 24th, 1899. **Vacuum Tube Lighting.** W. L. WISE (*Moore Electrical Co., U.S.A.*). The tubes are excited directly, or through a transformer, by high-frequency currents having as nearly as possible a flat-topped wave. An alternator to effect this has the rotor and stator teeth so proportioned that the total magnetic flux is approximately always the same. The terminals of the tube are made of metal foil so as to increase the capacity, which may be supplemented by condensers.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** SIEMENS BROS. (*Siemens & Halske*) [Fault indicating and signalling between central and sub-stations of distributing system] 15,898/08; B. T.-H. Co. (*G. E. Co., U.S.A.*) [Pressure regulation] 16,299/08.

**Incandescent Lamps:** H. KUZEL [Paste for uniting metal filaments to leading-in wires] 15,462/05.

**Switchgear, Fuses and Fittings:** W. J. DAVY [Thermal circuit breakers] 15,936/08; T. J. and E. RORKE [Mercury switch] 15,949/08; E. GARSIDE [Motor starter] 16,126/08.

**Traction:** A. N. CONNETT [Points for conduit tramways] 15,590/05; E. A. MITCHELL [Surface contact switch] 17,532/07.

**Miscellaneous:** W. L. WISE (*A-G "Magneta," Switzerland*) [Secondary electric clock escapements] 15,460/01; [Master clock escapements] 15,461/01; SIEMENS BROS. (*Siemens & Halske*) [Remote indications of compass readings by bolometer type instruments] 16,979/02; A. SMITH and C. SOUTHALE [Weighing] 16,352/08.

## ANNOUNCEMENTS RELATING TO PATENTS.

*Small Prepaid Advertisements with regard to Patents, &c., are inserted on this page, facing our Patent Record, at 1d. per word (minimum 5s.); three insertions for the price of two. Rates for displayed and card advertisements on application.*

*Advertisement matter, accompanied by a remittance, should be addressed to the Kilowatt Publishing Co., Ltd., 203 Temple Chambers, London, E.C.*

**PATENTS.** "Improvements in or Appertaining to ADDING MACHINES." The Proprietors of THE DUPLEX ADDING MACHINE Co.'s British Patents Nos. 23,890 of 1907, 10,663, 10,664, 10,665, 10,666, and 10,667 of 1908, are desirous of licensing them to British Manufacturers on reasonable terms to ensure their manufacture and development in Great Britain, or of selling the patents outright. For full information address inquiries to W. P. THOMPSON & Co., Chartered Patent Agents, 6 Lord Street, Liverpool.

The Proprietor of the Patents Nos. 24,702 of 1908 and 24,708 of 1908 for "Improvements in and relating to ELECTRIC FUSIBLE CUT OUTS" and "Improvements in SEAL FASTENINGS," is desirous of entering into arrangements by way of license and otherwise on reasonable terms, for the purpose of exploiting the same and ensuring their full development and practical working in this country. All communications should be addressed in the first instance to:—Haseltine, Lake & Co., Chartered Patent Agents and Consulting Engineers, 28, Southampton Buildings, Chancery Lane, London, W.C.

**REMOVAL.**

Mr. J. G. LORRAIN, M.I.E.E., M.I.Mech.E., Chartered Patent Agent, has removed his office from Norfolk House, Norfolk Street, Strand, W.C., to  
**Staple Inn Buildings, High Holborn, London, W.C.**

**John E. Raworth,**

Queen Anne's Chambers, Chartered Patent Agent  
39, Broadway, Westminster, London, S.W.

**QUESTIONS AND ANSWERS  
BY PRACTICAL MEN****RULES.**

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

**QUESTION No. 1,365.**

When a turbine is running, what are the indications of trouble with the blading?—J. O.

(Replies must be received not later than first post, Nov. 20th.)

**ANSWERS TO No. 1,363.**

An Otis elevator designed to lift 2,000 lb. is used for passengers only, and at times, with only two or three persons on, will not travel at more than half speed. At other times, when the car is run down to the limit switch, the potential switch will drop off. A short time ago, whilst the car was on its downward journey (with six persons on), a sudden drop of about two feet was experienced, and on examination the rope was found to have dropped over the side of the drum. What is the cause of slow running? Why did the rope drop off the drum?—C. W. A. (Western Australia).

The first award is given to "L. Y. T.," who writes as follows:—

Without further information as to the method employed for controlling the rate at which the starting resistances are cut out, it is only possible to indicate one or two directions in which the trouble may lie. If there is a series of clapper switches or contactors which cut out sections of the resistance successively as the back E.M.F. of the motor rises or as the current decreases, it is possible that when the lift is lightly loaded the motor starts getting up speed so quickly that some of the contactors or the relays controlling them have no time to act, or due to their bad adjustment, come on in the wrong order, and thus part of the resistance is left in circuit, causing the motor to run at a low speed. Another possible explanation is that when the lift is lightly loaded, the current taken is not sufficient to hold the magnetic brake off. This can probably be remedied by adjusting the spring. The tripping of the potential switch by the limit switch is possibly due to wrong connections. The dropping of the rope off the side of the drum is a serious matter, and is most likely due to the drum being out of line owing to faulty erection or subsequent subsidence.

No other award is made.

**Electricity as a By-Product.**—Under this title a Paper was read at the annual general meeting of the Institution of Municipal Engineers on Nov. 7th, by Mr. R. J. Spencer-Phillips. He showed that with a load factor of about 80 per cent. the total cost of production (excluding management, offices, &c.) of electricity may be about 0.364d. Some instances in support of this figure were cited, and the conclusion reached that, wherever there are mills or factories, in however small a town or district, it would appear sound policy for the local authority to undertake the supply of electricity, and, if possible, by entering into an agreement with the owners, to put down the necessary plant actually in the building itself. There would be then the course open of either installing an up-to-date boiler plant with back-pressure turbines, and selling both electrical energy and low-pressure heating steam, or if, as might well be the case, a mill already had a suitable boiler plant, an arrangement might be agreed upon by which payment is made for the use of the steam between 150 lb. pressure and 30 lb. pressure, or whatever the required range may be. The electrical energy produced by this steam would then be sold, and the steam itself returned to the mill at the required back pressure. The electricity so obtained could be sold at a low figure.

**The Present Outlook in Electrical Engineering.**—Mr. G. Marshall Harriss gave the Chairman's address at the opening meeting of the Dublin Local Section of the Institution of Electrical Engineers on Friday last. Reviewing the progress of the electrical industry in Dublin, he considered it highly satisfactory in spite of the local labour trouble. The Tramway Company, which had been most violently attacked by the strikers, had suffered the least. On the technical side there was nothing sensational to note, but the flexibility and adaptability of electrical methods were being recognised in fresh directions every day. Municipal authorities were standing in the way of expansion, as witness their vigorous and successful opposition of the Power Bills. The electric tramways of the kingdom had not much increase of mileage to show for the past year, but the number of passengers carried had increased by 220 millions, while the number carried by the railways had fallen. There was a tendency towards better and heavier equipment, and the use of phosphor-bronze in place of hand-drawn copper was now common. In the generation station, owing to continued increase in the price of coal, economies hitherto neglected as not worth troubling about were now being carefully studied. Higher steam pressures and greater superheats were being considered, and the speaker viewed with some apprehension the movement in that direction. The gas-fired Bonecourt boiler promised to revolutionise costs in the boiler-house. In spite of elaborate methods of keeping accounts and records, he thought many engineers were working in the dark as to the amount of money spent in the upkeep of machinery. It was difficult to decide as to what extent it was economical to spend money on the upkeep of a particular machine. Records of repair work should be more complete, and he advocated a special repair and depreciation account for each unit. Dealing with the status of the electrical engineering profession, Mr. Harriss considered that the alteration to the Rules of the Institution of Electrical Engineers providing for the graduate class and for the examination of candidates had done a certain amount of good, but the fact remained that, legally, engineering was a trade and not a profession. As engineers we had no standard of qualifications and no legal rights. The medical profession sixty years ago was in precisely the same predicament as the electrical one to-day. The Medical Act of 1858 showed what had been done in their case, and what was necessary to be done for the electrical engineer. The way to raise the status of the engineer was to make his profession recognised by the law, and the Medical Act showed us how to do it.

## ELECTRIC TRACTION NOTES

In connection with the recent proposal to purchase the Stirling electricity and tramways undertakings, the Borough Electrical Engineer, Borough Surveyor and Town Clerk have prepared a report dealing with the proposition that the Corporation should purchase the existing Tramway Company and convert the lines to electric traction, at the same time carrying out certain extensions. The estimated expenditure on the reconstruction and extension work is put at £63,100, to which is added £12,000 as a fair price for the horse tramways undertaking, and £3,000 for the necessary Parliamentary and other expenses, making a total of £78,100. This estimate is based upon current being charged at 1½d. per unit for the first 100,000 units per annum; 1½d. for the second 100,000 units per annum; and 1d. per unit for all over 200,000 units per annum.

A special meeting of the Greenock Corporation has decided against the proposal to purchase the undertaking of the Greenock & Port Glasgow Tramways Co.

According to the *Standard*, some officials of the Victorian Government Railway Department are coming to London to inspect the electric railway system.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Yesterday's *Times* made the interesting announcement that the Post Office are proposing to extend considerably the utilisation of automatic telephone exchanges. It will be remembered that the initial experiments were carried out on three exchanges, viz., G.P.O. (official switch), Epsom and Hereford. Now it is announced that ten additional exchanges are being equipped for automatic working, and that some will actually be in operation in the course of a few months. The largest of these will be at Leeds, which will be equipped on the Strowger system for 6,800 lines. A 5,000-line automatic exchange is to be equipped at Portsmouth, and the remaining exchanges on the automatic system will be Newport (1,800 lines), Accrington, Darlington, Stockport, Grimsby and Paisley (about 1,000 lines each), Dudley (500 lines), and Chepstow (65 lines).

The petition for extension of life of F. Ritchie's patent No. 24,048/99, which is the chief patent dealing with the telewriter, came on for hearing yesterday before Mr. Justice Warrington, and is still proceeding as we go to press. The petition is brought by the National Telewriter Co., Ltd.

The second of the series of Advanced Lectures on Wireless Telegraphy which Mr. J. St. Vincent Pletts, A.C.G.I. (Chief of the Patents Department, Marconi's Wireless Telegraph Co., Ltd.), is giving at the City and Guilds (Engineering) College, was delivered on Thursday evening last. Mr. Pletts briefly dealt with the early work of Hertz, Branly and Marconi. Nobody quite knows, he said, why such a great benefit is derived from earthing one pole of the Hertz oscillator and elevating the other. Although this allows the wave-length of the oscillator to be increased, yet this would not account for all the advantages obtained. The coherer was originally placed near the spark gap, but it was very liable to damage and had to be protected by an earthed shield. These coherers were very sensitive, and as the resistance varied from about infinity to 30,000 or 40,000 ohms, to obtain maximum sensitiveness the relays should have been wound for the latter figure. There are, however, a number of disadvantages with the simple aerial. Hertz showed that the energy lost per oscillation was  $16\pi^2 Q^2 / 2 \div 3\lambda^3$ , whence Fleming has shown that the rate of loss of energy =  $16\pi^2 l^2 KE \div 3\lambda^3 T$ , and  $E = E_0 e^{-2\pi l / \lambda T}$  where  $E$  = energy in the aerial at any time,  $E_0$  the original energy, and  $\delta = 16\pi^2 l^2 K \div 3\lambda^3$ , which is the radiation decrement. To obtain the total decrement the resistance decrement should be added, but in practice with the Marconi aerial this does not amount to more than one-tenth of the radiation decrement. If it is assumed that the potential is the same throughout the aerial, the capacity is given by  $K = l \div 2 \log. l/r$ , where  $l$  is the length of the aerial, and  $r$  the radius of the wire. Owing to the actual distribution of potential, however, the capacity appears to have  $2/\pi$  times this value, so that the decrement may be written,  $\delta = 16\pi^2 l^3 \div 3\lambda^3 \log. l/r$ . With the Marconi aerial as the wave-length  $\lambda$  is four times

the effective length of the aerial,  $\delta$  may be taken as  $2/6 \div \log. l/r$  approximately; also as the increase in the capacity of the aerial due to the earth is about 10 per cent., it is not far wrong to take  $\delta$  as  $8 \div \log. l/r$ . The useful oscillations of the aerial (that is, until the oscillations have been reduced to one-hundredth of their original value) =  $(4/6 + \delta) \div \delta$ . Mr. Pletts then dealt with the remarkable variations in the maximum distance, which could be overcome with the same equipment. It had been noticed that not only does the transmission distance vary greatly between day and night, but also from day to day and from hour to hour. Once or twice ships in the Atlantic have been able to communicate over a distance of 1,100 miles with an equipment of only 200 watts capacity. The equipment at Clifden and Glace Bay is of 220 kw. capacity, giving 160 kw. in the aerials, although only about 120 kw. are generally employed. There have been occasions, however, when readable signals have been transmitted with only one-thirtieth of this power. Dr. Eccles has advanced the theory that owing to ionisation of the upper layers of the atmosphere this acts as a reflecting surface, and so keeps the waves on the surface of the earth. It is easy to see that if this surface is not smooth but crumpled, as it may well be with changing atmospheric conditions, abnormal effects may be obtained. Since atmospheric effects may be a thousand times as strong as the signals themselves, they cannot be eliminated by any process of tuning, as they set the aerial oscillating in its own period. However, by the use of musical notes it is easy to distinguish the actual signals. To explain the propagation of the waves, Mr. Pletts resorted to an analogy which he had developed many years ago. A downward stream of water spreads out over a plane at right angles; if this plane is imagined to be porous the equivalent of the absorption found in practice is obtained. Professor Austin (United States Wireless Telegraph Department) has also given a similar formula,

$$C_R = (AC_r h_1 h_2 e^{-\alpha x / \sqrt{\lambda}}) \div \lambda x$$

where  $C_R$  = the current in the receiving aerial,  $C$ , the current in the sending aerial,  $h_1$  and  $h_2$ , the heights of the aerials in metres.  $A$  comes to about 0.00425, and the absorption constant (over water),  $\alpha$ , about 0.0475. This value, however, is not true if  $\lambda$  is greater than two miles. It is then found that more accurate results are given if the  $2/\sqrt{\lambda}$  is used. It has not been found possible to obtain an absorption constant for transmission over land. The next lecture will be given to-day at 5 p.m., and will deal with coupling; double waves; transmitting circuits; low frequency tuning and disc dischargers.

Experiments extending over a year on the relative intensity of received wireless signals have been made between the German Norddeich station and a receiving station 260 miles distant. The results are described by Herr H. Mosler in the *Elektrotechnische Zeitschrift*, No. 35, 1913. The strength of the signals was measured by means of a mirror galvanometer and a resistance connected in parallel with the receiving telephone. A 60-ft. aerial and a crystal detector were employed. No appreciable variation in the strength of the signals was observed during the day at any time of the year, the intensity being apparently uninfluenced by the height of the sun. On the other hand, the signals at night during the spring and autumn were double the strength of those by day. In the summer months the night signals were not much stronger than those by day. The intensity of the signals was not influenced by variations in temperature, pressure, or moisture of the air. On some winter nights, with a clear sky, the strength of the signals fluctuated up to six or eight times the average value within a few minutes at quite irregular intervals. Moonlight was found to have no appreciable influence on the strength of the signals. The variations are put down by the author to periodic fluctuations in the conductivity and reflective properties of the upper ionised layer of the atmosphere, which is some fifty miles high, according to the latest theories. This is confirmed by the observation of Taylor that the night signals are particularly strong during the "Northern Lights," which are at a maximum in the spring and autumn.

The Oran-Tangier cable was repaired on the 11th inst., and on the 12th inst. the Compagnie Française des Câbles Télégraphiques suffered a further interruption, the Martinique-Paramaribo cable having joined its brothers on strike. They have now four sections in West Indian waters down.—Besides this, the Jamaica-Colon cable has been down for a long time.—The Kartal-Nagra cable was down on the 15th inst.—The Greek office states that international telegrams can again be accepted for Samos, but at sender's risk.—Messages are sent as far as Smyra by telegraph and beyond by wireless without extra charge.

## The "Bridge-Megger" Testing Set

combines in one instrument many advantages. It has an immense range, and provides means for testing insulation by direct deflection with a

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 657. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

W.C.) a brochure describing Oerlikon generators, built for **SLOW-SPEED GENERATOR**.—We have received from the Maschinenfabrik Oerlikon (Oswaldstre House, Norfolk Street, coupling to Diesel engines, gas engines, &c., the magnet wheel of which revolves round the stationary armature instead, as is the case with ordinary flywheel-type generators, in the bore of the latter, the object being that of increasing the flywheel effect for a given weight of the rotary part in proportion to the square of the increased mean diameter of the rotor.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**ELECTRIC IMMERSION HEATERS, CARPETS, &c.**—Some neat little immersion heaters for heating small quantities of liquid, from  $\frac{1}{4}$  pint to  $\frac{1}{2}$  gallon, are described in a leaflet from Landau & Co. (St. Ann's Chambers, Orchard Street, Westminster, S.W.). The heater is known as the "Lanco," and is made of plated brass and wound for pressures between 100 and 220 volts. The usual size takes about 440 watts, and will boil a quart of water in about fifteen minutes, but a larger size taking 660 watts, is also obtainable. One design is adapted for pressures between 100 and 130 volts, or 200 and 230 volts, so that it is suitable for travellers' use. Another "Lanco" speciality consists of an electric heating cushion fitted with neat rotary heat regulator, by means of which three heats may be obtained. The cushion measures 12 in. by 15 in., and weighs 14 oz. It makes a convenient bed warmer, but may be used for many other purposes as well. Foot-mats and rugs in different materials and sizes may also be obtained for use where a supplementary local floor heating is desirable.

### A LARGE CABLE ORDER

**T**HE contract for the supply and erection of the cables for the conversion of their suburban lines to electric traction was placed by the London & South Western Railway Co.

FIG. 1.—11,000-VOLT 3-CORE CABLE FOR L. & S.W. RAILWAY.

with Siemens Brothers & Co., Ltd. (Woolwich). The leading particulars are as follows:—The three-phase current has a working pressure of 11,000 volts at a frequency of 25 cycles per sec. The generating station is

to be at Wimbledon, and sub-stations containing transformers and rotary-converters are to be erected at Waterloo, Clapham Junction, Raynes Park, Hampton Court Junction, Barnes, Twickenham, Isleworth, Sunbury and Kingston. The cables (see Fig. 1) are three-core, paper-insulated, lead-covered, jute-served and armoured with a layer of galvanised

FIG. 2.—THE FIRST BATCH OF CABLE READY FOR DELIVERY.

steel wires, and served all over with jute. The approximate quantities of three-core cable to be used are as follows:—84 miles 0.2 sq. in., 21½ miles 0.15 sq. in., and 19 miles 0.06 sq. in. The chief particulars of the cables are as follows:—

Section.	No. of Wires.	Diameter of Wire varying from	Thickness of Dielectric between Conductors and Lead.	Thickness of Lead.	Overall Diameter of Cable.
Sq. in.			inches.	inches.	inches.
0.2	33	0.06 to 0.114	0.36	0.16	3.17
0.15	33	0.054 to 0.11	0.36	0.15	3.01
0.06	22	0.048 to 0.068	0.35	0.13	2.65

The cables are being erected on brackets supported by stakes driven into the ground. They were subjected to a test pressure of 25,000 volts between any core and lead. The work is being carried out under the superintendence of Mr. Herbert Jones, Chief Electrical Engineer to the London & South Western Railway Co. Fig. 2 illustrates the first batch of finished cable before despatch from Woolwich Works.

### "REDGLO" ELECTRIC FIRES

**REDGLO, LTD.** (Royal Liver Building, Liverpool), have brought out some attractive designs incorporating their electric fire unit. As it is well known, this consists of a heating element covered by a quartz bowl through which the heat passes. It attains a glowing red surface within a few moments of the current being switched on, and gives a particularly large heating area for its current consumption. The heating surface of each unit is 28 sq. in., and the current consumption is 600 watts. Thus in places where the charge of electricity is 1d. per unit, the cost for one hour is only a trifle over  $\frac{1}{4}$ d. The object which has been aimed at is the conversion of the maximum amount of electrical energy into radiant heat. The losses due to convected heat which are losses when the aim is radiant heat have been reduced to a minimum. A large number of designs have been got out to suit all requirements, and in some of the frames two or three units are incorporated for use where great heat is required.

The single unit designs should prove a great attraction to retail establishments, owing to their reasonable cost and the fact that such a short time is taken to attain their maximum temperature.

### A 1295 TO 1 REDUCING GEAR

THE illustration shows one of a number of special reducing gears designed by The India Rubber, Gutta Percha and Telegraph Works Co., Ltd. (Silvertown), to operate the damper of a bank of boilers. The reducing gear consists of a combination of bevel and epicyclic spur gearing which rotates a vertical shaft. A crank is fitted to the lower end of the shaft which operates two connecting rods attached to the cranks on the damper. The gear ratio is 1295:1. The

SILVERTOWN MOTOR DRIVING REDUCING GEAR.

motor is of the Silvertown "Z.15" type, and develops 1½ B.H.P. at 1,295 r.p.m. The chain wheel fitted on top of the gear serves to drive an indicator erected in the stoke-hole, thus the stoker can see at a glance the exact position of the damper. As the motor and gear are installed over the boiler flue, a metal cover is fitted over the complete gear to exclude dust as far as possible. We would draw attention to the fact that the arrangement of the gear renders it impossible for the dampers to jam when closed, should the motor be allowed to over-run.

### ILLUMINATED DECORATIONS

AN attractive series of electrical illumination devices for Christmas and festive decorations is included in a new list from Siemens Bros. Dynamo Works, Ltd. (Lamp and Fittings Department).

ILLUMINATED FRUIT BASKET.

In one of these, the basket illustrated here, the coloured lamp bulbs are moulded to represent fruit, and in another a basket of roses is similarly imitated. There are also a number of single lamp designs representing oak sprays, poppies, pears, geraniums and hyacinths. The baskets are obtainable ready wired for the usual supply voltages, and the single lamp devices are provided with 15-volt lamps, which can be run in series with the baskets. The devices are strongly made, and of quite natural colours and shapes, the floral and other designs are specially suitable for

table decorations, and lend considerably to the effectiveness of the festive board. Illumination lamps of many varied shapes are available for use on Christmas tree decoration, and include representations of fruit, flowers and birds. All these types can be obtained with clip contacts, which simplifies wiring, and a selection of these devices may be interconnected to complete any required decoration scheme. Copies of this list will be supplied to any member of the trade who may be interested.

**Lundberg Switching Competition.**—We are asked to state that amongst the Preliminary Grade Certificate holders "P. Riach (Birmingham)" should have appeared as "P. Riach (London)." The error was not ours.

### INDIRECT LIGHTING

THE British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), have just issued a twenty-four page booklet on the "Eye-Rest" system. This booklet describes the system, and illustrates and prices the complete range of "Eye-Rest" fittings. Amongst the many new designs shown in this booklet are some flambeaux pendants and wall brackets with X-ray reflectors concealed in the flambeaux, as illustrated in Figs. 1 and 2. A number

FIG. 1.—EYE-REST FLAMBEAU FITTING.

FIG. 2.—FLAMBEAU WALL BRACKET.

of illustrations of typical installations are included in the booklet. Electrical engineers and contractors should write for copies.

An interesting article on indirect lighting appeared recently in the *Standard*, where the excellent diffusion obtained by this method was emphasised, and the well-known effect of increasing the apparent height of the room commented on. Another advantage pointed out is the absence of unpleasant

FIG. 3.—ASSEMBLY ROOM, SOCIETY OF ARCHITECTS, BEDFORD SQUARE, LONDON.

glare from glossy paper when reading. The system is truly named "Eye-rest," as compared with some of the crude methods of illumination by "lumps of light" hitherto practised. A good example of an interior lighted by this method is shown in Fig. 3.

**A Social Gathering.**—A. Reyrolle & Co.'s employees held their annual whist drive and dance in the Hebburn Co-operative Hall on Friday last. The event was very successful. After supper, prizes for the works' annual sports were presented by Mrs. Reyrolle, who received a handsome bouquet. Mr. H. C. Stuart, of the purchasing department, then moved a vote of thanks, and referred to the cordial relations between the officials and workmen, and the genuine interest taken in the welfare of the employees by the head of the firm. This vote was seconded by Mr. P. Wright, of the switch department, after which Mr. Reyrolle replied. An enjoyable programme of dancing followed. The success of the function was largely due to the work of the hon. secretary and his committee.

*When corresponding with Advertisers, please mention "Electrical Engineering."*

### AN ARTISTIC ADVERTISEMENT

THROUGH the kindness of Siemens Bros. Dynamo Works, Ltd. (Lamp Department), we are able to adorn our office wall with the handsome coloured picture which we reproduce here showing a Wotan lamp in very charming company and surroundings. The firm are being very liberal with their good

things, and offer to present copies of this picture ready for framing to any electric light consumer who would care to have one. The supply is, of course, limited, and in view of the huge peak that the maximum demand is expected to attain, the priority will be given to consumers who are using lamps of Siemens' manufacture. The offer is, however, open to anyone who has electricity installed.

### SOLID RUBBER-SHEATHED CABLES

WE have recently received a list from W. T. Henley's Telegraph Works Co., Ltd. (Blomfield Street, London Wall, E.C.), dealing with solid rubber sheathed cables, which are now widely used where there is a liability of meeting with mechanical damage. The conditions under which trailing cables are used in mines, on wharves and docks in connection with portable apparatus, cranes, &c., are, in most cases, exceptionally severe, and call for cables which must be specially protected to give satisfactory results. Also in workshops, factories and mills there is a probability of the ordinary lighting cables and flexible cords being accidentally knocked

FOUR-CORE RUBBER SHEATHED CABLE.

or struck by some sharp material. The sheathing consists of vulcanised india-rubber of a tough and durable quality, specially prepared to withstand the effects of rough usage. Although the initial cost of this type is greater than those types which have been previously installed, it is more economical in the end, owing to the fact that the life of solid rubber sheathed cables in such circumstances is longer than that of the ordinary pattern. The illustration gives a good idea of the nature of the cable. One layer of pure rubber and two layers of vulcanising rubber are used for the actual insulation of the conductors, all is then vulcanised together and sheathed with a vulcanised rubber of a special

tough and durable quality. Single and twin ordinary cables are made in this way as well as 2, 3 or 4 core special trailing cables, and "C.M.A." flexibles with this class of protection. The firm will be glad to send a copy of the list to anyone in the trade who is interested in the matter.

### TELEPHONE SWITCHBOARDS

THE Peel-Conner Telephone Works, Ltd., have issued a Bulletin describing their central battery multiple switchboards. It contains a description of their system of telephone exchange equipment, bringing out clearly the points which should appeal to the telephone engineer. Although the book contains some fine photographs of the exchange switchboards in use in various places, the descriptive matter is not subordinated to the illustrations, and the latter are for the most part excellent reproductions, showing in detail the various pieces of apparatus used in a telephone exchange on the Peel-Conner system. The Company is proud of its relays, and guarantees that the relay faults in their exchanges per year are less than one-tenth of one per cent. of the number of relays installed. A feature of the Peel-Conner system, it will be remembered, is that the central battery is fed to the lines through relay windings which operate the supervisory signals as well as serving as impedance coils, and the voice currents pass from one side of the cord circuit to the other through a condenser. Although the Company make exchanges for 22-volt working as well as for 40-volt central batteries, they recommend the latter in most cases.

### LIFTING MAGNETS IN STEEL WORKS

THE great field of utility for lifting magnets in steel works is rarely realised except by those who are brought directly into contact with such work. In an important works thousands of tons of scrap rapidly accumulate, making it extremely difficult for human labour to cope with the large amount of material. Seeing that the accumulation of scrap was getting out of hand, one of the largest steelworks in the country decided to resort to lifting magnets for its

WITTON-KRAMER MAGNET LOADING SCRAP IN A STEEL WORKS.

removal, and some idea of the work to be performed by the magnet can be gathered from the mountains of turnings and other scrap that lie on either side of the rails, after gathering for several decades. The magnet, which was supplied by the Witton Kramer Electric Tool & Hoist Co. (for whom the General Electric Co., 67 Queen Victoria Street, London, E.C., are the sole selling agents), is 42 in. in diameter, and, as will be observed from the illustration, is suspended from a jib crane. From the latest reports the magnet is making great headway in the collection of scrap.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Australia.**—The Sydney Council is seeking authority to borrow £250,000 for the general purposes of the electricity undertaking.

**Basingstoke.**—A Local Government Board inquiry will be held shortly concerning a loan of £14,000 for the Council's electric lighting scheme.

**Birkenhead.**—Twelve months' supply of motors and motor starters from  $\frac{1}{2}$  h.p. to 15 h.p. Borough Electrical Engineer. (See advertisement on another page.)

**Bradford.**—A Local Government Board inquiry was held on Friday concerning a loan of £90,000 for plant extensions at the Valley Road works. The chief need for this expenditure, it was explained to the inspector, is from the increased applications for power purposes in textile works.

**Cornwall.**—The Great Treverbyn China Clay Co. proposes to erect a power station. Particulars from Cowell & Cowell, Central Chambers, Newquay.

**Hereford.**—A loan of £1,000, repayable in 25 years, has been sanctioned by the L.G.B. for services.

**London: Hackney.**—A loan of £56,748 has been sanctioned by the L.C.C. for electrical extensions.

**Shoreditch.**—Transformer and converting plant for sub-station. Borough Electrical Engineer. December 16th. (See advertisement on another page.)

**St. Marylebone.**—The Finance Committee of the L.C.C. recommends sanction to a loan of £10,825 for electrical extensions.

**Loughborough.**—In reporting upon the proposed loan of £14,000 for re-arrangement of the electricity undertaking and change of supply from direct current to alternating current, the Local Government Board has informed the Corporation that it will defer sanction until the approval of the Board of Trade to the new system of supply has been obtained. This loan is in connection with the installation of a Ljungstrom turbo-alternator, about which Mr. H. R. Hooper, the Local Government Board Inspector, expressed himself rather freely at the time of the inquiry.

**New Zealand.**—An extensive electric pumping plant is to be installed in the Otago Province for rendering some 6,000 acres suitable for fruit growing and similar purposes. Further particulars, Board of Trade, 78 Basinghall Street, London, E.C.

The Fielding Council proposes to borrow £10,000 for an electric lighting undertaking.

**Plymouth.**—H.T. switch panels are required for the electricity works. Borough Electrical Engineer. December 1st.

**Radcliffe.**—A loan of £3,950 is to be taken up for electrical extensions.

**South Africa.**—The East London Council proposes to raise a loan of £18,000 for mains extensions, and £16,270 for plant extensions.—The Cape Province Council is raising a loan of £7,000 for electrical purposes.

**Wallasey.**—A Local Government Board inquiry was held on Tuesday concerning a loan of £65,000 for extensions at the electricity works. It is proposed to construct a new generating station at Seacombe.

**Wolverhampton.**—The Local Government Board has sanctioned the borrowing of £15,000 for mains, £5,000 for station equipment, and £2,000 for switchgear.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Bannockburn.**—The Co-operative Society's premises are to be equipped with an electric lighting and power installation, current being supplied by the Scottish Central Electric Power Co.

**Barry.**—Rebuilding of Boys' County School, recently destroyed by fire. Clerk, Glamorgan County Hall, Cardiff.

**Beckenham.**—The necessary loans have been sanctioned for an elementary school in Balgovan Road.

**Blackpool.**—Public baths and wash-houses (£10,000).

**Dewsbury.**—Electric lighting of Dewsbury Pioneers' Industrial Society. Architects, Holton & Fox, Corporation Street.

**Finchley.**—New swimming bath.

**Grimby.**—Bank premises, Victoria Street. Architects, Garside & Pennington, Old Bank Chambers, Pontefract.

**Huddersfield.**—The electric lighting of the Crosland Moor workhouse has been decided upon.

**Liverpool.**—Drill hall for West Lancashire Territorial Force Association. Secretary, 21 Islington, Liverpool.

**London: L.C.C.**—225 points at Chester Road elementary school, St. Pancras. (See advertisement on another page.)

Enlargement of Ennersdale School, Lewisham (£5,360).

**Manchester.**—Additions to Dispensary and Ophthalmic Department at West Didsbury workhouse. Architect, F. H. Overmann, 49 King Street.

Alterations to Labour Exchange and Health Insurance Offices, 30 Dickinson Street. H.M. Office of Works, London.

**Pontefract.**—Nurses' Home at workhouse. Clerk to Guardians. December 2nd.

**Pontypridd.**—Tenders are invited for the electric lighting of the Cottage Homes, Church Village. Clerk to Guardians, November 25th.

**Stalybridge.**—New swimming bath. Borough Surveyor.

## TENDERS RECEIVED AND ACCEPTED

**Barnsley.**—The Electricity Department has placed a repeat order with Edward Bennis & Co. for four "Bennis" machine-stokers and self-cleaning compressed-air furnaces.

**Loughborough.**—Subject to the consent of the Local Government Board (see "Tenders Invited" columns) the following contracts have been signed for plant extensions:—Ljungstrom turbo-alternator, Brush Electrical Engineering Co.; rotary-converter and switchgear, Siemens Bros. & Co

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £70 10s. to £71 10s. (Last week, £73 to £73 10s.)

**Agencies Wanted.**—A firm of electrical and general engineers in Sydney, N.S.W., desires to take up a few agencies for switchgear, instruments or any special electrical apparatus for firms not already represented in Australia. Firms desiring to be put into communication with this firm may apply to the Editor of ELECTRICAL ENGINEERING for its name and address.

An American manufacturer desires agents in Great Britain for electrical vacuum cleaners, &c. (See advertisement on another page.)

**Liquidations.**—A meeting of the creditors of Metalite, Ltd., now being wound up voluntarily with a view to reconstruction, will be held at 9 and 10 Pancras Lane, E.C., on Monday, the 24th inst., at 12 noon.

The Hydro Electrical Gear Co., Ltd., is to be wound up voluntarily, with Mr. J. A. Henderson, of 11 Pancras Lane, E.C., as liquidator. A meeting of creditors will be held at the above address to-day at 11 a.m.

A meeting of the creditors of the Preston Electric Co., Ltd., was held at the office of the liquidator, Mr. T. L. Rawlins, 12 Bennets Hill, Birmingham.

With reference to the notice on page 638 of last week's ELECTRICAL ENGINEERING, regarding the winding up of Ozonair, Ltd., it should be stated that this voluntary liquidation is with a view to the sale of the business to a new company, which has already received its certificate of incorporation and permission to trade.

**Fire Brigade Competition.**—The Brigade of the General Electric Co., Ltd., participated in the annual competition of the Associated Fire Brigades on the drill ground of Achilles Serre, Ltd., Hackney Wick. In this case they were not successful in carrying off the prizes, as they often have done, but the honours went to their hosts.

**STEAM JOINTS**  
USE

JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.

## LOCAL NOTES

**Bristol: Workhouse Lighting.**—At the last meeting of the Guardians reference was made to the satisfactory results of the electric lighting installation at the Stapleton workhouse, and the beneficial effect upon the decorations compared with what was the case when the buildings were previously lighted by gas.

**Bath: Diesel Engine.**—The official tests of the Diesel engine have now been carried out with satisfactory results.

**Consett: Electric Lighting.**—The Cleveland & Durham Electric Power Co., having given an undertaking that they will definitely inaugurate public electric lighting this month, notice is to be given to the Shotley Bridge & Consett District Gas Co. to cease lighting the street lamps.

**Dudley: Electricity Supply.**—Although it was said to be the intention of the Power Co., which has acquired the Dudley Corporation electricity works, to convert the power station into a sub-station, information has now been received which goes to show that the Company has now changed its plans, and that the Dudley Works will be extended and continued in use as a generating station.

**Edinburgh: Extension of Area.**—The Town Council has decided to apply for an electric lighting provisional order to deal with some half-dozen suburban districts outside the present area of supply.

**Hove: Purchase of Electricity Co.**—It is anticipated that the total cost to the Corporation of the purchase of the Hove Electric Lighting Co., Ltd., will be £175,000. The transfer is to take place on December 8th, but apparently as yet the Corporation has not come to a decision whether to work the undertaking itself or to lease it.

**Hebburn: The Cable Breakdowns.**—According to the *North Mail*, Prof. Thornton's report on the recent cable troubles attributes the failures of the 240-volt continuous-current cables to the effect of moisture forced by the osmotic effect of the continuous current into cracks in the bitumen. The Supply Co. is now changing to A.C. supply, which is expected to rectify the trouble, as has been the case at Monkseaton and other places. The high-pressure cables are reported to be in good order.

**Leeds: Electric Lighting Accounts.**—The expansion of the business of the electric supply undertaking, which has been noticeable during the past few years, has proceeded without any falling off during the past half year. The growth of the power supply is beyond all precedent, there being an increase in output for this of 37·57 per cent. over the first half 1912-13, with an increase in the horse power of motors connected of 10·74 per cent. The increase in private lighting has more than neutralised the loss in price consequent upon the reduced tariff which took effect in October, 1912. The total sales for the half year, viz., 12,858,263 units, show an increase of 33·54 per cent over the corresponding period for 1912-13, and the total income, viz., £52,828, is 19 per cent. in advance. The average price obtained has been reduced from 1·15d. per unit to 1·02d. per unit.

**Lytham: Electricity Supply.**—With reference to the proposal of the Council to proceed with an electric lighting scheme of its own (*ELECTRICAL ENGINEERING*, November 13th, p. 633), Mr. J. H. Tonge, Engineer and Manager, National Electric Supply Co., Ltd., Preston, has reported to the Council that with an estimated output of 180,000 units per annum, and the maximum load of 180 kw., the cost of supply from the St. Anne's Council's electricity works delivered to the Council's low-pressure feeders will be 3·35d., whilst he estimates that the Lytham Council could, with its own plant, generate at 2·93d. per unit, the capital charges for distribution being the same in either case. It is in consequence of this difference in price and the fact that the St. Anne's Council requires a contract for twenty-one years, that the Electric Lighting Committee has recommended the Council to proceed with its own scheme.

**Loughborough: Electricity Committee.**—Hitherto the electricity and gas undertakings have been managed by one committee, but at the first meeting of the new Town Council after the November elections it was decided to have these undertakings in future managed by separate committees.

**Newcastle-under-Lyme: Cooking Demonstrations.**—A series of electric cooking demonstrations is being held by Mr. F. S. Grogan, of the British Electric Transformer Co., Ltd., who are the makers of "Tricity" cookers. The demonstrations were arranged for by Messrs. Gillespie & Beales (Amberley House, Norfolk Street, Strand), who are sole wholesale agents for these cookers, in co-operation with Mr. A. J. C. de Renzi, Borough Electrical Engineer.

**Rushden: Electric Supply.**—The power house recently erected by the Rushden & District Electric Supply Co., which got into working order about a month ago, contains two Diesel oil-engine driven generating sets of 240 kw. each.

**Sunderland: Reduced Heating Tariff.**—The Electricity Committee recommends that the tariff for heating and cooking where the premises are lighted throughout by electricity be reduced from ½d. to ¼d. per unit.

**Teignmouth: Electric Supply.**—The consideration of Mr. E. M. Lacey's report upon an electric lighting scheme (*ELECTRICAL ENGINEERING*, November 6th, p. 623) has been deferred for a month.

**Troon: Electric Supply.**—Negotiations are being carried on with the Kilmarnock Corporation for a supply of electricity to be given in this district. It has been estimated that an independent plant could be put down at £5,000, but an endeavour is being made to obtain a supply at about ½d. per unit from Kilmarnock.

**Weston-super-Mare: Street Lighting.**—The Weston-super-Mare & District Electric Supply Co., Ltd., has placed a scheme before the Council for installing centrally suspended arc lamps along the Boulevard to give a candle power of not less than 3,600, at a cost of £42 per annum on a five years' contract. The offer has been accepted. The penalty for non-maintenance of candle power is to be 5s. per night upon the figures ascertained by the Borough Surveyor.

## APPOINTMENTS AND PERSONAL NOTES

Mr. J. E. Pownall, of Hampstead, has been appointed Assistant Electrical Engineer at Tunbridge Wells, at a salary of £170 rising to £200 per annum, in succession to Mr. J. Bemrose, who has been appointed Chief Electrical Engineer at Leek.

We are glad to report that Mr. H. Clifford Palmer, Manager of the Publication Department of the General Electric Co., who met with an accident when motor-bicycling about a month ago and seriously damaged his leg just below the knee-cap, is now practically well again.

A mains inspector is required in the London County Council Tramways Department. Salary £3 10s. per week. (See advertisement on another page.)

Two switchboard attendants are required in the Birkenhead Corporation Electricity Department. (See advertisement on another page.)

Mr. R. J. Wright has been appointed Charge Engineer at the Hereford Corporation electricity works.

## NEW COMPANIES

**ENFIELD ELECTRIC CABLE MANUFACTURING CO., LTD.**, 47 New Broad Street, E.C. Capital £50,000.

**CUMBERLAND WASTE HEAT OWNERS CO., LTD.**—Registered by Kerr & Lanham, 16 Farnival Street, E.C. Capital £50,000. To undertake schemes for the production of electrical energy from waste heat. First directors, L. Wood and C. S. Hunting.

**Southend Yacht Club "Tricity" Dinner.**—Messrs. Gillespie & Beales, the sole wholesale agents for "Tricity" electric cookers, recently arranged to cook a dinner for forty of the club members at the request of Mr. Birkett, the Borough Electrical Engineer of Southend. The members were very extravagant in their praise of the results. The proceedings terminated with a joint toast to Mr. Birkett, and to Mr. Grogan, of the British Electric Transformer Co., Ltd., which was duly replied to.

**Velveduct.**—It would on first consideration appear improbable that anything novel in the shape of a conduit tube was capable of being produced. After continued experiment, however, the General Electric Co., Ltd., are able to put on the market a drawn tube, similar in quality and appearance to solid drawn or seamless conduit, but at a price very little higher than welded or brazed tube. The chief points of superiority which have maintained the employment of the higher-priced seamless conduit have been the facility with which it could be bent or set cold, and the freedom from internal fins and burrs, such as are sometimes found in the cheaper tubes. The processes employed in the production of "Velveduct" entirely prevent the possibility of the tube having any internal irregularities, and it can be set cold with equal facility to the seamless tube. "Velveduct" is stocked both in the standard electric thread and also gas thread, and can be used with all the varieties of screwed accessories illustrated in the Conduit Catalogue issued by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.).

## SUMMARY

SOME handsome new street lamp standards have been erected in Marylebone. (Page 660.)

THE electricity supply scheme at Calcutta has recently been reorganised, and a large three-phase station at Cossipore now gives the supply through a number of sub-stations. (Page 661.)

In a Paper read last night at the Birmingham Local Section, and to be discussed to-night at the London meeting of the Institution of Electrical Engineers, Mr. S. Evershed detailed the results of a research showing how important a part absorbed moisture plays in insulation resistance. (Page 663.)

A BADLY designed hand-lamp, and an installation connected so that a 440-volt shock could be obtained from the lighting circuit, were the subject of a Home Office prosecution at Birmingham. A heavy fine was imposed. (Page 663.)

THE connections of petrol-electric cars are discussed in our Questions and Answers columns. (Page 664.)

ABOUT 70 to 100 students broke into the Albert Hall sub-station of the Kensington and Knightsbridge Electric Lighting Co. on Wednesday last week, with the intention of switching off the light in the Albert Hall during James Larkin's meeting. Although some damage was done, their object was not accomplished. (Page 665.)

THE life of the chief of the patents covering the telewriter, as now in use, has been extended five years. Among the specifications published on Thursday last

by the Patent Office is one for maintaining constant the frequency of an A.C. circuit supplied by an inverted rotary. The patentees are the B. T.-H. Co., E. Garton, and A. H. Watson. A disc discharger to give oscillations of a high group frequency suitable for wireless telephony, is described by F. Majorana. (Page 666.)

MAJOR PRINGLE's report on the Aisgill disaster insists on the necessity of superseding gas lighting on trains by electric lighting, and makes some suggestions with regard to automatic stop signalling.—The North-Eastern Railway Co. proposes to use trolley omnibuses for conveying passengers and goods between their stations in Newcastle and Gateshead.—A double-deck trolley omnibus has been approved by the Board of Trade for Brighton.—Good progress is being made with the electrification of the London & North-Western suburban lines. (Page 667.)

DURING the successful hearing of the application for extension of the chief telewriter patent, the progress of the National Telewriter Co. was mentioned. Mr. J. St. V. Pletts gave some particulars as to the couplings used in wireless telegraph circuits, and demonstrated the oscillation of energy from one circuit to the other by means of a mechanical analogy in a lecture last week. The Wireless Society of London has a large number of members, and has now drawn up a set of rules. (Page 667.)

FOOL-PROOF motor control panels for constant and variable speed motors are illustrated. An ingenious interlocking system employed is described. (Page 668.)

A COMPREHENSIVE, well-arranged new season's price-list, dealing with electrical supplies, has been produced by Drake & Gorham, Ltd. (Page 669.)

STREET lighting with ornamental lamp-posts, lowering gear for large electroliers, and a contractor's window display in Australia form the subjects of short illustrated articles on page 670.

A 5,000-kw. alternator is required at Dundee; a similar set, together with storage batteries and transforming plant at Bradford, and expenditures as follows are contemplated:—Stratford (£21,500); Stepney (£7,180); Neath (£9,536); Aylesbury (£20,800); and Rathmines (£12,500).—Electrically-driven pumps are required at Rotherham; motor-converters at Johannesburg, and it is proposed to convert to electric traction certain Cape Town suburban lines. (Page 671.)

THE L.B. & S.C. Railway Co. has agreed to take all supply for lighting and power in its Brighton workshops from the Corporation.—The Broughty Ferry power station is to be linked up with Dundee.—The cost of the recent breakdowns at the L.C.C. power station, including the cost of temporary supply from outside, was £1,713.—The Board of Trade has stipu-

lated that covers on switches, framework, and guards on electric cooking apparatus on the Marylebone supply system shall be sufficiently earthed.—The Hove Corporation, having taken over the electric lighting undertaking from the Hove Electric Lighting Co., are now ready to enter into arrangements for the sale or another lease of this profitable business. (Page 672.)

THE Local Government Board has informed the Association of Municipal Electrical Engineers (Greater London) that expenditure by local authorities on advertising literature is legal. (Page 672.)

A SCHEME for postponing the date of the purchase by the L.C.C. of the London electric supply companies is promised for the next session of Parliament, which may possibly involve an amalgamation of existing supply interests in London. (Page 672.)

### ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, NOVEMBER 27TH.

*Institution of Electrical Engineers.*

8 p.m. "The Characteristics of Insulation Resistance," by S. Evershed.

FRIDAY, NOVEMBER 28TH.

*Physical Society.*

5 p.m. At Imperial College of Science. The agenda includes an exhibition of a Double-Fibre String Galvanometer, by H. W. Aphorpe.

SATURDAY, NOVEMBER 29TH.

*Association of Mining Electrical Engineers.*

5.30 p.m. Warwickshire and S. Staffs Section. At Imperial Hotel, Birmingham. "Large Prime Movers and Boilers for Power Houses," by E. Kilburn Scott.

MONDAY, DECEMBER 1ST.

*Institution of Electrical Engineers: Western Section.*

5.45 p.m. At S. Wales Institute of Engineers, Park Place, Cardiff. "The Characteristics of Insulation Resistance," by S. Evershed.

SATURDAY, DECEMBER 6TH.—Headquarters open from 10 a.m. till noon.

**Obituary.**—We regret to announce the death of Mr. James Howden, in his eighty-second year, Chairman of Messrs. J. Howden & Co., makers of the Howden-Zoelly turbines.

**The Electrical Trades' Benevolent Institution.**—On Saturday evening last, friends and well-wishers of the Electrical Trades' Benevolent Institution gathered in force at the Royal Court Theatre, Sloane Square, to witness an excellent performance of Granville Barker's interesting play, "The Voysey Inheritance," by members of the Garrick Dramatic Society. The performance was well finished and noticeably free from that crudeness which one often associates with amateur efforts. The sharp contrasts between the characters of the different members of the Voysey family were very well brought out. An excellent study of the old man was made by Mr. George Quennel, and there was some fine acting in the arduous part of Edward Voysey by Mr. Clive Brook, while all the ladies, especially Miss Ethyl M. Jolley, acquitted themselves well.

### NEW STREET LAMPS IN MARYLEBONE

A DEPARTURE in street lighting has been made at the new Baker Street Circus, by Baker Street Station. Some handsome new four and five lamp columns on the American ornamental street-lighting system have been erected, each containing a total of 600 watts, in the case of the five-lamp brackets, made up of four 100 and one 200-watt lamps. The fittings were supplied by Mr. Haydn Harrison. The columns are the standard Metropolitan Board of Works type, slightly extended, the globes are Alba and Superlux, and the lamps Osram and Mazda. On the refuge and sidewalk are three lamp fittings, taking 400 watts per post.

Mr. A. H. Seabrook (General Manager, Marylebone Electric Supply Department) remarks in his characteristically outspoken way that this method of street lighting breaks nearly every rule of illumination, but it is contended that it gives

5-LAMP STANDARD AT BAKER STREET CIRCUS.

a most pleasing effect, and, if wasteful in current, a pleasing effect is of more importance from an advertising point of view than a correct system of illumination, which may possibly not be pleasing in appearance. The previous posts erected on this site were of two-light 160 watts, and three-light refuge type of 240-watt capacity, for which the Department charged £4 9s. 6d. and £6 14s. 6d. per post per annum. The charge for the new 600-watt posts is £14, and the 400-watt £10 per post per annum, so that over three times the light is being given for approximately twice the money. The final globes are not yet decided upon, and when this is done all the posts will be of 600-watt capacity. All that has been done is to calculate a small additional cost per unit for the current consumption, reckoning the turning on and off, annual maintenance, &c., the same as before, with the exception of a small increase in lamp maintenance.

**Wages of Electrical Workers.**—It is stated that the Electrical Trades Union has given notice to the London employers for an advance in wages to electrical wiremen to 11d. per hour. A special conference, it is stated, will be held of all the unions connected with the building industry in connection with this demand.

**An Electrically-driven Weaving Shed.**—We are informed by Messrs. John Emsley & Co. that the last paragraph but one in the description of "An Electrically-driven Weaving Shed," on page 645 of our issue last week, containing some figures with regard to the speeding-up, charges and capital expenditure, is incorrect.

## ELECTRICITY SUPPLY IN CALCUTTA

THE development of the undertaking of the Calcutta Electric Supply Corporation, culminating in the large power station now running at Cossipore, and its extensive distribution system, is an interesting example of engineering progress, and considering the large part that electric power is likely to play in the industries of India, involves a scheme in which the prosperity of that populous city is largely bound up.

The first movements towards centralised electricity supply in Calcutta were the passing of the Calcutta Electric Lighting Act of 1895 and the formation in 1897 of the Indian Electric Co., Ltd., reorganised later into the Calcutta Electric Supply Corporation, Ltd. This Company opened its first small generating station at Emambagh Lane in 1899. In 1902 a 750-kw. station was added at Alipore. Both these were continuous-current

ten acres, of which only a portion is yet built on, in the Cossipore-Chitpur municipality, with a frontage on the Hooghly River, and a siding connecting with the Eastern Bengal Railway. A building containing quarters for the engineering staff is provided on the river bank near by. A plan of the station is given in Fig. 1. The main generating plant consists of four 3,000-kw. turbo-alternators, one 800-kw. small turbo-generator, some continuous-current plant moved from the old stations, and one 475-kw. motor-converter. The 3,000-kw. sets are Oerlikon 6,600-volt 3-phase 50-cycle alternators driven by Oerlikon high-pressure steam turbines. Three formed the initial equipment, and a fourth one has just been delivered, but is not yet in commission. These alternators are ventilated by fans carried on their own shafts, and the air is at present drawn through dry filters. In view of the climatic conditions, special precautions have been taken with the insulation, and a complete spare stator is kept in readiness, interchangeable with that of any machine

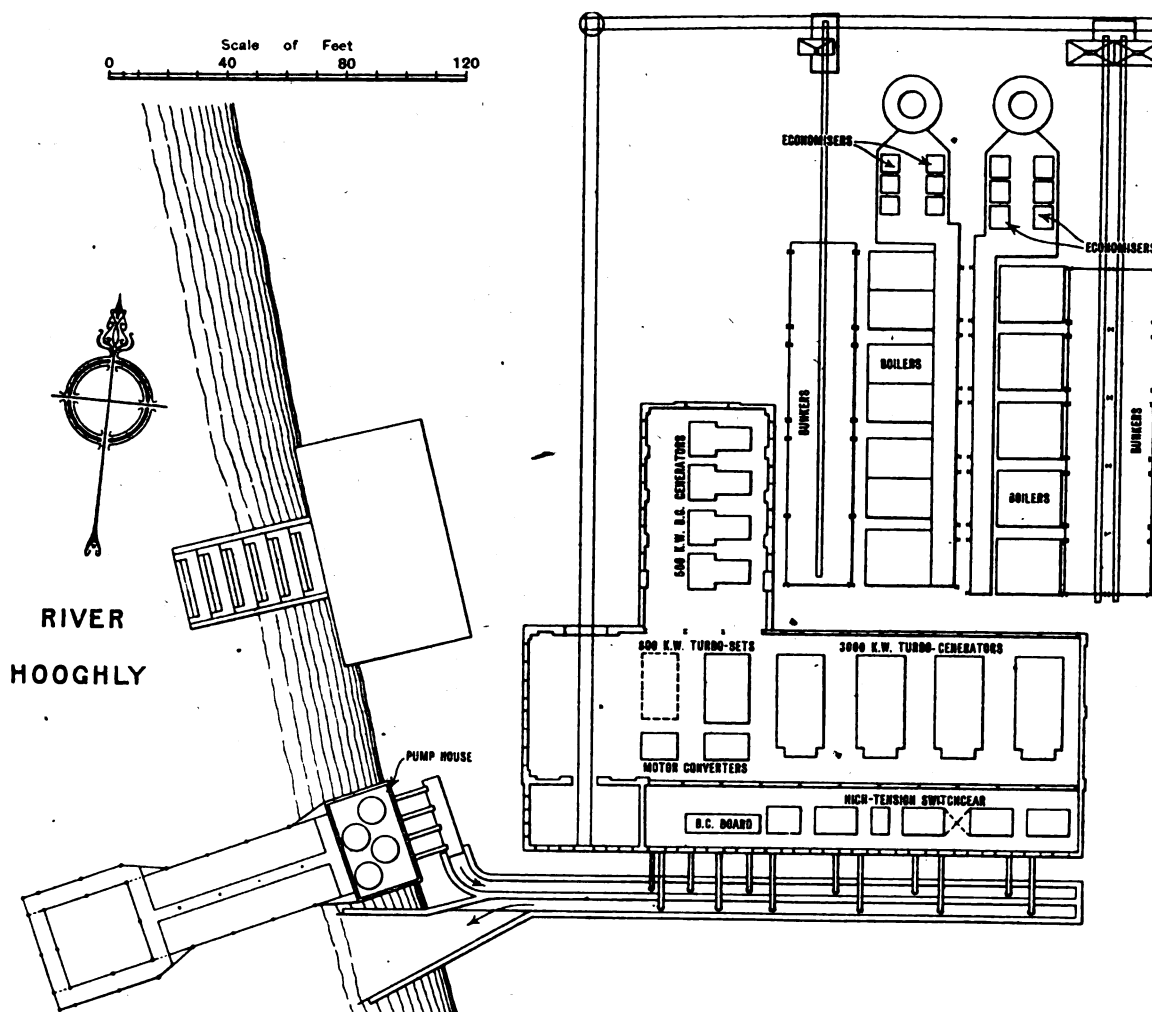

FIG. 1.—PLAN OF COSSIPORE GENERATING STATION.

stations, driven by high-speed reciprocating engines. In 1906 a suction gas station of 165 kw. was started at Howrah, and a further steam station of 1,200 kw. was built at Ultadanga. The load, however, increased so rapidly, that these stations became insufficient, and in 1909 Messrs. Kennedy & Jenkin were asked to report on the situation, and on their advice an 800-kw. 6,600-volt Willans-Siemens turbo-alternator was added at Ultadanga in 1910, marking the entry of alternating current into the system. This was, however, only a temporary measure, and the construction of a large new high-tension generating station at Cossipore, on the River Hooghly, where ample condensing facilities were available, and the conversion of the old stations into sub-stations was decided upon. Work was put in hand on this station—which it is our main object to describe here—in 1910; supply from it commenced in 1912, and the old stations were gradually closed down. It may be mentioned here that Mr. K. A. Scott-Moncrieff was Chief Engineer from the commencement till 1902, when he was succeeded by Mr. S. G. L. Eustace, who held the position till 1909, when the present Chief Engineer, Mr. R. E. Winkfield, was appointed.

The site acquired for the Cossipore station comprises about

in case of breakdowns. It is found that a stator can be replaced in less time than insulation repairs can be effected. The small turbo-generator, which is of 800-kw. capacity, is an Oerlikon mixed-pressure set, which can utilise exhaust steam from the reciprocating continuous-current sets brought from the old stations. Of these latter there are four, each for 500 kw.; they consist of Belliss engines driving Crompton dynamos, and formerly ran non-condensing. A 475-kw. Bruce Peebles-La Cour motor-converter, which can be used as a connecting link between the D.C. and A.C. plant, completes the engine-room equipment. The continuous-current plant will be used to supply a certain amount of external load in the immediate neighbourhood, but is also important as supplying the whole of the auxiliary services of the station.

The boiler houses run at right angles to the main turbine room, and at present contain two rows of boilers, each row having its own flue and short steel chimney for forced draught. In one boiler house are five Stirling water-tube boilers, each of 20,000 lb. normal evaporative capacity per hour, and an overload capacity of 25 per cent. The first boiler in the other boiler house (from the turbine-room end) is a similar unit, and the others are

six Babcock & Wilcox boilers, each of 14,400 lb. evaporative capacity per hour, removed from Emambagh Lane. All these boilers are fitted with Underfeed stokers, and each range has its own group of Green's economisers. The coal bunkers are fed by bucket conveyors from the hoppers at the siding. The capacity of the left-hand bunker is 850 tons, and of the right-hand bunker 1,200 tons, which can be increased to 1,400 tons when a second conveyor is added.

The surface condensers to the Oerlikon turbines were all supplied by W. H. Allen, Son & Co. (Bedford), and are arranged without any shut-off valve between the turbine exhaust and the condenser. The air pumps are driven by continuous-current motors. Condensing water is obtained from the River Hooghly. Owing to the muddy condition of the river, it was considered desirable to have the intakes as near to the surface as possible, and floating intakes were provided, arranged on a jetty and connected to jointed pipes. There are in the pump house by the river a set of four vertical-shaft centrifugal pumps direct coupled to 80-B.H.P. continuous-current motors, and having a capacity of 6,500 gallons per min. Both pumps and motors are of Messrs. Allen's manufacture. The intakes are screened with grids, and the water is taken to the pipes leading to each condenser by open channels or goits four feet wide, arranged as shown in the plan. Feed-water is also obtained from the river, and a storage and settling tank (not shown in the plan) is provided near the middle of the site. The feed-water and make-up water is handled by Allen and Holden & Brooke pumps, and is passed through a Lassen & Hjort treatment plant. The feed pumps are of Weir's make.

The whole of the switchgear was supplied by the British Thomson-Houston Co. (Rugby), and is mounted in a steel frame-

FIG. 2.—SKETCH MAP SHOWING POSITIONS OF SUB-STATIONS.

work in three tiers, with the high-tension gear in stonework cells. The trifurcating boxes and instrument transformers are in the lowest tier, with the cells containing the oil switches above and the control boards at the top. The switches are mechanically operated. Ferranti liquid resistance feeder charging apparatus is employed, and surge arresters of the electrolytic type are provided. The gear is divided into four main sections, each controlling one alternator and four feeders, and another section controlling the small alternator and the motor-converter. It will eventually control the 800-kw. alternators and the motor-converters. Duplicate bus-bars run throughout, and can be sectionalised by automatic oil switches, motor operated, which can break heavy loads if necessary. Two Tirrill regulators are provided. In general, one regulates the whole section, while the other is kept as a stand-by; but it is possible to use one on each section when the bus-bars are divided into two sections, which are to be kept at different voltages. It may be mentioned here that the neutral points of the alternators are not earthed. The continuous-current board, which does not call for special remark, is quite separate.

The feeders leaving the stations are 3-core 0.15 sq. in. section wire-armoured, lead-covered, paper-insulated cables laid solid in bitumen in cast-iron troughs, and were supplied by W. T.

Glover & Co. (Trafford Park, Manchester). All are of this one size, rated at 1,000-kw. capacity. The feeders leading to the Howrah sub-station have to cross the Hooghly River, and are specially armoured for the purpose. They are in duplicate, and the laying of them in the river was a work of no small magnitude, considering that the weight of each drum was about 14 tons. They are specially insulated, and were tested for double the present working pressure, so that when the load is much increased the same maximum current can be put through them at a higher voltage by transforming up, as this might possibly be a less expensive course than laying new cables in the river.

Most of the old stations have been turned into sub-stations, and some new ones have also been added, bringing the total number up to seven. Their positions are shown in the sketch-map in Fig. 2. With the exception of Ultadanga, all are equipped with Bruce Pebbles-La Cour motor-converters in numbers varying from one to six of 475 kw. There are nineteen of these machines in all, including one in the Cossipore main station, those in the sub-stations being distributed as follows:—Howrah, two; Jackson's Lane, three; Prinsep Street, six; Wellesley Street, three; Alipore, three; and Chetla, one. This last machine was moved from Howrah, where there were originally three. The sets at Ultadanga are Dick Kerr synchronous motor-generators, three in number, of 500-k.v.a. capacity each. The sub-stations deliver continuous current to a three-wire system, with 450 volts across the outers, and all balancing is effected by mid-wire boosters. Extensive use is made of pilot wires to control the voltage at various parts of the network. The sub-station switchgear is on the same general lines as that in the main station, except that both the A.C. and D.C. control gear is mounted on the same panel for each individual machine. All the sub-stations except the small one at Chetla are provided with spark-gaps and charging gear. The equipment of the sub-stations is kept as uniform and interchangeable as possible in order to reduce the number of spare parts required to a minimum.

At the beginning of this year there were 230 miles of underground and 124 miles of overhead mains, a total of 354 miles. Connected to the mains were over 40,000 ceiling fans, the equivalent of 370,000 lamps of 8 candle-power, and nearly 2,000 motors varying from  $\frac{1}{4}$  to 300 h.p. in size. The maximum load at present varies from 5,000 kw. in summer to 6,000 kw. in winter, which may seem small compared to the capacity of the generating and distributing systems, but very large extensions of load, especially in connection with mill driving, are anticipated in the near future; and when it is said that a single mill will probably call for as much as 2,000 kw., the necessity for having so much plant in commission will readily be understood.

In conclusion, we should like to express our thanks both to the Calcutta Electric Supply Corporation and to the consulting engineers, Messrs. Kennedy & Jenkin, for permission to publish this description and for much valuable help during its preparation.

**A New Two-rate Tariff System.**—In our report of the Paper describing a proposed new two-rate system of charging by Mr. H. H. Perry (ELECTRICAL ENGINEERING, November 20th, page 649), we stated erroneously that the Paper was read in Birmingham. It was, of course, read at the meeting of the Manchester Local Section of the Institution of Electrical Engineers.

**The Institution of Municipal Engineers.**—At a meeting of the Institution of Municipal Engineers on Nov. 7th, Mr. Horace Boot, the newly elected President, gave his Presidential address. He dealt with a number of matters, including municipal power supply to mills and factories, and the growth of railless electric traction, and concluded with a plea for the federation of the various engineering societies. A conversazione was held in the evening at the Holborn Restaurant.

**Illumination.**—At a meeting of the Illuminating Engineering Society on Tuesday, Nov. 18th, a Paper by Mr. J. S. Dow and Mr. V. H. Mackinney on shadows by natural and artificial light was read. A number of photographs showing the effect of shadows in the wrong places in industrial lighting were exhibited, and interesting comparisons were made between the shadows cast by direct and indirect lighting. The intensity of the latter is greater than is generally supposed, but owing to the absence of sharp edges they are not so obvious. Cases where oblique lighting easily casting shadows is desirable were mentioned, such as for examining the back of a lay-off sheet in printing to see if the impression of the type is not too heavy. The question of the amount of shadow most suitable for showing off statuary, moulded decorations, and architectural detail, &c., was also discussed. Some authorities, said the authors, seemed to dislike the use of oblique lighting to show off surface ornaments, arguing that the effect produced is quite different from that of daylight, and therefore unnatural. At the same meeting Mr. L. Gaster gave some notes on progress during the vacation, mentioning the various congresses and exhibitions where illumination had been treated of, and Dr. J. Kerr gave some notes on the International Congress on School Hygiene, held in Buffalo last August.

## THE EFFECT OF MOISTURE ON INSULATION RESISTANCE

AN interesting Paper, entitled, "The Characteristics of Insulation Resistance," by Mr. S. Evershed, was read last night before the Birmingham Local Section of the Institution of Electrical Engineers, and will be discussed at the London meeting of the Institution to-night. The key-note of his Paper—which describes a long series of researches—is that the insulation resistance of the majority of materials in common use is governed almost entirely by the moisture that they absorb. Everyone knows, said Mr. Evershed, that insulation resistance decreases on a damp day and recovers during dry weather, but it is not so generally known that in most cases insulation resistance decreases, in a perfectly definite way and almost instantaneously, as the electric pressure upon it is increased, and slowly recovers if the pressure is restored to the initial value or cut off altogether. A typical curve showed that the insulation resistance of an absorbent material drops, at first rapidly, when the voltage is increased, then declines less quickly, and finally falls with a steep curve soon before the breakdown voltage is reached. Mr. Evershed's researches related chiefly to the less steep middle part of the curve. The majority of the measurements were made by the direct deflection method with a sensitive Broca galvanometer, using continuous current. Alternating currents were unsuitable owing to the magnitude of the capacity current relatively to the leakage current. A large number of typical voltage-insulation curves are given in the Paper, and those in which the voltage steps were retraced show an interesting hysteresis effect. It was contended that any true dielectric leakage that there might be through the substance of the insulators could be ignored, as the real dielectric resistance was enormous in comparison with the resistance of the leakage paths which are formed by traces of moisture. Incidentally, Mr. Evershed maintained that in tests of long cables the slow dying down of the charging current often made tests taken after the customary "one-minute's electrification" unreliable as regards disclosure of the true leakage current.

The curves shown for the insulation resistance of cotton containing various amounts of moisture are very instructive. In one case, for example, drying in an oven at 150° for two hours gave resistances five or six times greater all over the curve, and further drying raised the insulation to something like eighty times its original value. The curve, however, still showed the bend characteristic of the moisture effect. A similar effect was shown by paper, and the opportunity was taken to investigate the influence of mechanical pressure. Increase of pressure was found, roughly speaking, to decrease the change due to difference of voltage. The degree of moisture, however, although altering the value of the resistance enormously, alters the law of its variation with voltage but little until the paper is sensibly damp; finally, however, with the paper absolutely sodden, the curve is nearly a straight line of constant resistance. Micanite cloth and various other materials showed similar results, and Mr. Evershed writes that the composition of the insulating substance seems to be of little importance. So long as the structure of the material is such as to provide capillary spaces to harbour moisture, leakage will take place in the characteristic manner.

Although oils, varnishes, and such substances have an approximately constant resistance, the impregnation of paper by oil seems to have no effect in preventing the absorption of water, for curves of the same characteristic shape as before were obtained both with samples of oiled paper and an impregnated paper cable which had been left with its ends open for thirteen months. Again, it was found in experiments with insulated windings that varnish reduces the extent to which moisture is absorbed, but it seems powerless to stop absorption altogether if the windings are subjected to the temperature variations which occur in ordinary use. The author attributes this failure to exclude moisture altogether to insufficient elasticity in the body of the varnish. Unless this is a highly elastic substance it is unable to follow the expansions and contractions of the windings, and ultimately the continuity of the coat of varnish is broken up, leaving numerous crevices by which moisture can enter.

With a view to the elucidation of the ultimate nature of the phenomena, experiments were made with filter paper containing ascertained quantities of water of a measured specific resistance, and it was found that the resistance of the sample was out of all proportion to the water that it contained. Mr. Evershed therefore put forward the theory that the water must be considered to be divided into two very unequal portions, which may be called resistance water and dormant

water. In one typical case the resistance water formed only 9.4 parts in one million of the total, the major portion occupying blind alleys, so to speak, entirely off the paths of the leakage current.

The Paper then discussed the law of the resistance curve, which appears to be of the general form  $R = kx\sqrt{\frac{1}{v}}$ ,

where  $x$  has a value not much greater than 2. The author then dealt with the influence on the curve of non-absorbent insulators in series with absorbent material, and finally investigated the nature of the action by means of an ingenious model. He took two beakers of water, connected by an inverted capillary U-tube, dipping into both, and filled with a series of air bubbles between sections of water. A potential difference was applied to the beakers, and the behaviour of the bubbles was examined through a microscope, which revealed a progressive thickening of the water films on the inside of the tube, forming the walls of the bubbles starting from the positive end. This magnified demonstration of the nature of electrical endosmose gives us an idea of the way the water films on the wall of the diminutive channels of the absorbent insulating material are rendered more conducting by the change in their distribution produced by the applied voltage. Resistance curves taken with a model, with a number of capillary tubes in parallel, gave results exactly corresponding to those from absorbent insulators, including the hysteresis effect.

Finally, it is concluded that the broad principle of film conduction in an absorbent insulator is clear; the moisture curve—the first part of the complete characteristic curve—is the direct result of electric endosmose. The electrically produced hydraulic pressure drives dormant water into the films, and their increasing thickness is made evident by the gradual fall in resistance as the potential difference is increased.

## IMPORTANT FACTORY PROSECUTION

MESSRS. WILLIAM BAYLISS, Ltd., tube manufacturers, of Birmingham, were fined £55 and costs at the Birmingham Police Court on Friday, for neglect to comply with certain requirements of the electrical regulations under the Factories and Workshops Act. A man named George Farraday, working in the motor garage of the factory, received a shock from a hand-lamp and was unable to remove his hands from the lamp. He called to a fellow-workman, who switched off, but the lamp guard was still "live," and this man and another man received shocks on trying to pull Farraday away. Finally, after some delay, the man in charge of the electrical work was summoned from the works, and pulled down the flexible so that the man could be released. He was, however, unconscious for about four hours, and his hands were badly burned.

Mr. J. E. Harsdon, H.M. Inspector of Factories for the district, appeared in support of the summons, and Mr. G. S. Ram, H.M. Electrical Inspector of Factories, gave evidence. Mr. Ram stated that on testing he found that the potential between the lamp terminals and earth was 440 volts, although the installation was nominally a 110-volt installation. The pressure of 440 volts three-phase is used for driving the motors in the works, and the lighting circuits were taken off one of the phases presumably through an auto-transformer. The single-pole switch was, therefore, not sufficient to disconnect the lamp from the 440-volt mains.

The lamp itself did not comply with the Home Office regulations, as the guard was in metallic connection with the lampholder, and it was not earthed; the workshop flex had been cut at a sharp edge at the top of the lampholder, and this and the lamp guard had thus been made "live." The defence was that "electrical experts" had seen the apparatus only fourteen days before the accident, and had tested it, and that the defendants had been "let down" by these experts.

The case shows the extreme necessity of having factory installations properly installed under good supervision. The use of improperly constructed hand-lamps, sometimes consisting of a lamp merely in an ordinary metal lampholder, is unfortunately not rare, even in electrical stations where competent persons are in charge, and few people seem to realise that the use of auto-transformers for reducing the pressure across the lamp terminals does not reduce the voltage of the pressure as regards shock to earth, or even that single-pole switches do not cut off the pressure. There are safety-type hand-lamps on the market, some of which are so well protected that earthing may be dispensed with, and there seems to be no excuse for not making use of them.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,366.

During a sharp thunderstorm the telephone on the ground floor in a private house using electric light from the supply mains was struck by lightning. It was afterwards found that five of the metal filament lamps had their filaments completely shattered. The lamps were not in use at the time; there was not the least sign of blackening, no fuses whatever were blown, nor was there any trace of damage to the electric lighting installation. How would you account for this failure of the lamps—"F. T."

(Replies must be received not later than first post, Thursday, December 4th.)

### QUESTION No. 1,367.

The composition of an oil-resisting alloy is required, suitable for cast-metal tanks, for use with oil-immersed apparatus; the alloy must have been found successful in practice, and be inexpensive to make. Any special foundry precautions should be stated—"U. R."

(Replies must be received not later than first post Tuesday, December 9th.)

### ANSWERS TO No. 1,364.

How is the electrical equipment connected in a petrol-electric car, the engine being 40 horse-power, the dynamo being compound wound with interpoles, and the motor being series wound with interpoles? Show in the diagram how two different speeds are obtained by the shunt and series resistances and the reverse control, and state what efficiency of transmission should be expected—"ELECT. EQUIP."

The first award (10s.) is made to "W.H." for the following reply:—

The diagram (Fig. 1) shows the method of connecting up the electrical equipment of a 40-h.p. petrol-electric car. If the car is intended to be operated from either end it will be necessary to duplicate all the controllers, the circuit-breaker and connections to the controllers and circuit-breaker. The reversing controller, R.C., is interlocked with the regulating controller, C., so that until R.C. is either in "forward" or "reverse" it will be impossible to move C. from the "off" position; and further, when C. is in the "on" position on any stop it will be impossible to move R.C. to the "off" position. C. would be provided with a magnetic blow-out coil, R.C. would not. The circuit-breaker, C.B., will be so interlocked with R.C. that it will be impossible to replace C.B. once it has opened for overload, until C. and R.C. are both in the "off" position. It will be seen that the first four stops on the regulating controller, C., give a gradually strengthening shunt field on the generator, and therefore gradually increasing volts, while the motor, M., is on full field. Stops, S., divert a portion of the motor series field, and more current is diverted by the succeeding stops 6, 7 and 8, thus increasing the speed of the vehicle by weakening the motor field. The generator, G., will always run at full speed, being direct-coupled to the petrol engine, and thus the greatest efficiency and power will be obtainable. The overall efficiency from petrol motor output to electrical motor output should be somewhere in the neighbourhood of 75 per cent.

The remainder of the transmission losses would be very small as compared with an ordinary geared petrol motor, since direct drive could be utilised, or, at any rate, a single reduc-

tion, if it was desired to use high-speed motors. Even then, the losses should not amount to more than a further 7 to 10 per cent.

The second award (5s.) is given to "MARF," who writes as follows:—

The question re the wiring of a petrol-electric car raises some interesting points, and I have pleasure in putting forward the accompanying diagram, which I think will meet the case. It will be noticed that the windings for the interpoles are connected in series with the armatures both on the dynamo and motor, as the function of these small poles is to counteract the distortion of field, to which the armature current gives rise. Without these poles there is a tendency to sparking to occur at the commutator as the load varies. The dynamo windings should be designed so as to give a constant output for a given speed of the engine, i.e., the product of the volts and amperes should be approximately constant. This prevents the excessive rush of current through the motor whilst the latter is starting up, which would occur if the dynamo were wound to maintain a constant voltage. To start the car the engine would be set running and allowed to attain its normal speed, and the control finger moved on to the first contact. This puts the motor in series with the starting resistance, and allows the car to speed up gradually without unduly taxing the dynamo. When the car has developed a uniform speed on this notch, the finger must be moved on to the next contact. This cuts out the series resistance, and the car can then attain its normal speed. To increase the speed, the finger must be moved to the next position. This, as can be seen from the diagram, puts a resistance in shunt with the field windings of the motor, thereby weakening the field and accelerating the motor. In passing I would point out that this method is somewhat unusual, the more common method of regulating the speed of a series-wound motor being to divide the field windings into several equal parts, and to have the latter in series for ordinary speeds, and in shunt for higher speeds. To reverse the motor, the control handle is moved to the left. This reverses the field of the motor, and at the same time puts the starting resistance into circuit. A double-pole

switch is included in the circuit, also a fuse. This latter should be as near to the dynamo as is compatible with accessibility, so as to protect it in case of short-circuit. The fuse should be adequate to stand a current considerably above the normal working current, otherwise there will be a

FIG. 2.

tendency to "blow" on starting up. The combined efficiency of the motor and dynamo should be from 65 per cent. to 70 per cent. when running under normal conditions. That is to say, if the engine develops 30 h.p. at the dynamo shaft (while running normally), the output from the motor shaft would be approximately  $\frac{30 \times 70}{100} = 21$  h.p.

It will be noticed that at any rate one of the successful competitors has assumed that the vehicle is a tramcar, and that both run their engine at constant speed whatever load is demanded of it. In some systems a large part of the control is done on the throttle, and when the car is standing, the engine is only just turning round at a speed at which the dynamo will not excite, ready to be speeded up for the start, when the dynamo will pick up its voltage and start the motor with a smoothness unobtainable with any definite controller step. The system also has the advantage that the main circuit need never be broken, and no series resistances need be used, greatly simplifying the equipment. In this connection reference may be made to articles in *ELECTRICAL ENGINEERING* describing the Stevens petrol-electric system widely used on motor-omnibuses (Vol. VII., page 641, November 23rd, 1911, and Vol. VI., page 678, October 27th, 1910).

### STUDENTS' "RAG" IN A SUB-STATION

ON Wednesday night a mob of between seventy and a hundred students attacked the Albert Hall sub-station of the Kensington & Knightsbridge Electric Lighting Co. with a view to switching off the electric light in the Albert Hall, where the notorious James Larkin, of Dublin fame, was addressing a meeting.

The sub-station in question is one of the Company's three sub-stations to supply the three-wire D.C. system in the Company's area, and it deals with the central Kensington district.

The students forced the doors of the sub-station, and attacked the switchboard attendant (G. W. Walker) as he was making for the telephone for assistance. Fortunately there was another man in the sub-station, and also one in the adjoining distribution department, and assistance was telephoned for to the Kensington Court station. The Engineer-in-Charge there sent for the police and also proceeded himself to the sub-station, together with an assistant, to render help. The mob, besides breaking the telephones about, pulled off a few switches, but no serious disturbance was occasioned to the supply in the district. The total amount of damage has been estimated at about £20.

Two of the students, G. W. Elkington and A. Macallum, were detained by the police, and appeared at the police court on Thursday, charged with maliciously damaging telephones, electric lamps, switchgear and ironwork. Walker, the switchboard attendant, in giving evidence, identified Elkington as one of the men engaged in destroying the telephone boxes, but no evidence has been given that Macallum actually did damage, and his statement was that he was forced into the works by the mob. Both the accused were remanded on bail. Walker, who was slightly injured in the fight, showed considerable courage in resisting the attack, especially as such implements as a truck and pole were used as a battering ram to force open the doors.

### ELECTRIC TRACTION NOTES

Major Pringle's report to the Board of Trade on the Aisgill disaster, which occurred last September, has now been issued, and he makes it quite clear that the gas lighting of the trains was largely responsible for the fatal results. There were, he said, two sources of fire—burning gas and live cinders. He strongly urges on railway companies the desirability of employing electricity as their standard illuminant, and of constructing all new stock with electric lighting, as well as replacing as soon as possible the existing gas-lighted stock on main line and express services. This he points out is now the trend of general practice all over the world. In the United Kingdom alone from the end of 1910 to August 31st, 1913, the number of gas-lighted vehicles decreased from 41,474 to 40,536, whilst those electrically lighted increased from 10,808 to 11,906. Major Pringle also refers to cab signalling, particularly that adopted by the Great Western Railway at a number of important centres. (A description of this system appeared in *ELECTRICAL ENGINEERING* of March 7th, 1907; Vol. I., p. 431.) The method, he says, has not yet been proved to be efficient, however, to the extent of meeting adequately the very complicated requirements of traffic on English railways and has still to be experimented with more thoroughly. The wireless control of trains is mentioned as "still in its infancy." He recommends that the railway companies should unite in experimenting with the automatic train stop as used on the London Tube railways, which comes into contact with a stopcock on the train and automatically applies the continuous brake, to see if the method is reliable and practical at high speeds.

Another report deals with a slight accident which occurred near Shepherd's Bush station of the Central London Railway on September 30th. A stationary train was run into from the rear by another train, and a few passengers were slightly injured. This section of the line is worked by the lock and block system with Spagnoletti's electric interlocking apparatus, and the accident is attributed to a series of blunders made by the signalman, who availed himself of his emergency unlocking gear in a way described by Major Pringle as "incautious and stupid." The report concludes as follows:—"During the past year the Company have been replacing the old method of lock and block working on this tube railway by automatic signalling with track circuit work. I am informed that the last remaining section—Holland Park to Wood Lane—will be completed in a month's time. In the circumstances no more need be said than that an accident of

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published November 20th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**

**24,586/12. Oven.** SIMPLEX CONDUITS and F. G. TAYLOR. A pivoted hood is arranged in connection with a base and back plate, so that the heated air is always maintained within the hood. A turned-over edge or sealing plate on the hood makes joint with the back plate when the hood is open for this purpose. The heating element is fixed to the hood. Eight figures.

**25,499/12. Communication with Submerged Submarines.** A. TURPIN and R. ROBINSON. The submerged boat carries a vessel containing calcium carbide and water. The resulting gas causes it to rise to the surface, and take with it a communicating wire, so that a bell or hooter can be worked from the boat. The apparatus is set in operation by a solenoid controlling the water valves. Three figures.

**25,976/12. Molybdenum.** CHEMISCHE FABRIK VON HEYDEN A.-G. Bands, wires, &c., are obtained from a mixture of molybdenum with magnesium or barium oxide, or carbonate.

**26,177/12. Dynamos.** G. PLAISANT. The armature is given an epicycloidal motion in a magnetic field between two concentric annular poles. The arrangement is said to be of use for automobile lighting dynamos, and for wireless. Three figures.

**27,758/12 A.C. Distributing Systems.** B.T.-H. Co., E. GARTON, and A. H. WATSON. Constant frequency in an A.C. system supplied by an inverted rotary is obtained by varying the field through an exciter, by a Tirrill regulator, proportional to the speed variations. The regulator has a coil connected across a pilot generator driven at a speed proportional to that of the rotary, and a contact controlling solenoid with opposing coils, one across a steady pressure, and the other across the exciter armature. One figure.

**2,125/13. Arc Lamps.** M. S. OKUN. The electrodes, which are in a vacuum, are kept in slight contact during working. The pressure is controlled by a solenoid having its core directly connected to one electrode. The electrodes are held apart when the lamp is not working. Two figures.

**4,945/13. Circuit Breakers.** B.T.-H. Co. (*G.E. Co., U.S.A.*). A magnetic blow-out is constructed so that the flux generated by a current in the winding in portions of the pole faces adjacent to the arc, repels this away from them. The flux across the arcing spaces forces the arc away from the magnetising winding. Four figures.

**9,070/13. High Voltage Generators.** F. W. HOWORTH (*M. P. Ryder, U.S.A.*). Two sets of magnets are arranged to produce flux in opposite directions through the armature coils by means of two reciprocating iron "armatures," which move into and out of contact with the cores so as to close and break a magnetic shunt circuit round each of the coils. The armatures act in co-operation alternately, each to close a magnetic circuit through the coils and a shunt circuit round them during the breaking action of the other. Four figures.

**10,153/13. Wireless Telephony.** F. MAJORANA. To produce oscillations of a high group frequency, a rotary discharger has the rotating discs arranged with their axes perpendicular. One or both of the discs has a continuous metallic rim rising a little out of the plane of the disc. A cleaner or wiper is also provided. One figure.

**16,526/13. Alternators.** SIEMENS DYNAMO WORKS and G. H. TAYLOR. The end connections are made of copper strips through which insulated stiffening studs pass. These are fixed to the frame of the machine. Two figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** BEAVER and CLAREMONT [Water-proof cable covering] 22,355/12; SIEMENS DYNAMO WORKS, LYDALL and FAIRBURN [Change-over arrangements] 15,149/13; GILES [Safety devices for conductors] 15,951/13.

**Dynamos, Motors, and Transformers:** BROWN, BOVERI ET CIE. [Conductors] 6,036/13; SOC. INTERNATIONALE LUMIERE FROIDE (PROCÉDÉS DUSSAUD) [Pedal-driven lantern generators] 20,288/13.

**Electrometallurgy and Electrochemistry:** NELSON and MURRAY [Electrotypes] 27,911/12; SOC. GÉNÉRALE DES NITRURES [Aluminium nitride] 10,975/13; [Furnace element] 12,837/13; CIE. POUR LE TRAITEMENT DES METAUX ET DES MINÉRAIS PAR ÉLECTRICITÉ [Furnaces] 12,444/13.

**Heating and Cooking:** WILKINSON [Heating] 19,543/12; BERRY [Water heating] 22,546/12; HIRST and MAURICE [Irons] 29,350/12; ARPIN [Bath water heater] 10,403/13.

**Ignition:** LEITNER [Starting internal-combustion engines] 28,286/12; SYDENHAM, 4,965/13; ELEKTROTECHNISCHE FABRIK SCHAEFFLER [Mine-igniting machines] 12,813/13.

**Incandescent Lamps:** NAAMLOOZE VENNOTSCHAP PHILIPS' METAAL GLOEILAMPENFABRIEK, 1,340/13.

**Instruments and Meters:** HAMILTON and the FERRANTI CO. [Mercury motor meters] 26,359/12.

**Switchgear, Fuses, and Fittings:** WILKINSON [Lighting fittings] 24,953/12; B.T.-H. Co. and MCCARTHY-JONES [Automatic regulators for distributing systems] 25,286/12; B.I. Co. and BLADES [Multicore cable dividing boxes] 29,783/12; PERFECT [Quick make and break vibration-proof switches] 1,984/13; BLOXAM (*R. Bosch Co.*) [Terminals] 6,551/13; EICKHOFF [Explosion-proof inner cover for cable wells] 6,587/13; ELECTROMOTOR EQUIPMENT CO. and BARLOW [Motor-driven controllers] 11,069/13; SIEMENS & HALSKE [Relay] 17,879/13.

**Telephony and Telegraphy:** W.E. Co. (*W.E. Co., U.S.A.*) [Printing telegraph systems] 25,382/12; [Transmitter for selective system] 6,767/13; [Paper feeding for printing telegraphs] 6,768/13; [Re-inking mechanism for printing telegraphs] 19,124/13; SIEMENS BROS. and LAIDLAW [Two-line telephone instrument] 25,673/12; THOMSON [Signalling] 9,632/13; DOS SANTOS [Telegraph stations] 11,243/13; MCBERTY [Telephone exchanges] 19,421/13.

**Traction:** VEDOVELLI, PRIESTLEY ET CIE. [Overhead construction] 11,310/13.

**Miscellaneous:** POLLARD and EMMOTT [Magnetic separators and screens] 25,195/12; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Refractory materials] 25,370/12; ASPREY and FARROW [Striking mechanism for electric clocks] 26,194/12; PREWETT [Signalling on motor vehicles] 819/13; FORD [Synchronous working of cinematographs and gramophones] 1,036/13; GRIFFIN & SONS [Gyrostats] 8,379/13; PELLI [Alarm for safes] 10,087/13; MAGNET WERK GES. EISENACH SPEZIALFABRIK FÜR ELEKTROMAGNET-APPARATE [Holding magnets for metal-working machines] 22,706/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Arc Lamps:** SIEMENS-SCHUCKERT. [Searchlights] 24,312/13.

**Distributing Systems, &c.:** SOC. SCHNEIDER ET CIE. [Pressure dividing devices] 21,309/13.

**Dynamos, Motors and Transformers:** WEISS [Oil transformers] 24,162/13; SCHERBIUS [Conversion of alternating current] 24,615/13.

**Heating and Cooking:** MADSEN [Toasters] 24,419/13.

**Ignition:** DIRAND [Spark plugs] 11,737/13.

**Telephony:** ZIVNOSTENSKA BANKA V. PRAHA [Exchanges] 20,856/13; SIEMENS & HALSKE [Semi-automatic] 24,459/13.

**Traction:** SOC. D'ELECTRICITÉ MORS [Switches for railways] 22,127/13.

**Miscellaneous:** EDISON [Illumination] 24,711/13.

### Extension of Life of Patent

**24,048/99. Telewriter.** F. RITCHIE. The life of this patent, on the application of the National Telewriter Co., Ltd., has been extended from 14 to 19 years. See also under "Telephony and Telegraphy," page 667.

### Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** W. G. HEYS (*Scott Elec. Co., U.S.A.*) [Multiple carbon flame lamps: Arcs controlled by own magnetic field] 17,655/07.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** A. S. ADLER [Railway train lighting system using axle-driven dynamo, storage battery, and automatic switches] 17,141/02 and 17,142/02; B.T.-H. Co. (*A.E.G.*) [Control of a number of motors simultaneously driving a common load] 16,621/08.

**Ignition:** I. ZUBALOF [Make and break effected electro-magnetically] 17,062/03.

**Storage Batteries:** R. M. LLOYD [Casing and arrangement to indicate when the electrolyte is leaking away. Also arrangement for exhausting the gases, &c., suitable for use in submarines] 15,916/01; [Rigid cell casing for traction, &c.] 15,817/01.

**Miscellaneous:** W. L. WISE (*A.-G. "Magna," Switzerland*) [Oscillating clock armature] 15,833/01; P. A. NEWTON (*F. Schürmann, Germany*) [Cigarette making machines] 17,106/04; D. P. GHADIALI [Use of high-pressure sparks for producing indelible records] 16,493/08.

this description shows that lock and block working in itself does not afford the security necessary for this kind of traffic."

Traffic on the Baker Street & Waterloo (Tube) Railway was suspended on Monday from 4.30 till 5.5 p.m. It appears that, owing to a mechanical defect, a brake bracket fell from a train at Edgware Road station on to the "live" rail, and caused an earth. Current was cut off while an examination was made, but as soon as the bracket, which was found welded to the rail, was removed, running was recommenced.

The reports by the Town Clerk, Borough Surveyor, and Borough Electrical Engineer, upon the electrification of the Stirling tramways, referred to in our last issue, have been referred to Mr. Peter Fisher, General Manager of the Dundee Tramways, and Mr. J. A. Robertson, Borough Electrical Engineer at Greenock, for consideration.

It was stated at the meeting of the National Electric Construction Co. that an important continental tramway concession is likely to be brought to a successful conclusion at an early date. All the local authorities, who number thirty, have come into line.

The Board of Trade have sanctioned the use of double-decked trolley buses between Brighton and Hove, on the understanding that the width of the vehicles is not to exceed 7 ft., on account of the comparative narrowness of some of the streets. The buses will not run along the sea front, and the scheme will now go forward with the agreement of the Hove Council. Current will be supplied by the two Councils, each in its own area.

The notices of bills which are to be promoted in the next session of Parliament include a number of applications for trolley omnibuses, but probably the most noticeable is that by the North Eastern Railway Co., which proposes to instal this type of vehicle for conveying passengers and goods between its stations in Newcastle and Gateshead. Another railway matter of considerable interest is the proposal of the Midland Railway Co. to enter into agreements between the London Electric Railway Co. and the Underground Electric Railways Co. of London, for taking a supply of electrical energy, presumably in connection with the conversion of the Tilbury-Southend line to electric traction, upon which the General Manager of the Midland Railway Co. recently stated the Company is prepared to spend £1,000,000. It is also proposed to revive the scheme of the Isle of Wight Junction Railway for connecting up the Isle of Wight with the main land by means of an electric tube railway under the Solent. The venture this time seems to be promoted by the London & South Western Railway Co. The tube railway scheme between North and South Shields is also to be revived.

The conversion of the suburban lines of the London & North Western Railway to electric traction is making good progress, and the line from Willesden to Earl's Court is now practically completed, so far as the track work is concerned. According to *The Times*, it is hoped to obtain delivery of the rolling stock at an early date, and to begin service in February. Pending the completion of the Company's own power-house at Stonebridge Park, current will be purchased from an outside source.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The hearing before Mr. Justice Warrington last week of the application for extension of life of Patent No. 24,048/99, by F. Ritchie, which was brought by the National Telewriter Co., Ltd., has resulted in the life of the patent being prolonged by five years, so that it will now expire on December 2nd, 1918. Evidence was given by Professor C. Vernon Boys, Sir John G. Craggs (Chairman of the National Telewriter Co.), and by the inventor, Mr. F. Ritchie. The evidence showed that the same people had consistently put money into the concern since the start, but had not yet received any return. Mr. Ritchie has been paid an annual salary of £400 to £500 as Works Manager, making in all about £7,000 cash, plus about one-fifth interest in the present Company. After many attempts the Post Office, in March, 1908, granted the Company a licence for twenty-one years certain and permission to establish telewriter exchanges. Since this time the business has regularly extended. For the half year to June, 1909, the amount received from rentals was £801, while from July of the present year to date the amount is £6,453. There are now two telewriter exchanges in London, one at Wallbrook and one at Charing Cross, and one at Liverpool. In 1907 the whole rights were offered to the Post Office for £70,000, but the offer was not accepted. There was no opposition, but

the application was watched by the Solicitor-General, Mr. S. Buckmaster, on behalf of the Board of Trade. He admitted the usefulness and merit of the invention, and suggested that an extension of life of five years might be allowed. (In general, the maximum allowable is seven years.) In granting the extension Mr. Justice Warrington said that he was governed in his decision by the fact that there had been nothing in the nature of gambling with the shares.

Mr. J. St. Vincent Pletts, A.C.G.I. (Chief of the Patents Dept., Marconi's Wireless Telegraph Co., Ltd.), gave the third of his series of lectures on Wireless Telegraphy at the City & Guilds (Engineering) College last Thursday. He showed mathematically how the energy of one oscillatory circuit is inductively transmitted to a second oscillatory circuit in tune with the first. The form of the final equation shows that the resulting current is both pulsating and oscillating. If the frequency of the components is designated by  $a$  and  $b$ , the frequency of pulse,  $N=a-b$ , which is also equal to  $1/T$ , where  $T$  is the time period of the pulse. The coefficient of coupling,  $k = M/\sqrt{L_1 L_2}$ , where  $M$  is the mutual induction between the two circuits, and  $L_1$  and  $L_2$  their self-inductions respectively. In practice  $k$  is quite small; it cannot be zero, as then no energy would be transmitted from one circuit to the other. It does not, however, usually exceed 5 per cent. Calling  $n$  the natural frequency of either circuit,  $k=N/n$ , so long as the coupling is small. Now  $TN=1$ , therefore the number of oscillations in a pulse varies inversely as the coupling, but as it is difficult to count the oscillations in a pulse it is usual to determine the wave-lengths, and so determine the coupling. If the difference in wave lengths,  $\lambda_1, \lambda_2$ , is not very great,  $k=(\lambda_1-\lambda_2)/\lambda_1$ . When the reaction of the second current on the first is considered, it is found that initially current and voltage in the primary are in the same direction, but they are in opposite directions in the secondary, i.e., there is an oscillation of energy from one circuit to the other. When the effect of resistance in the circuits is considered, it is found that the damping is given by  $(R_1/L_1 + R_2/L_2) \div 4(1 \pm k)$ , i.e., the damping of one wave is greater, and the other less, than the mean. At the station at Clifden with a wave-length of 19,500 ft. and a total resistance in circuit including the spark of 0.022 ohms, the coefficient of damping is 0.025. The spark frequency is 500 per second. The whole oscillation lasts about 0.001 sec.; therefore the time between two sets of waves is also 0.001 sec. The oscillation of energy from one circuit to another may be demonstrated by a mechanical analogy consisting of two pendulums a little distance apart, suspended from a stretched string. One is started oscillating, and as its amplitude dies down that of the other increases to a maximum, which in turn dies away, while the first one grows again, and so on. The gradual change in phase relations, as takes place in the electrical circuit, is also shown. If a chain having three times the time period of one of the simple pendulums is substituted for one of these, it is set oscillating with a third harmonic, i.e., there is a node in it, about  $\frac{1}{3}$  of the total length from the lower end. This distance, however, is not exactly  $\frac{1}{3}$ , for the tension throughout is not uniform. The next lecture will take place to-day at 5 p.m.

A large meeting of the 160 members of the newly formed Wireless Society of London was held on Tuesday evening in the Westminster City Schools, with the President, Mr. A. A. Campbell Swinton, presiding. It was announced that the club-rooms at 107 Hatton Garden were ready, except that no licence or instruments were yet obtained, though nearly £100 is now promised for the latter purpose. With regard to the granting of licences to experimenters, the President said that the Post Office would not in future grant them for stations near shipping routes, Government or Marconi stations. As the aims and objects of the Society have vastly increased since its foundation, it was proposed by Mr. Russell Clarke and seconded by Mr. F. Hope-Jones that the subscription be raised to one guinea per annum for London, and 10s. 6d. per annum for country members, plus an entrance fee of 10s. 6d. The rules and objects of the Society are now provisionally settled, and may be obtained from the Hon. Sec., Mr. R. H. Klein (18 Crediton Road, West Hampstead, N.W.). Dr. W. H. Eccles (Vice-president) outlined the programme of work of the Radio-telegraphic Committee of the British Association, and pointed out how the Society could help this Committee in its important work. The next meeting will be held in January, when the President will deliver an address. It is hoped to provide for the reading of three or four important Papers during the year, and informal discussions at frequent intervals.

Beyond an interruption to Cassinga, Angola, there is no further news to communicate this week regarding cables and landlines.—The interruptions reported of the French West Indian cable system still continue.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 671. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**WOODWORK, &c.**—In bringing its price list up to date, C. Jennings & Co. (Pennywell Road, Bristol) has provided this with a stiff cover. The 270 pages of this convenient list embrace almost every product of the woodworking industry. Illustrations and full details in regard to prices for electric light casings and cappings, as well as creosoted troughings for underground cables are given. It is claimed that whether creosoted by dipping or by pressure the material used is free from injurious acids. Sharp flexion and fatigue is minimised by the use of long lengths. The Company points out that it supplies these troughings both for home and export. Large stocks of teak are also held at the depot. We are very pleased to receive from the Company a strong four-fold brass-jointed 2 ft. rule, similar to those it advertises, which will be sent in conjunction with the price list, post free, on receipt of 1s. 6d.

**TELEPHONE EQUIPMENT.**—The Stromberg-Carlson Telephone Manufacturing Co. (Rochester, 1050 University Avenue, New York) is issuing lists dealing with a number of its numerous manufactures, including C.B., magneto, party and private line telephones, exchange equipment, dry cells, the "Deffone" for deaf people, mining telephones, linesman's tools, &c.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**PRINTING-PRESS CONTROL.**—A pamphlet from J. H. Holmes & Co. (Newcastle-on-Tyne), serves once more to remind one of the large amount of electrical equipments for printing offices that the company has carried out. We note that 25,000 h.p. in "Castle" D.C. and "Holmes-Clayton" A.C. motors is now installed for driving printing machines. Among the specialities is a hand-operated starter with interlocked shunt regulator, so that the motor is always started with full field strength, and a steel-beaded panel by which the whole apparatus is controlled through a double-pole switch. Again, an automatic starter and regulator combined, fitted for pilot control and interlocked with the shunt regulator, is listed.

**ELECTRIC LIGHT FITTINGS.**—Another pamphlet from the same firm deals with searchlights for marine purposes, and robust fittings for use in ships, workshops, factories, &c.

**ILLUMINATED SIGNS.**—An attractive booklet, entitled "That Blue Light," deals with the system of illuminating electric signs, canopies, and façades by means of mercury vapour lamps. The publication is to be obtained from the Westinghouse Cooper-Hewitt Co., Ltd. (80 York Road, King's Cross, N.), which has carried out a number of bold schemes, some of which are illustrated. It is also pointed out that silica lamps can be installed in the existing ornamental gas lantern, still often seen outside various buildings, so as to compel attention and yet not to necessitate a great expense.

### FOOL-PROOF MOTOR CONTROL PANELS

WE are able to illustrate here two motor-control panels recently introduced by the Igran Electric Co., Ltd. (147 Queen Victoria Street, E.C.). These are known as the "Conspede" and the "Varispede" starting panels. The former is illustrated in Fig. 1. Both have been used, we are informed, in large numbers, both at home and abroad. As may be seen from the illustrations, there is only one handle in the "Conspede" panel, while in the "Varispede" there is in addition the handle of the shunt regulator, which is electrically interlocked. As the latter panel embodies all the features of the former, it will be sufficient to describe this. The connections are shown in the diagram, Fig. 3. The shunt field regulator shown at the top is arranged so that it can be short-circuited by a contact controlled by a spring and opposing magnet in series with the holding-on magnet of the starter. When the shunt regulator handle is moved to the resistance all-out position (*i.e.*, to the right), it depresses the armature of the magnet against its spring, so that the short-circuit is removed. If the circuit is then closed, there is sufficient current through the magnet to hold the armature,

so that any movement of the regulator handle may now be made; but as soon as the circuit is broken the resistance is short-circuited, and when next the motor is started full field is automatically put on; nor can this be altered until the handle of the regulator is brought hard over to the right so as to depress the armature against the spring as before.

The holding-on circuit of the clapper switches is controlled through two contacts on the single-starter handle passing over

FIG. 1.—CONSPEDE PANEL.

FIG. 2.—CLAPPER SWITCH.

FIG. 3.—CONNECTIONS OF VARISPEDE MOTOR CONTROL PANEL SHOWING "ARC-PREVENTING INTERLOCK."

two concentric metal rings on the starter base. One of these contacts—the one on the outer ring—consists of a wheel, part of the periphery of this is an insulator and part of metal in connection with the contact engaging the inner ring. As the handle is moved the inner contact passes from the dummy stud to the live stud, and the wheel of the other contact rotates so that the metal part comes into engagement with

the ring, and the circuit, through the clapper switches, is completed, thus closing the main circuit. The wheel is prevented from rotating further by a stop, and continued forward motion of the starter handle speeds up the motor in the ordinary way. However, should any backward movement be made, the little wheel rotates so that the metal part no longer engages the ring, and the clapper switches open. To prevent any forward motion of the starter handle putting the clapper switches into circuit again, the inner ring is divided and a resistance inserted, as shown, so that the current is reduced sufficiently to keep the clapper switches closed, but yet is not sufficient to close them after they have been opened. It will thus be seen that the main circuit is always broken by the clapper switches. These are shown in Fig. 2 and are of very robust construction with copper and carbon break, and have a strong magnetic blow-out. It is seen that overload and no-voltage attachments are provided in these panels, and the circuit may be opened by depressing a push-button switch. The clapper switches and their connections make up what is aptly called an "arc preventing interlock," for the only other circuit which is ever broken is the holding-on circuit of the clapper switches, where the current is necessarily very small indeed. These one-handle control panels will no doubt become almost universal, especially where unskilled labour is employed.

### ELECTRICAL SUPPLIES

**D**URING the last few months there have been many new varieties of lighting, heating and cooking equipments put on the market, and the inclusion of some of the best of these in the 1914 edition of the catalogue issued by Drake & Gorham, Ltd. (1 Felix Street, Westminster Bridge Road, S.E.), has necessitated its being about twice as big as the one it supersedes. The very convenient system of thumb indexing the various sections has been adhered to, while the usefulness and accessibility of every item in the catalogue has been enhanced by the inclusion of a complete index, giving both section and page number. As practically every kind of electrical supply is listed, it is difficult to particularise. We may mention that the list of flexibles, in addition to the qualities for ordinary installations, includes varieties for ship, stage, crane, motor-car and other purposes. Price's system of heating for houses, offices, green-houses, garages, &c., is illustrated and described in the section on heating apparatus. The heating element is contained in a large, thin iron pipe. Another useful contrivance is a motor-driven carbonic acid gas refrigerating plant, made in three types. These machines occupy but little space, and take but little power to drive them. In the section on fittings are shades and reflectors for every purpose, hand-lamps to meet the Home Office regulations, electric torches and battery lanterns of robust construction for use in difficult situations. There is no electrical contractor or dealer in accessories who should be without a copy of this catalogue, which will be sent to anyone who cares to apply for it, mentioning **ELECTRICAL ENGINEERING**.

### CORRESPONDENCE

#### CABLE CASINGS.

To the Editor of **ELECTRICAL ENGINEERING**.

DEAR SIR,—We should be pleased to have the opinion of your readers whether it is advisable to screw the capping on casings in the centre or at the edges of the capping. In manufacturing these casings and capping it is our desire to manufacture it to suit the wishes of the electrical trade generally. When the cappings are nailed or screwed on the outside edges, the capping is less likely to gape open and allow dust to go inside the casing, in which case the thicker timber would have to be left on the outside of the grooves and reduce the centre portion somewhat. On 1½-in. casing, what is the best shape, therefore, which will suit the trade? Any replies from your readers on this point would be appreciated, whether given by sketches or figures.

Yours, &c.,

C. JENNINGS & Co.

Pennywell Road, Bristol.  
November 22nd, 1913.

**Osram Lamp Patents.**—Judgment in default of defence, with inquiry as to damages, was obtained yesterday in Mr. Justice Astbury's Court by Osram Lamp Works, Ltd., against the Oro Light and General Supply Co., Ltd., for infringement of Osram metal filament patents.

## MODERN ENGINES AND POWER GENERATORS.

By Rankin Kennedy, C.E.

The Coupon below entitles any reader to a complimentary copy of an illustrated booklet, describing what is probably the most valuable work upon this subject ever published.

The importance of the subject is growing day by day, and "The Book of Modern Engines and Power Generators," can easily prove of the greatest value to those who desire to be fully informed upon the latest developments in every branch of the subject.

The author, Mr. Rankin Kennedy, C.E., is well known as an authority on his subject, and in this work he explains in the clearest and most thorough manner the design and construction of prime movers; the term is here used in its widest sense, as it applies to all engines, whether worked by petrol, oil, steam, air, gas, water, or electricity, and as it includes all machinery and processes connected with power generators and distribution.

### ENTIRELY UP TO DATE.

Moreover, all these subjects have been brought entirely up to date. The previous Edition of the work achieved such an immediate success, that for the new and Revised Edition, the scope of the work has been widened and extended so as to cover every branch of the subject, by the addition of a great amount of new matter, and many new illustrations of very great interest and high value.

This new Edition is indeed already recognised as the standard work on its many varied subjects, including Rotary Engines, Gas Turbines, Gas Engines, Oil Engines, Petrol Engines, Suction and Producer Gas Engines, Blast Furnace Gas Engines, Marine Engines of every design and type, Compressed Air Motors, Air Compressors, Refrigerating Engines, Windmills, with electric storage, Fluid Hydraulic Engines, Water Pressure Engines, Hydraulic Rams, Water Pressure Turbines, and Water Raising Engines, Centrifugal Pumps and Air Lifts, Power Distribution and Transmission by Gearing, Water Pressure, Compressed Air and Electricity, etc.; etc.

### OVER 2,000 ILLUSTRATIONS.

The work is profusely illustrated by diagrams, text-cuts, and plates. In all there are over 2,000, every one of great practical utility to the engineer.

Enough has been said to show that this work is indispensable to all electrical, mechanical, steam, and hydraulic engineers, and to all who are concerned with manufacturing, designing, draughtsmanship, electro-chemical, and metallurgical work, with automobiles, tramways and railways, boilers, shipbuilding, collieries and mines, etc.

We would advise those who are determined to keep abreast with all the latest specialist knowledge concerning every detail of their profession to send for the free booklet which is supplied by the publishers to those mentioning this paper.

## A FREE BOOKLET.

To the CAXTON PUBLISHING CO., LTD.,  
97, Surrey Street, London, W.C.

Please send me, free of charge, a copy of the book describing the "Book of Modern Engines and Power Generators," and showing how it can be obtained for a first payment of 1s. 6d., the balance to be paid by small monthly payments.

## STREET LIGHTING WITH ORNAMENTAL POSTS

MUNICIPAL AUTHORITIES in this country are sometimes apt to give less attention to the æsthetic aspects of street lighting than to its more utilitarian object. Streets lighted artistically as well as efficiently attract people to a town and to the business streets, and thus increase the wealth and therefore the rateable capacity of the community. In this connection the British Thomson-Houston Co.

ORNAMENTAL LAMP-POSTS OUTSIDE THE B. & K. ELECTRIC RESTAURANT, EARL'S COURT ROAD.

(Mazda House, 77 Upper Thames Street, E.C.) remind us of an ornamental street-lighting standard of artistic and dignified design, which they introduced not long ago, and was illustrated in *ELECTRICAL ENGINEERING*, March 6th, 1913. This standard consists of a Corinthian pillar surmounted by four arms and a single central point. The standard is 9 ft. to the top of the ironwork, and its proper equipment is one 200-watt and four 100-watt Mazda lamps enclosed in Alba globes. The Alba globes are sufficiently dense to render the lamp filament invisible, but, on the other hand, the light absorption is very small. The globular shape and smooth exterior surface permit the rain to wash away all dirt and dust, so that the globes always appear clean. Altogether, the new B.T.-H. standard, with its complete equipment of Alba globes and Mazda lamps, forms a very distinctive street-lighting unit—the general use of which would greatly enhance the appearance of some of our streets. Two of these B.T.-H. standards, equipped with Alba globes, have been erected outside the Brompton & Kensington Electric Restaurant in the Earl's Court Road, and are seen alight in the illustration. They are ornamental both by day and by night, and give an air of refinement and distinction to the exterior of the restaurant, which has undoubtedly contributed to its present popularity.

## LOWERING GEAR

THE London Electric Firm (George Street, Croydon) write us that many remarkable problems present themselves for solution in the prosecution of their business as lowering gear experts. One of these was involved in the gear illustrated here, which is an eight-ring contact-suspension gear for suspending from a dome an electrolier, suitable for seven circuits, for a church in Edinburgh. It will be noticed that the gear is not pendant (which is the more common practice), but is supported from beneath, being located between the inner and outer structures of the dome of the building. The firm believe their concentric system of contacts is the only one by which multi-circuit problems can be satisfactorily solved.

Amongst other similar gears they have done are a number of four-contact gears for picture theatres, giving two entirely different circuits for red and white lights; also five-ring gears for a hall in Edinburgh. Ordinary single-circuit gears for lowering semi-indirect fittings, electroliers, &c., for cleaning, renewal of lamps, &c., have been common things with them for many years.

In all cases the weight of the fittings—sometimes reaching as much as 20 cwt.—is taken by their well-known positive acting weight relieving feature, by which the weight is only on the winding rope during the actual raising and lowering operation. Their patent self-sustaining winches are also used

8-RING LOWERING GEAR FOR LARGE ELECTROLIER.

in conjunction with these fittings, so that even when raising and lowering, the weight of the fitting is always under safe control.

## A FINE WINDOW DISPLAY

THE General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), have sent us the illustration given here of a window display of G.E.C. material in Victoria, Australia.

This display, in which Osram lamps form a prominent feature, was arranged by Messrs. McQueen, of the township of Hamilton.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Aylesbury.**—A loan of £20,800 is to be applied for in connection with the new electric supply scheme.

**Barbados.**—The Barbados Electric Supply Corporation, Ltd., proposes to extend its generating plant.

**Bradford.**—One 5,000-kw. turbo-alternator, storage batteries, boosters and switchgear, and two 1,500-kw. rotary-converters, transformers and switchgear. City Electrical Engineer. December 19th. (See advertisement on another page.)

**Cleethorpes.**—Extensions are to be carried out at the electricity works.

**Dundee.**—An additional 5,000-kw. alternator is to be installed at the Carolina Port power house, at an estimated cost of £36,500.

**London: Stratford.**—A Local Government Board inquiry is to be held to-morrow concerning a loan of £21,500 for electrical extensions.

**Stepney.**—The Finance Committee of the L.C.C. recommends sanction to a loan of £7,180 for electrical extensions.

**Neath.**—A Local Government Board Inquiry was held last week concerning a loan of £9,536 for electrical purposes. The inquiry was adjourned in order that the Council's officials might supply a statement showing the difference between the loan sanctioned and the amount actually expended upon the undertaking.

**Rathmines.**—Loans of £11,000 for additional generating plant, and £1,500 for wiring are to be applied for.

**South Africa.**—The *African World* states that the Johannesburg Council requires six motor-converters. London agents, Messrs. E. W. Carling & Co., St. Dunstan's Buildings, St. Dunstan's Hill, E.C.

**Turkey.**—Tenders are invited by January 14th in respect of a concession for an electric lighting installation at Dardanelles. Further particulars, 73 Basinghall Street, E.C.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Barnet.**—New infirmary.

**Bingley.**—Electric lighting of Town Hall. Borough Engineer.

**Broadstairs.**—Concert Hall in High Street.

**Camborne.**—Extensions to County School for Girls. Secretary, County Hall, Truro.

**Durham.**—Residential school for children. Education Committee, Shire Hall.

**Falkirk.**—Cinematograph theatre (£3,000). Falkirk Picture House, Ltd., 18 Brandon Street, Motherwell.

**Glasgow.**—Tenders are invited for an electric lighting installation at the Langside Library. Town Clerk, December 1st.

**Kingston-on-Thames.**—Additions to workhouse. Union Offices, Coombe Road.

**Leeds.**—Cinematograph theatre, Queens Road. Architects, T. Winn & Sons, 84 Albion Street.

**London: L.C.C.**—265 points at the Ocean Street elementary school, Mile End. (See advertisement on another page.)

**Paddington.**—An expenditure of £90,000 is contemplated on public baths in Porchester Road.

**Manchester.**—Baths (£13,000) at Levensholme. City Architect.

**Thirsk.**—New cinematograph theatre, Long Street.

**Weymouth.**—Electric lighting and power equipment at new bakery, Cromwell Road, for Weymouth & District Co-operative Society.

### Miscellaneous

**Aberdeen.**—Additional rolling stock is required by the Tramway Department.

**Australia.**—Copper track bonds and accessories for Melbourne Suburban Railways. Consulting Engineers, Messrs. Merz & McLellan, 92 Victoria Street, S.W. (See advertisement on another page.)

**Rotherham.**—Two electrically-driven, automatically controlled pumping sets capable of delivering 1,800 gallons per minute against a head of 25 ft. are required. Borough Engineer.

**Southend.**—After some discussion, a proposal by the Highways Committee to place thirteen electric lamps in South-

church Road has been sanctioned. There was considerable opposition in favour of the adoption of high-pressure gas.

**South Yorkshire.**—The Joint Municipal Board, known as the Don Valley Light Railway Joint Board, is to be created for the purpose of constructing tramways to serve the Don Valley between Barnsley and Mexborough. The estimated cost of the scheme is £120,000.

**West Hartlepool.**—Tenders are invited for electrical equipments of tramcars. General Manager, December 3rd.

## TENDERS RECEIVED AND ACCEPTED

**Grimsby.**—The tender of Messrs. W. Lucy & Co. for house service boxes and fittings has been accepted at £171 6s. and £48 16s. respectively. The same firm's tender for house fuse boxes at £153 has been accepted, and a contract for metal filament lamps has been placed with the Cryselco Co.

**London.**—Messrs. Scholey & Co. have received an order from the British Westinghouse Co. for their special tool steel gears and pinions for the whole of the equipments required in the electrification of the suburban lines of the London & South Western Railway. This constitutes the largest single order ever placed in this country for gears and pinions.

**Rotherham.**—A repeat order has been placed with Messrs. E. Bennis & Co. for two mechanical stokers, and self-cleaning compressed air furnaces in the Corporation power station.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £68 to £68 10s. (Last week, £70 10s. to £71 10s.)

**The Electrical Co., Ltd.**—This firm has appointed Mr. G. S. Helme (late of the Lancashire Dynamo & Motor Co.) to be their Engineer and Sole Representative in Scotland. Mr. Helme will take up his appointment immediately, his headquarters being at the firm's present Glasgow address, Baltic Chambers, 50 Wellington Street.

**Switchboard Manufacture.**—Mr. S. Ferguson has resigned his position as Chief Draughtsman to Messrs. Ferranti, Ltd., and is joining Mr. G. Pailin for the purpose of carrying on the business of switchboard building. The new Company is Messrs. Ferguson, Pailin & Co., Edward Street, Higher Openshaw, Manchester, and has no connection whatsoever with Messrs. Ferranti, Ltd., but is prepared to build up switchboards with any specified make of detail gear.

## John E. Raworth,

Queen Anne's Chambers, Chartered Patent Agent  
39, Broadway, Westminster, London, S.W.

### EVERY INSTALLATION ENGINEER

Should join his Trade Protection Organisation,  
THE

**ELECTRICAL CONTRACTORS' ASSOCIATION**

(Incorporated).

Inquiries cordially invited by the Secretary,

L. G. TATE,

20, Bucklersbury, LONDON, E.C.

## LOCAL NOTES

**Accrington: Supply for Outside Districts.**—In connection with the recent recommendation that the gas plant at the generating station should be duplicated, negotiations are being carried on with one or two outside districts for a supply either in bulk or in detail.

**Barnsley: Electrical Fittings.**—The Corporation is seeking powers in the next session of Parliament to supply electrical fittings, &c., and to enter into contracts, if necessary, for carrying out the work.

**Brighton: Supply to Railway Co.**—A new arrangement has been entered into by the Corporation Electricity Department with the London Brighton & South Coast Railway, under which the Railway Co., instead of paying a minimum of £1,000 a year for current as at present, will take a minimum of 1,000,000 units per annum, and in addition take all power and lighting supply for their workshops from the Corporation mains.

**Dundee: Broughty Ferry Power Station.**—Following on the amalgamation scheme sanctioned by Parliament last year, arrangements are being made to link up and standardise the Broughty Ferry electric supply scheme with that of Dundee. The cost is estimated at between £800 and £1,000.

**Hove: Purchase of Company's Undertaking.**—The purchase money to be paid by the Hove Corporation for acquiring the electric lighting undertaking from the Hove Electric Lighting Co. has been practically agreed at the sum of about £175,000 mentioned in our last issue, and we have reason to believe that the Council are open to receive proposals for working this concern together with that of their own undertaking in Aldrington (which is at present supplied "in bulk" from Brighton). In round figures, £200,000 is estimated by the Council as the value of the combined undertaking. The Council, we believe, are sanguine as to the likelihood of arranging with a suitable purchaser, as they consider that the undertaking involves considerable possibilities in the way of supplying current for power for the proposed trolley 'buses, street lighting, and other purposes, and the Hove Electric Lighting Co. has for some time paid good dividends and accumulated a reserve fund of many thousands. Particulars are obtainable from the Town Clerk, Hove Town Hall.

**Llanfairfechan: Electric Lighting.**—Having considered the estimated cost of a water-power electric supply scheme, the Council has decided to take current from the North Wales Electric Power Co. The terms of the Power Co. for a minimum supply of 24,000 units on a seven years' contract, are a charge of £120 per annum for two years, and £150 per annum for the remaining five years, upon which terms it is estimated that the Council can supply current at from 5½d. to 6d. per unit.

**London: L.C.C.: Greenwich Power House Breakdowns.**—The cost of repairing the machinery at Greenwich in consequence of the breakdown a few months ago, and also the cost of taking a temporary supply of current from outside authorities during the repairs, was £1,713, of which £759 represents the cost of the temporary supply of current. Arrangements have been made with the London Electric Supply Corporation to take a supply up to 1,800 kw. per annum at £3 per kw. per annum, plus 0.35d. per unit, pending the completion of the work of substituting turbines for the existing reciprocating engines at Greenwich. The Company will supply the necessary switchgear and meters at its works at Deptford, and cable ducts between the Council's line of ducts and the Company's generating station, whilst the Council will provide the necessary feeder cable between the Company's works and the nearest sub-station.

**Marylebone: Electric Cooking Apparatus.**—The Board of Trade recently issued a regulation providing that the framework of cooking apparatus, as well as the guard protecting the heating elements, should be efficiently earthed. A further regulation has now been made which provides that the

covers of the switches, framework and guards of the appliances shall be efficiently earthed.

**Motherwell: Electrical Exhibition.**—An electrical exhibition is now being held under the management of the Electricity Department.

**Tynemouth: Electric Cooking.**—A series of demonstrations of electric cooking was commenced on Tuesday by Mr. F. S. Grogan, of the British Electric Transformer Co., makers of the Tricity cooker, at Tynemouth. The arrangements were made by Messrs. Gillespie & Beales (Amberley House, Norfolk Street, Strand, W.C.), sole wholesale agents for Tricity cookers, in conjunction with Mr. C. Turnbull, Borough Electrical Engineer.

## APPOINTMENTS AND PERSONAL NOTES

Mr. J. J. McGregor, at present Assistant Engineer at the Deptford generating station of the London Electric Supply Corporation, has been appointed Charge Engineer at the L.C.C. Greenwich power station, at a salary of £250, rising to £300.

The Blackpool Tramways and Electricity Committee recommends that the salary of Mr. C. Furness, Borough Electrical Engineer and Tramways Manager, be increased from £700 to £900 per annum.

Mr. Walter T. Young, Traffic Superintendent of the Oldham Corporation Tramways, has been appointed to a similar position at West Ham.

We are informed that Mr. J. H. Collings, who for many years has been connected with the Electrical Fittings Department of the General Electric Co., Ltd., at their Head Office, 67 Queen Victoria Street, London, E.C., has been appointed by the Board of Directors to the important position of Manager of Sales Counters and Showrooms, at the Queen Victoria Street premises. Callers at the General Electric Co.'s Head Office will find Mr. Collings ready and willing at all times to devote personal attention to their requirements.

**Important London Electric Supply Scheme.**—The outstanding electrical feature of the Parliamentary notices which are just appearing is a proposal of the County of London Electric Supply Co., either by itself, or in combination with other London electric supply companies, to seek powers for the London County Council and the companies to agree to postpone the date at which the L.C.C. can at present purchase the electric supply companies' undertakings of London. This date at present is 1931. This scheme is evidently the outcome of certain negotiations, rumours of which were in circulation just over a year ago; reference to these was made in our issue of October 17th, 1912. At the meeting of the L.C.C. on Tuesday, in reply to a question, the Chairman of the London Electricity Supply Committee said that the Committee were not aware of what lay behind the notice given by the County of London Co., but that the Council's officers had been instructed to report on the scheme as soon as the bill has been deposited. Nothing, he added, could be usefully done before this, as the notice did not necessarily offer any reliable information as to what was in the bill. We shall, however, publish further details of the scheme in a few weeks' time.

**Advertising Electricity Supply.**—We have received from Mr. E. Calvert, Hon. Sec. Associated Municipal Electrical Engineers (Greater London), copies of correspondence between that body and the Local Government Board on the question of the legality of expenditure by local authorities on advertising electricity supply. A similar point had been raised by the Commercial Gas Association. The letter from the Local Government Board encloses a copy of the reply which had been given to the Commercial Gas Association, and states that its provisions as regards the purchase of literature apply equally to electric supply undertakings. While the Board considers that it could not properly give sanction to payment of subscriptions by local authorities to such a body as the Commercial Gas Association, it is advised by the Law Officers of the Crown that "publications containing information so immediately connected with the discharge by a local authority of their duties, as to be likely to enable them to discharge those duties more efficiently, might legally be purchased by the local authority." It will be seen that this only covers the actual purchase of advertising literature, and that the question of other forms of advertising is still as uncertain as it was before.

## SUMMARY

Two new 3,000 kw. Oerlikon turbo-alternators, running at 3,000 r.p.m., have been put down at the Marylebone Electricity Works, which formerly only contained continuous current plant. (Page 675.)

The future of the Edison battery vehicle in this country was discussed most hopefully at the opening of a new showroom last Thursday. (Page 677.)

AN article on Mr. S. Evershed's Paper before the Institution of Electrical Engineers, suggests that his hypothesis as to the nature of conductance through absorbent insulators, might well apply to practically all commercial insulators. In the same article the main points raised in the discussion on the Paper are reviewed, and a curve is given showing Mr. E. H. Rayner's tests on insulation resistance at "breakdown" pressures. (Page 678.)

THE report of Sir Henry Cunynghame on the Cadder Pit disaster does not attribute the fire to electrical causes. (Page 679.)

SOME descriptive notes are given on an exhaust steam colliery generating plant. (Page 679.)

AN important order for electric winding plant for the Rand is referred to. (Page 680.)

IN a Paper presented to the American Institute of Electrical Engineers, Mr. H. H. Clark deals with the dangers attending the use of electricity in mines, as well as its advantages. In another Paper Mr. F. B. Crosby deals with the electrically driven mine fan, using alternating current power, and discusses at length the advantages of dynamic control. (Page 681.)

THE specifications of several patents of interest to mining electrical engineers and electro-metallurgists

were published last month. Included is system of taking up the peak loads on a winding or rolling-mill plant, which is protected by the B.T.-H. Co. and C. McCarthy-Jones. Other patents relate to mine signalling, furnaces, including one for zinc smelting, magnetic and electrostatic separators, &c. (Page 682.)

SOME notes are given on the career of Mr. James Howden, whose death we announced last week. (Page 683.)

OPPOSITION has been entered by the Osram Lamp Works, the B.T.-H. Co., and Duram, Ltd., to the grant of a patent for producing ductile tungsten to Wolfram-Laboratorium Ges. The grant of a patent to Wolfram-Lampen A.-G. for resilient filament supports is opposed by the Brimsdown Lamp Works, Ltd. (Page 683.)

A COMMITTEE has been appointed by the Board of Trade to investigate the causes of explosions with cables laid in bitumen. (Page 684.)

THE signs of trouble with turbine blading are discussed in our Questions and Answers columns. (Page 685.)

THE two students who were charged with doing damage at the Albert Hall sub-station on the occasion of the recent Larkin meeting at the Albert Hall, have been discharged on giving an undertaking to pay for the damage. (Page 684.)

THE Irish Local Government Board has remitted a surcharge of £2,800 paid to Belfast tramway employees under a profit-sharing scheme.—The Kearney High Speed Railway Co. has abandoned for the present its intention to apply for powers to construct a railway from the Strand to the Crystal Palace.—The Baker Street and Waterloo Railway is now linked up with the Paddington terminus of the Great Western Railway. (Page 685.)

THE Hull Corporation is recommended to accept an offer by the Postmaster-General for the sale of the Post Office telephone system in Hull at £192,423, the price which the Post Office paid to the National Telephone Co. (Page 685.)

THE specifications published by the Patent Office on Thursday last include one by Siemens Dynamo Works, F. Lydall, and C. E. Fairburn, for an arrangement for changing over the connections on railway vehicles running at two pressures, e.g., 600 and 1,200 volts. Another interesting specification, by C. J. Beaver and E. A. Claremont (W. T. Glover & Co.), details a construction of waterproof cables by which small defects are shown upon test. Restoration of a lapsed patent for railway signalling, by W. Reid, is being sought. (Page 686.)

A DUST-TIGHT liquid starter is described on page 687.

AN illustrated article exemplifies two methods of lighting cinematograph theatres, and a remote control circuit-breaker is described on page 688.

SEVERAL letters have been received from wiring contractors in reply to Messrs. C. Jennings & Co.'s query last week. The general opinion—with but one excep-

tion—is that the present practice of screwing the capping of 1½ in. casing on to the centre fillet should be continued. (Page 689.)

AN effective showcard is illustrated on page 690.

EXTENSIONS are contemplated at Darlington (£21,190); Bedford (£10,000); Accrington; and Adelaide (£20,000).—Rotary converters are required at Johannesburg; electric charging apparatus for a large number of L.C.C. fire stations; petrol-electric omnibuses in New Zealand; and two automatic electric lifts at Ashton-under-Lyne.—Two South African railway lines are recommended for electrical working. (Page 691.)

MR. H. RICHARDSON, the Dundee City Electrical Engineer, has made a very strong report upon the condition of the Broughty Ferry undertaking.—An interesting lecture was recently given in Haslingden on the electrical driving of cotton mills, by Mr. J. W. Crowley, of Siemens Bros. & Co.—The Manchester electricity output last week constituted a record.—The recently appointed Borough Electrical Engineer at Redditch is opposed to the feeling held by several councillors that the electricity undertaking should be sold.—The electrical arrangements in connection with the Widnes transporter bridge have been reconstructed. (Page 691.)

The option on the part of the County of London Electric Supply Co. to acquire a site of 23 acres near Barking, was the subject of questions in the L.C.C. on Tuesday. (Page 692.)

*Professor* \* \* \* \* \*.—This equation gives the current flowing into the cable. The term  $V/F$  can usually be neglected.  $F$  is insulation resistance,—which may conveniently be called the INsulation.

*Intelligent Student*.—And is the expression under the root the IMPedance?

## NEW TURBO-GENERATORS AT MARYLEBONE

SINCE we published a complete description of the generating station of the Borough of St. Marylebone Electric Supply Department (see *ELECTRICAL ENGINEERING*, Vol. I., p. 63, Jan. 10th, 1907), there have been one or two minor alterations in the equipment, notably in connection with the arrangement of the switchgear, but the greatest change the station has seen is the introduction of extensions in the

without even removing the small D.C. sets. Compared to the older D.C. sets of 2,000-kw. capacity, they look very small indeed (as shown in Fig. 1). The main advantages obtained by the high speed of the sets are low first cost and improved steam consumption, although the conditions under which this plant is running are not quite the best. It is only possible to give the sets 190 lb. per sq. in. steam pressure

FIG. 1.—GENERAL VIEW OF ENGINE ROOM SHOWING ONE OF THE NEW TURBO-ALTERNATORS IN THE FOREGROUND.

form of three-phase alternating-current plant, part of which is now at work. It will be remembered that the station was originally equipped with continuous-current turbo-alternators only, but when large extensions became necessary, it was decided to take advantage of the better economy that a high-tension alternating-current system of distribution can afford. Two new 3,000-kw. Oerlikon turbo-alternators were therefore ordered, and these are particularly interesting sets

at the stop valves, and 100° F. of superheat, whereas the full pressure to obtain the best economy would be 250 lb. per sq. in. Even under the existing conditions, however, the steam consumptions guaranteed are 13.27 lb. per kw.-hour (with a 95 per cent. vacuum) at full load, 13.73 lb. at three-quarter load, and 14.7 lb. at half load. The actual official test has not been carried out yet, but from tests at the makers' works, in the presence of Mr. T. K. Richardson

FIG. 2.—3,000-KW. OERLIKON TURBO-GENERATOR AS ERECTED AT MAKER'S WORKS.

from several points of view. One is now running, and the other is nearly ready. They are, we believe, the first sets for running at as high a speed as 3,000 r.p.m. of their size to be put down in this country, and they are remarkably small in size for their output. There was no difficulty in finding space for them in between the existing sets, and, indeed, with plant so compact for its output there would be room in the engine-room for two more of the same size

(Station Superintendent), the steam consumption appears to be about 5 per cent. better than the guarantee, and rough check figures taken at Marylebone resulted in about 4 per cent. to the good. The first set commenced running on load on October 27th, and no hitch has occurred, which is very creditable to the power station and sub-station staffs, who were accustomed to continuous-current work. The capital cost of the whole extension was £42,000, and Mr. A. H.

in Fig. 4, is also very compact. It was also made by the Oerlikon Co., and is rated at 8,000 kw. normal rating, or 4,000 kw. for six hours as an overload at 6,600 volts, three-phase, 50-cycles unity power factor. It is of the two-pole revolving field type, with slotted cylindrical core and distributed winding. It is of particularly substantial construction in view of the high speed. A small exciter is coupled to the machine by a flexible coupling. The alternator is enclosed and ventilated by fans of special design to give high efficiency, mounted on the rotors. The air is drawn through channels formed by the existing cable races—incidentally keeping them cool—from a wet air filter which has been erected outside the engine-room. This was supplied by the Sturtevant Engineering Co. The air is discharged from the "chimney" of the machine into the engine-room. The spraying of the water in the chamber of the air filter is effected by a large number of nozzles of a special pattern which completely atomise the water. The washed air then passes through a baffle plate screen with water running over part of the surface of the plates, and is freed from all suspended spray or other matter.

The condensing plant was supplied by the Worthington Pump Co., as sub-contractors to the Oerlikon Co. At present its erection is not complete, and the first set is being run temporarily on the condensing plant belonging to the small Parsons continuous-current sets, which are now rarely used.

Each condenser has been designed to deal with 52,500 lb. of steam per hour, maintaining a vacuum of 28½ in., with the barometer at 30 in., and consists of a rectangular surface condenser with 10,500 sq. ft. of cooling surface, and some 10½ miles of solid brass tubes provided with 52-in. exhaust openings and 26-in. circulating inlet and outlet openings. Owing to the comparatively high temperature of the circulating water, namely, 75° F., which is within 16° of the temperature due to the vacuum, a very large volume of circulating water is required for condensing purposes, and centrifugal pumps are provided, each 22 in. in diameter, of a capacity capable of delivering at the rate of 11,400 gallons per minute, and delivering this volume of water against a total static and frictional head equal to 50 ft. The efficiency of these machines is very high, and when discharging at the above rate, they require 220 B.H.P. to drive them. The air pumps are of the vertical triplex suction valveless type, having 20-in. air cylinders at 12-in. stroke, with attached lift pumps, 6 in. by 9 in., running at 135 r.p.m., the condensate being delivered into the hot-well tank for boiler feed supply. Each condenser is provided on the exhaust opening with a flexible galvanised steel expansion piece, and exhaust steam valve with a 5 B.H.P. motor for controlling and promptly opening and closing the same, and on the back of the valve is provided an atmospheric opening, and an automatic exhaust valve is directly carried over it. Owing to the original arrangement of the plant being of such a nature that extensions had only been contemplated on the basis of the existing plant, it was necessary for a considerable rearrangement of the existing piping to be made. All the condenser motors are of the Oerlikon auxiliary pole shunt-wound type, specially constructed for condenser work.

Although there is room on the roof for the addition of another cooling tower, this has not yet been done, and condensing water will be drawn from the adjoining canal. Even though as good temperature conditions will not be obtained as would be with a cooling tower, the effect on the ultimate efficiency will be compensated for by the smaller power taken in pumping, as the head to the top of the cooling towers on the roof is considerable.

The new switchgear is situated alongside the continuous-current gear in a gallery at the side of the engine-room, and was supplied by Ferranti, Ltd. The actual high-tension gear is in brickwork cells behind the marble control panels, and the switches themselves are hand operated. Duplicate bus-bars are provided, arranged at present to be connected or disconnected by links, but probably bar coupling oil switches capable of breaking under load will be put in later. As remarked before, the speed of the turbines can be regulated from the switch gallery.

Three high-pressure feeder cables, supplied by British Insulated & Helsby Cables, Ltd., transmit the power from the generating station to Manchester Square, where there is a special selector panel, by means of which any combination can be made to feed either at Manchester Square or connect to the two cables which continue on to Rathbone Place. At the generating station there is one Westinghouse 1,000-kw. rotary-converter; there is also one at Rathbone Place, and there are two at Manchester Square. All these rotaries are standard and interchangeable. They are fitted with self-synchronising apparatus and A.C. boosters, the latter being

necessary not so much on account of power-factor correction, but on account of the variation in voltage required for the continuous-current distribution from 490 to 560 volts.

In conclusion we wish to thank Mr. A. H. Seabrook (General Manager, Marylebone Electricity Supply Department) for giving us information regarding the plant, and to Mr. T. K. Richardson (Station Superintendent), who conducted our representative round the works, as well as to Mr. G. Wütrich, of the Maschinenfabrik Oerlikon, from whom we received the drawings and photographs from which our illustrations have been prepared, together with technical particulars of the plant.

## EDISON BATTERY CARS

A NUMBER of those interested in electrical and automobile matters congregated on Thursday last as guests of the Directors of Edison Accumulators, Ltd., at a lunch on the occasion of the opening of the Company's new show-rooms at "Edison Building," 2 and 8 Duke Street, Piccadilly, W. In the large showroom on the ground floor a number of Edison battery propelled vehicles were on view, prominent among which were examples of the finely finished Arrol-Johnstone-Edison passenger cars for town use, such as we described in connection with the Olympia Exhibition (*ELECTRICAL ENGINEERING*, November 13th, 1913, p. 629). There were also some Detroit cars of American manufacture, and to engineers perhaps one of the most interesting objects was a solidly made 5-ton commercial chassis propelled by a single motor in the rear of the vehicle driving through bevel gearing, differential and side chains. This is equipped with a battery weighing about 1½ tons, and under ordinary conditions is said to be capable of about forty miles on one charge. Samples of all the different sizes of Edison cells made, separate plates and various accessories were also examined with interest by the large company present, which included many well-known station engineers, large users of commercial vehicles and others. We do not propose to deal with the details of the cell and its advantages here. These have been fully set forth already in *ELECTRICAL ENGINEERING* (see Vol. VI., p. 319, March 19th, 1910; Vol. VII., Exhibition Supplement, p. 67, October 12th, 1911; and Vol. VIII., p. 377, June 26th, 1912). We have long had the Edison battery preached to us and we were met together to welcome the inception of a scheme for enabling it to be practised.

The lunch was presided over by Lord Montagu, who is chairman of the company, and the principal toast of success to the Edison battery was proposed by Mr. W. R. Cooper, who said that the Edison cell had a high reputation to live up to, but much scepticism to live down. There was plenty of field both for the lead cell and the Edison cell, but for traction there was much in its advantages of durability, and ability to be left discharged or charged at a very high rate without damage. In the United States there were some 37,000 battery vehicles running, including 12,000 heavy trucks, produced by 37 makers. The matter here largely depended on the encouragement of station engineers in giving low rates for charging current. Lord Montagu, in his reply, made it clear that they did not want to make extravagant claims for the Edison battery, and also referred to the wide use of the battery car in America, which showed us a large field for the electric car, especially for the two extremes of ladies' use for town work and very heavy goods traction. The low rates for charging current that were beginning to be obtainable in this country made all the difference. He quoted some tests made by the R.A.C. on an Edison battery propelled car weighing 29 cwt., which went 312.3 miles for 19,180 watt hours with an 8-cwt. load, i.e., a total of 1.85 tons, giving 378 ton miles at an average speed of 11.52 miles per hour. The efficiency worked out at 60 per cent., and with energy at ½d. per unit the power cost was 0.167d. per ton mile against 0.25d. per ton mile, as the best that petrol could give. As the price of liquid fuel went up and that of current went down, the difference would increase still more. Mr. Bernard Drake also replied, and told some amusing tales of the early battery days in England and present-day sales methods in America. The future of the battery vehicle in England lay in the hands of the supply authorities. He thought that a uniform price of ½d. per unit for charging current would yield them a large and important load. In replying to the toast of the guests, which had been proposed by the chairman, Mr. A. H. Seabrook (General Manager, Marylebone Electricity Supply) dwelt on the public health aspect of the question, and said that it was significant that in Berlin the police had given up licensing petrol cabs, and in future would only issue licenses to electric cabs. Mr. J. E. Edgecome (Borough Electrical Engineer, Kingston-on-Thames) also replied, but thought that all stations could not get down quite as low as ½d. per unit. He had great hopes that the special committee formed by the Municipal Electric Association would do much to forward the cause of the electric vehicle in this country.

## MOISTURE AND INSULATION RESISTANCE

THE main object of Mr. S. Evershed's Paper before the Institution of Electrical Engineers, summarised in our last issue, was to put forward a theory, based on a long experimental research, as to the physical nature of the conductance through insulations of the absorbent type, such as impregnated paper, cloth or fibre. Both in the discussions in Birmingham and London last week, however, the speakers chiefly devoted themselves to side issues not directly relevant to the main theme of the Paper, but this may have been simply because they were prepared to accept Mr. Evershed's deductions implicitly, and had little to add in the way of comment or criticism. In fact, there seems to be no reason to doubt that Mr. Evershed is correct in his hypothesis as to the nature of the leakage through an insulator which has absorbed small quantities of moisture—that is to say, any insulator of the "absorbent" class under normal conditions.

The question arises, however, whether one might not go even further, and extend the hypothesis to "non-absorbent" insulating materials, which very probably have minute quantities of water in their composition—e.g., gutta percha and indiarubber (whether vulcanised or pure), and other insulators, the preparation of which for industrial uses does not preclude the presence of moisture. When searching for a definite conception of the mechanism of conductance in an insulator, one ought not to neglect to take into consideration the phenomenon popularly known as "electrification" noted in a cable during the insulation test. The current passing through the insulation gradually decreases, and although, for the conventional value of insulation resistance for comparative purposes, the value of the current is taken one minute after its initial application, it falls off gradually for several hours with many classes of dielectric. Those whose duty it was to test impregnated cotton, jute or paper cables in the early days of the industry (before the introduction of vacuum dryers), know well that this so-called "electrification" was more marked in cables not sufficiently dried, but the shape and character of the curve was the same whether the dielectric was a partially dried impregnated fibre or paper on the one hand, or indiarubber or gutta percha on the other hand. It is therefore extremely doubtful whether this gradual "electrification" is due, as currently supposed, to a gradual increase of the physical stress on the dielectric with time. A natural insulator, such as the mica in a well-made mica condenser, reaches its final value very soon after the application of the testing battery, and a well-dried, impregnated paper or cotton cable has a much shorter period of "electrification" than one to which the drying process has not been applied long enough. Had Mr. Evershed taken some of the insulators which he classifies as non-absorbent, but which show this "electrification," and tested them over a range of voltages, it is quite probable that he would have obtained from them the same characteristic "moisture curve."

Although the drop of insulation resistance with increased pressure—and possibly also the peculiar phenomenon of slow "electrification"—may be due entirely to the moisture in the cable, it does not follow that the exclusion of all moisture with a view to increasing the insulation resistance is always desirable. Mr. B. Welbourn (of the British Insulated and Helsby Cables, Ltd.), in the discussion in London, reminded us of the fact, well known to the cable manufacturer, that a too complete drying process has the result of making the dielectric brittle.

Mr. Evershed's experiments were all made with continuous current, owing to the difficulty of differentiating between capacity and leakage current when alternating current is employed. Mr. E. H. Rayner, of the National Physical Laboratory, however, showed by an interesting curve, reproduced opposite, that it is possible to obtain a good idea of the true leakage current during an A.C. test. He applied a high-tension A.C. current at 2,500 volts to the specimen of insulation under test through a transformer, as indicated in the diagram, at the same time superposing a D.C. current at 100 volts through a micro-ammeter which was unaffected by alternating currents. The gradual drop of the insulation resistance up to the breakdown point is clearly shown in the curve. The dotted lines show the effect of removing the A.C. pressure for half a minute, and indicate that up to the actual moment of breakdown the insulation resistance is not permanently destroyed. On the other hand, it is interesting to mention a remark with regard to cable networks made by Mr. Welbourn, to the effect that there was less trouble due to low insulation resistance on A.C. networks than on D.C. networks—probably owing to the well-known trouble of low insulation on the negative pole due to endosmose

driving the moisture from the positive to the negative pole. Mr. C. J. Beaver (of W. T. Glover & Co.) assured the meeting that cable tests were now always taken with negative currents, but mentioned specifications which called for a difference of only 5 per cent. in insulation resistance of the cable tested with positive and negative currents respectively.

As the discussion will doubtless be published shortly in full in the *Journal* of the Institution, we need only refer briefly to

some of the other interesting points referred to at the meeting in London. Prof. Silvanus P. Thompson gave a glowing testimony to the value of the Paper, an equally happy exposition of the true meaning of Ohm's law, and assisted the proper appreciation of Mr. Evershed's theory of the conduction through films of moisture by the description of some beautiful experiments that can be made. Incidentally, he referred to vulcanised fibre as "neither vulcanised nor fibre," and suggested the rather unfortunate abbreviation "insulance" for insulation resistance. Mr. Beaver pointed out that if cables were tested until the "electrification" were complete, the relation between the space occupied by the testing rooms and the remainder of the cable factory might have to be reversed. Mr. Wordingham (Admiralty) pointed out that the difference in the insulation resistance when tested with positive and negative currents was known in 1892, and he and others supported the utility of the "blind" flash test which Mr. Evershed might be thought to have disparaged in his Paper. Mr. Welbourn approved the utilisation of the middle conductor of triple concentric cables as the negative, and Prof. Schwartz (Manchester University) quoted historic tests to show that pure rubber was absorbent, and suggested that the distribution of moisture in a dielectric would quite possibly have the same characteristics as the distribution of sap in trees which had recently been investigated.

**Institution of Electrical Engineers.**—The following is the result of the ballot for new members at the meeting on Thursday:—*Members:* W. F. Dawson, E. Thomas. *Associate Members:* C. E. Allsopp, D. E. Bailey, J. I. Brooks, A. G. Bruty, J. Colin, H. A. Davies, A. K. Erlang, W. A. Fairgrieve, F. C. Hall, L. F. Haslam, W. G. Heath, W. G. Hendrey, C. M. Herbert, D. G. Hurlblatt, M. M. Inglis, P. Ingouville, Z. D. King, W. Lawson, F. G. Licence, A. W. McArthur, C. G. Makins, W. H. Morris, K. A. Mountain, C. C. O'Brien, C. R. Palmer, C. S. Plank, T. A. Pond, F. B. Preston, G. H. Richards, L. J. Rouard, H. F. Simon, H. A. Starkey, H. Stone, F. G. Stuckenschmidt, C. Suggate, J. Warwick. *Associates:* H. Freeman, J. W. Punter. *Graduates:* B. C. Chatterjee, H. S. Coleman, B. Das, G. Goldthorp, T. P. Keady, B. J. Leggett, H. Leivesley, C. W. Pearce, N. S. Pillai, H. C. Rennick, C. J. Skittrall, H. Taylor. *Students:* E. Allen, S. D. Anderson, S. J. Baldwin, J. Barratt, H. A. Bly, J. Brandrich, R. G. Burton, W. H. Cable, F. Carter, H. H. Curtis, E. L. Damant, E. A. Deacon, N. Devonald, L. A. Gripper, D. K. Hall, C. E. Hawkins, W. Howe, C. Huddleston, E. H. James, N. R. Khambhati, N. Lall, J. H. Lee, H. K. Love, A. P. Mackie, H. L. Mansell, K. P. Menon, E. Midgley, W. Moody, A. Morris, S. Mouras, F. N. Mowdawalla, F. T. Obert, D. E. O'Donovan, A. S. Padgett, C. A. Powell, R. H. Smith, A. H. Todd, B. B. Walker, F. S. Weston, J. B. Windle. *Candidates Transferred:*—*Associate Member to Member:* W. M. I'Strange, F. H. Michell, C. G. Nobbs, H. S. Reid. *Associate to Member:* J. C. Darby, L. Fuller, F. Graham, J. E. Williams. *Graduate to Associate Member:* E. W. Fleming, A. A. Hurry. *Student to Associate Member:* F. Carr, J. L. Eve, J. Hacking, G. F. Hilton, F. R. Hoggett, B. Hoyle, W. E. Sale, S. N. Whitehead. *Student to Graduate:* B. Dees, S. Fahmy, J. V. Gomes, A. K. Modi, M. Sadick, E. F. Turner.

## ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Correspondence on any of the subjects dealt with in this Section is cordially invited from our Readers.

The Editor is willing to insert letters over a *nom de plume*, but Correspondents should send their full names and addresses in all cases.

Letters should be addressed, "THE EDITOR, ELECTRICAL ENGINEERING, 203-206 Temple Chambers, London, E.C., and should reach this office by the 21st of the month.

Correspondents are requested to write on one side of the paper only.

### THE CADDER COLLIERY DISASTER

IN view of the uncertainty as to the cause of the fatal fire at the Cadder Colliery on August 3rd last, and the allegations in some quarters that it was due to electrical causes, the publication of Sir Henry Cunynghame's report is of special interest. The report recapitulates the circumstances of the fire and the arrangement of the electrical installation in the part of the pit in question. About 125 ft. from the pit bottom, along the main haulage road, or "main dook brae," is a cabin used by the firemen, and where books, &c., are kept. Next to the cabin is a telephone space, and next to this, again, a switchboard room. The main cables led down the shaft to a switchboard placed in the switchboard room. They were single cables armoured; from the switchboard two unarmoured cables led back to a lighting switch 70 ft. from the pit bottom. These cables consisted of seven strands of No. 14 wire, rubber-insulated, taped and braided, and were supported on porcelain insulators as far as the haulage-switch; after that they were suspended by flexible cords affixed to nails in the timber of the roof. Direct current was supplied at 500 volts and the lamps were put in groups in series on this cable. Some were of 120 volts and some of 250 volts. Electricity had been used in this pit in 1906, but in June, 1913, it was reconstructed and remodelled. Single cables (armoured) led inbye from the switchboard into the mine to work coal-cutters and pumps. There was no suggestion made by anyone but that the electrical work was well and substantially done. "It will be observed, however," continues the report, "that the lighting cables were unarmoured."

In the first place it appeared that the origin of the fire must have been either some failure of the electrical apparatus, or else a misadventure due to the accidental ignition of clothes, or a lamp-wick, or some timber. One of the men who saw the fire gave it as his opinion that the cabin had caught fire. He saw the cables burning, but not sufficiently to induce him to think that the fire had been caused by electricity. The expert witnesses, including Professor Thornston, who was called on behalf of the miners, Messrs. Johnstone and Walker, Divisional Inspectors, and Mr. McLaren, Senior Inspector, were all of opinion that, though it was possible that the fire had been caused by some failure of the electrical apparatus, yet it was more probable that it was due in some way to lights or to lucifer matches. "I agree," writes Sir H. Cunynghame, "in thinking that the cause of the disaster is uncertain, but that it is far more likely to have arisen from the accidental setting alight of some material by a match or otherwise than by electricity. In this connection a question arises whether the electric lighting cables should have been armoured. They would have been better armoured. The question of the legal position as to armouring is a difficult one, depending upon the interpretation of the Act of 1911 and regulations, and I do not propose to deal with it, inasmuch as I do not consider that electricity was the cause of the fire, and, generally speaking, the electrical installation was a good one."

With regard to the telephone installation the report continues as follows:—

"There was a telephone circuit in this pit, consisting of a single wire leading from No. 17 to No. 15, and then down the down-cast shaft, and along the Main Dook Brae. At various points of it telephones were fixed with earth returns. The

circuit did not lead right round to the up-cast shaft. One of the disadvantages of this arrangement is that an accident to one part of the line may throw out of action all the telephones on the rest of the circuit. No telephone message of the fire was sent up. This, no doubt, was because telephonic communication was severed at the cabin. The severance seems to have destroyed communication not only between the Main Dook Brae and the surface, but also between the two pit heads on the surface. If an independent telephone circuit had existed along the return air road, it might possibly have saved all the men in this case. I think that in future telephonic communication should, so far as possible, be independent and arranged so as not easily to be put out of working by injuries to parts of the circuit, and I was glad to hear Mr. Murray, who appeared for the Company, express the same view. I understand that a new telephone system has been devised for use in mines, which will be independent of accidents to the wires. If this turns out to be practicable, it ought to be very useful, and might, in cases of disaster, be invaluable in ascertaining the position of men in the pit, and of assisting in the direction of the operations of the rescue parties."

### AN EXHAUST STEAM COLLIERY GENERATING PLANT

MANNERS COLLIERY, Ilkeston, affords a typical example of the utilisation of exhaust steam which would otherwise have been wasted, and the transformation of the conserved energy into electrical power. Up to the date of the installation of the exhaust steam plant there were about the colliery two winding engines, a haulage and a fan engine exhausting into atmosphere. Power was previously taken from the Nottinghamshire & Derbyshire Power Co., Ltd. To-day the whole of the electrical power in the colliery is supplied from the exhaust steam from these engines, and rarely is live steam called for, except at times when the steam-winding engines are lying idle. The accompanying illustrations give views of the power house which has been laid

FIG. 1.—300-KW. WITTON EXHAUST TURBO-GENERATOR AND SWITCHBOARD AT THE MANNERS COLLIERY, ILKESTON.

out for utilising the exhaust steam. It consists of a 300-kw. Witton-Belliss turbo-generator, generating at 440 volts three-phase 25 cycles, and running at a speed of 1,500 r.p.m. A small reciprocating set comprising a 150-kw. Witton alternator, driven by a Belliss engine at 375 r.p.m., has been installed to take the lighter load at nights and at times when the plant which ordinarily supplies the exhaust steam is not at work. The exhaust steam from each steam engine is fed into a central reservoir consisting of a number of old boilers which have been turned to account. From these old boilers the exhaust main crosses the yard, its suspensions also serving to carry the shaft cables from the power house. The condensing plant consists of a Ledward & Beckett ejector condenser with a spray cooling pond. The circulating pumps are

steam driven. A grease extractor has been installed to relieve the exhaust steam of any oil or grease it may contain. The generators supply power to an open-type marble switchboard, also supplied by the General Electric Co., which includes amongst the usual complement of instruments a leakage indicator and a voltage regulator. The colliery works with an insulated neutral.

Following modern practice, no attempt has been made to

FIG. 2.—GENERAL VIEW OF THE ENGINE-ROOM FROM THE SWITCHBOARD.

give the turbo-generator a high regulation; it has been preferred to design the generator so that the transient current at the moment of short-circuit shall have a low value, and to secure good regulation by the adoption of a voltage regulator which is accommodated on the switchboard. A change-over switch is provided so that the voltage regulator can be made to control either the turbo-generator or the reciprocating set, according to whichever is running. The exciter regulators

are mounted underneath the switchboard, and are controlled by two exciter pillars with concentric handwheels, which permit the exciting current of both generator and exciter to be adjusted. A small cloth filter has been included to filter the air for ventilating the generating sets.

This power station is at present supplying a number of haulages, fans, pumps, a saw mill, shops, stable motors, as well as coal-cutters of both bar and chain types. The power house electrical equipment was supplied by the General Electric Co., of Witton and 67 Queen Victoria Street, London, E.C. Acknowledgments are due to Mr. H. O. Bishop, the Agent and Manager of the Manners Colliery, for the facilities given for taking the photographs, and for permission to publish this description. Mr. W. C. Mountain was the consulting electrical engineer to the colliery for the erection of this plant.

## ELECTRICAL WINDING EQUIPMENT FOR THE RAND

WE learn that the important order for the electrical equipment of the large winding engine for the Rand, referred to in *ELECTRICAL ENGINEERING*, November 13th, page 638, as being made by Messrs. Fullerton, Hodgart & Barclay, has been placed direct by the purchasers, Messrs. The East Rand Proprietary Mines Co., Ltd., with Messrs. The British Westinghouse Electric & Mfg. Co., Ltd. (Trafford Park, Manchester). The winder is capable of raising 8 tons of ore from a vertical depth of 4,500 ft. at a speed of from 2,200 to 2,500 ft. per minute. The electrical equipment comprises two 1,500-B.H.P. 550-volt 33.4-r.p.m. continuous-current motors direct-coupled to the winding drum one on either side. These are supplied with current from a motor-generator set working on the Ward Leonard system, and comprising a 4,200-B.H.P. three-phase 25-cycle 3,000-volt A.C. motor direct-coupled to two 1,375-kw. 550-volt D.C. generators with a direct-coupled exciter for the generators and the winding motors. All the necessary control gear and switchgear are also being provided by the electrical contractors.

Thirty-five other similar installations, comparable in size with the above, have been supplied by the British Westinghouse Electric and Manufacturing Co., Ltd., of which the following are a few examples. Six equipments for the Village Deep and City Deep of the Rand Mines, Ltd., the winding motor for each equipment being of 3,400 maximum b.h.p. Three equipments for the Brakpan Mines, of the Consolidated Mines Selection Co., Ltd., the winding motor for each equipment being rated at 3,000 maximum b.h.p. One equipment for the Great Western Colliery Co., Ltd., South Wales, England, with two winding motors capable of a maximum of over 1,800 b.h.p. each.

**Branch Meetings of the Association of Mining Electrical Engineers.**—At a meeting of the East of Scotland Branch at Dunfermline on November 14th, a Paper by Mr. C. C. Reid, of Cowdenbeath, on the repair and general maintenance of electrical plant in collieries, was read. The author complained that insufficient attention was paid to this department in many collieries, and recommended that a proper electrical stores department should be kept in connection with each colliery, and be under the control of an individual who would be responsible for the stock of spare parts, &c. Proper inquiry should be made into all the breakages of electrical material, and a register should be kept for each motor at the colliery, in which particulars should be systematically entered of each repair and breakdown. A meeting of the West of Scotland Branch was held on the following day at Glasgow, when Mr. J. P. C. Kivlen gave some valuable hints on specification and buying of mining electrical plant.

At a meeting of the Notts and Derby Branch at Chesterfield on Saturday last, certificates were awarded to Messrs. T. H. Williams and E. Barks, and a number of new members were elected. A discussion then took place on Mr. E. Kilburn Scott's Paper on large prime movers and boilers for power houses, originally read before the London Branch. A joint meeting of the Notts and Derby Branch of the Association and the Midland Branch of the Association of Colliery Managers is to be held shortly to discuss the new electrical mining regulations.

The Yorkshire Branch held a meeting at New Monkton Collieries, Royston, last Saturday, when an inspection was made of the surface plant, including the electrical power station, and Mr. J. Bentham, of Sharlstone Collieries, gave a lecture on electrical plant in collieries generally.

**Colliery Electrician Fined.**—George Williamson, colliery electrician, has just been fined 5s. and 16s. 6d. costs for failing to protect some lampholders in accordance with Rule 127 of the Home Office Mining Regulations.

## ELECTRICITY IN MINES

A RECENT paper presented to the American Institute of Electrical Engineers by Mr. H. H. Clark deals with safeguarding the use of electricity in mines. The author points out that, as compared with electrical installations above ground, those underground are temporary in character, and much portable apparatus is used. This condition increases the natural difficulties of maintaining underground electrical equipment in an absolutely safe condition, but in the opinion of the author one of the most influential factors in delaying improvement in underground electrical conditions is the fact that the electrical dangers contribute only a small percentage to the annual death-rate in mines. In the first eight months of 1912 less than three of the men killed in coal mines in the United States met their death as the result of electrical causes. If no other fatal accidents had occurred effective measures to improve the electrical conditions underground would, no doubt, says the author, have been immediately taken. In the category of "electrical equipment that promotes safety" the author places telephones, miner's electric safety lamps, electrical shot-firing, and storage-battery locomotives. The developments of electric safety lamps is only just beginning in the United States, and so far no device has been fully developed and standardised for insuring absolute freedom from gas ignition, but this will no doubt soon be accomplished, so that this type of lamp may become safer than the ordinary safety lamp, as the parts of the latter may be improperly arranged and ignition of gas occur as the result. This has happened on several occasions. The greatest benefits, however, will be had in those mines where the electric lamp supplants the open flame lamp. Shot-firing by properly designed and operated equipment is safer than fuses or other devices that ignite explosives by means of sparks or flames. Finally, the author says that although main line haulage by storage battery locomotives can hardly be advocated at present, the gathering of coal by storage battery locomotives seems, in many instances, to be a feasible proposition. The use of storage battery locomotives would entirely do away with the trolley wire from a large part of the mine entries that are now provided with this dangerous equipment. In addition to the greater degree of safety assured, storage battery locomotives would be more flexible to operate than are cable reel locomotives. The load factor on the generating station would be materially improved, satisfactory voltage regulation of the distributing system could be obtained with less copper, and the expense of installing and maintaining trolley wire and rail bonding would be eliminated in the entries worked by storage battery locomotives.

Mr. F. B. Crosby, in a Paper entitled "Alternating-Current Motors for the Economic Operation of Mine Fans," deals with the seven chief ways of obtaining variable speeds, including (1) constant-speed motors with changeable pulleys; (2) variable-speed motors with rheostatic control; (3) multi-speed windings; (4) concatenation or cascade connections; (5) single cascade motors; (6) dynamic regulation, and (7) brush-shifting motors. Of these the first is described as a make-shift method, while the second, as is well known, has a low overall efficiency. Multi-speed windings for a two to one ratio, the cost of such a motor is only slightly more than that for a single-speed motor, may be used, but for three or four constant speeds, the condition can sometimes be effectively met by two separate windings in the same slots, one or both being arranged for external multi-polar grouping. Three separate windings are not permissible in practical design. Such motors are, however, sometimes used with or without changeable pulleys and rheostatic control.

With regard to the cascade connection, the efficiency remains approximately constant, provided there is no external resistance in the rotor circuit of the second motor, while at the lower speed, the power factor drops, due to the fact that as compared with their normal individual ratings the motors are underloaded when in cascade. With the single cascade motor the stator winding is of the usual full and

half-speed type. The single rotor winding is so arranged that its magnetising effect is the same as would be produced by two separate windings, but all coils which would neutralise each other are omitted in the cascade connection and grouped together for connection to the slip rings for use only at other speeds. When the primary of the first element is properly connected with two circuits per phase in multiple corresponding to the number of poles, these circuits are in exact opposition for the number of poles in the second element, and form a perfect path for short circuiting the secondary of the second element. The stator winding, therefore, carries two currents simultaneously (1) a current from the line at full frequency, and (2) an induced current at a frequency corresponding to the slip. By inserting a variable external resistance between certain points in the stator windings and open-circuiting the collector rings, variable speed control can be obtained for the concatenated connection. Resistance across the collector rings gives ordinary variable speed characteristics for the other two speeds. This type of motor is particularly adapted to the three speeds corresponding to the polar ratios 1, 2 and 3, for example, 4-8-12, &c.

By means of the sixth method shunt speed characteristics can be obtained from standard polyphase induction motors, giving at the same time high-power factor and efficiency throughout the entire speed range. In one way of carrying out this method a compensated commutator motor taking its power from the rotor of the main motor is direct-coupled to a squirrel-cage induction motor connected to the mains, and drives the latter slightly above synchronism and returns energy to the lines depending on the slip of the main motor. Assuming that the main motor is to drive a fan at 50 per cent. of synchronous speed, the horse-power delivered to the fan will be approximately 12.5 per cent. of the rated capacity of the motor, and the same amount of energy will be delivered to the regulating set.

If the connected load required constant horse-power at the motor shaft, then, neglecting losses, the motor input at 50 per cent. speed would be 200 per cent., the shaft horse-power 100 per cent., and the energy returned to the system 100 per cent. If the load required constant torque at the motor shaft, then, neglecting the losses, the motor input would be 100 per cent., the shaft output 50 per cent., and 50 per cent. would be returned to the system. In a modified connection the commutator motor is direct-coupled to the main motor shaft. In this case the slip energy of the main motor is transformed into mechanical energy, and the torques exerted by the two motors are added, thus constant horse-power is maintained at the shaft. For fan service, however, the high-speed self-contained regulating set, says the author, is usually cheaper and yields equally satisfactory results. Also the set may often be applied to any standard induction motor with phase-wound rotor in the event of future rearrangement. The method can be applied so as to give a power-factor correction to the system if required. To start up the induction generator is thrown on to the line through an auto-transformer, and brought up to speed as an ordinary induction motor. The main motor may be started by closing the primary circuit and accelerated by automatic current timing control. Speed adjustments may be made by altering the exciter field rheostat. The range of speed regulation obtained is limited by the maximum frequency impressed on the commutator motor. In general for good design this should not exceed approximately 20 cycles, which will give about 30 per cent. regulation on a 60-cycle motor. This limit varies somewhat with the size of motor involved.

For fan installations requiring motors up to 100 horse-power capacity, in place of the regulating sets described the brush-shifting polyphase motor can often be employed to advantage. Motors can be obtained to give stable operation at speeds corresponding to about 70 per cent. below synchronism. The author thinks that in the absence of any direct-current system, the advantages of the polyphase motor leave small ground for the application of the D.C. motor for either constant or adjustable speed fan-drive.

## ELECTRICAL MINING AND METALLURGICAL PATENTS OF NOVEMBER

THE following Specifications, which have been published by the Patent Office during November, are of particular interest to mining electrical engineers:—

For the regulation of distributing systems subject to large load fluctuations, such as supply systems for winding engines and rolling mills, Patent No. 25,286/12, by the B.T.-H. Co. and C. McCarthy-Jones, provides for a motor-generator and battery in parallel, and a regulator to vary the field strengths of both machines in the set in accordance with the load, so as to cause the motor-generator set to feed the battery or the mains to equalise the load. This is effected by a Tirrill regulator set to vary the field strength of a booster in either sense, according to the load conditions, so that the field strength of one machine is increased, and of the other decreased. In Specification No. 9,682/13, J. O. Thomson describes a signalling circuit for mines where the engine-man awaits signals from both top and bottom of the shaft before he commences winding. A bell circuit comprises, also, an electro-magnet with movable armature, and a star-wheel which is made to operate a visual indicator through another circuit when moved by the armature. The visual indicator is restored to its normal position by a switch. In No. 11,166/13 R. Nelson describes a visual signalling system operated separately from the usual code signals. The level to which it is desired to lower the cage is signalled to the engine-man, and an indication is given at the bottom of the shaft that the cage is about to be used. The gate at the level where the cage stops is unlocked by the engine-man from the engine-house, and when the gate is opened this is indicated to the engine-man. In specification No. 12,813/13, Elektrotechnische Fabrik Schaffler & Co., of Vienna, describes a shot firer in which the rotary handle or lever driving attachment has the driving mechanism so supported as normally to cause the driving axis of the machine to assume an inclined position. In specification No. 14,870/13, Cahucitwerke Nürnberg, of Nuremberg, describes a shot firer in which the driving wheel is keyed directly upon the armature spindle, while the transmitting device is in the form of an extensible helical spring or a cord which is retained in secure engagement with the driving wheel by means of a guide casing.

The following Specifications contain matter of interest to electrometallurgists:—

In No. 21,560/12, T. H. Holroyd describes a motor-driven smelting furnace comprising a wheeled carriage or bed, a cradle mounted on it so that it can be tilted on a vertical plane, and a furnace in the cradle so arranged that it can be revolved. In No. 12,444/13, Cie pour le Traitement des Métaux et des Minerais par l'Electricité, of Seine, France, describes a resistance furnace for the treatment of zinc ores. There are two resistances. The principal one consists of granulated carbon kept in constant shape by pressure, and the secondary resistance is constituted by hollow blocks within which are placed the retorts resting on the principal resistance. The secondary resistance, in parallel with the first, is brought up to the required temperature mainly by thermal conductivity. Its chief objects are to exercise a pressure on the principal resistance and to distribute equally

the heat on to the entire surface of the retorts. The leading-in cables are attached to metal plates in the columns of carbon granules. In No. 12,837/13, Soc. Générale des Nitrures sets out a construction for resistance furnaces in which the resistance element is made up of sector-shaped bricks arranged in alternation or bonding, and maintained by wedging. This is effected by external clamping of the extreme elements, and if necessary at certain intermediate points. The bricks are perforated along their longitudinal axis. The cavity thus formed is filled with badly conducting material. The bricks may also be grooved for this purpose. The complete resistances are used to form the interior wall of cylindrical furnaces. According to M. Perreux-Lloyd's specification No. 6,897/13, copper is produced by the electrolysis of impure copper ores, charged with sulphurous acid, with a rotary cathode and anode of perforated lead or carbon. The anode is horizontal and the anode envelops the cathode so that local couples capable of decomposing the water and depositing black copper sulphide on the cathode are prevented. By keeping the electrodes absolutely parallel, rotating the cathode and agitating the electrolyte a current density of 400-500 amperes per sq. metre can be used. The detrimental action of ferric salts thus becomes negligible.

An arrangement for the automatic regulation of machines for multiple wire drawing, or for cold rolling, having several simultaneous passes, is described by Soc. Anon. des Forges et Acieries de Huta-Bankowa, of Paris, in specification No. 10,901/13. Each driving drum, roller or reel, or each pair of rolls, is driven by a motor whose speed varies inversely as the load. Thus the material being worked affects the speed regulation without binding or slipping.

In specification No. 25,195/12, J. T. Pollard and R. Emmott describe a magnetic separator in which a series of longitudinal soft iron bars are supported at equal distances in a circle by pieces of wood. Thus, when secured, a hollow cage or tube is formed. Near the energising magnets is a stationary ring embracing a portion of the separator, and interrupted at the upper end for a short interval so as to leave a gap, below which is a tray. In No. 8,485/13, H. J. H. Nathorst claims a separator in which the drum is formed of thick iron plate without interruptions, and rotates about a shaft, not partaking in the rotation but rotatable, and forming the fastening of the electromagnets, which are thus adapted to be easily adjusted by means of the shaft. In No. 6,336/13, J. Kraus and E. Oppen describe an electrostatic separator in which the particles are separated by a permanently charged surface. The particles are carried away by a movable dielectric arranged between the attracting surface and the particles.

## METAL FILAMENT LAMP PATENTS

**O**PPPOSITION has just been entered to the grant of two patents relating to metal filament lamps. The specifications were published on October 2nd, and summarised in *ELECTRICAL ENGINEERING* of October 9th, p. 572. They are No. 13,282/12, for the manufacture of ductile masses of tungsten, by P. Schwarzkopf, S. Burgstaller, and Wolfram-Laboratorium Dr. P. Ing. Schwarzkopf Ges.; and No. 12,753/13, for filament supports, by Wolfram-Lampen Akt.-Ges. The opposition to the grant of patent No. 13,282/12 is entered by C. Gladitz & Duram, Ltd., by the Osram Lamp Works, Ltd., and by the British Thomson-Houston Co., Ltd. The opposition to No. 12,753/13 is by the Brimsdown Lamp Works, Ltd.

Patent No. 13,282/12 was applied for on June 5th, 1912, and is for producing a mass of tungsten, molybdenum, &c., of uniformly small crystals suitable for drawing into wires for metal filament lamps. The process consists in the reduction of the oxides of the metals by carbon after they have been consolidated by pressure in moulds. These oxides should be in the form of a fine-grain powder, each particle of which contains a lower proportion of oxygen than the lowest oxide of the particular metal. Sintering is effected at the same time as the reduction by the use of an adjustable current of hydrogen. The rate of removal of the oxygen, in order to regulate the size of the crystals produced, is varied by the addition of an adjustable quantity of an indifferent gas, so that the partial pressure of the oxygen is regulated. At the same time, the rate of flow of the reducing gas and the rate of travel of the pressed material, as well as the temperature, may be regulated. Furthermore, a metal or compound which is not decomposed at the temperature to which the finished body is to be submitted may be added to the pressed material. The action of the added metal (uranium is suggested) is to lower the vapour pressure without substantially lowering the melting-point of the main metal.

The Osram Lamp Works and the B. T.-H. Co. claim that the patent was anticipated by Patent No. 8,031 of April 2nd, 1910, applied for by the B. T.-H. Co. on behalf of the G. E. Co. of America. The claims are for a conductor of ductile metallic tungsten which retains its ductility after prolonged heating. A coarse powder of pure tungstic oxide is reduced by heating the containing vessel in a current of hydrogen for 5 to 15 hours or longer to 1,100° C.-1,400° C. The powder may previously be heated to 1,000° C. for about five hours. Also the powder may be pressed in reinforced steel moulds, and then heated in hydrogen for 10 to 60 mins. to about 1,200° C., so as to produce rods which are heated in a vacuum or in hydrogen to an intense white heat for about 30 mins. The heating may be effected by passing a current through the rods—usually 1,400 amperes for 15 mins., then 1,700 amperes for 15 mins., and then reducing it by about 200 amperes per min. to zero. The rods are then worked, and the surface impurities removed by heating to about 1,000° C. It is also contended that the invention is not sufficiently or clearly described.

C. Gladitz and Duram, Ltd., contend that there is anticipation by Patent No. 12,244 of May 23rd, 1912, taken out by G. Gladitz. This patent describes a construction of press moulds, which permits of pressing the bar in such a way as to avoid the possibility of cracking. The tungsten powder used is of a fluffy character, and the press mould simultaneously and instantaneously releases the compressed bar in all three directions, so that it can expand unrestrictedly.

In its opposition to the grant of Patent No. 12,753/13 to Wolfram-Lampen A.-G., the Brimsdown Lamp Works, Ltd., cites 16 patents as being anticipatory. The patent itself describes filament supports made from about 98 per cent. of oxide of tungsten, and 2 per cent. of thorium oxide. The mixture is reduced in hydrogen, and worked in the usual way to produce a pliant wire. The supports have almost as high a fusing temperature as the filaments, so that fritting or fusing together does not take place. The patents cited as anticipations are Nos. 21,430/93 by C. J. P. Robertson (Robertson's Lamp Works, Ltd.); 28,154/04, 15,462/05, and 5,129/06 by H. Kuzel; 8,499/06 by Deutsche Gaslühlicht A.-G. (Auerger); 18,812/06 by A. Lederer; 24,233/06 and 1,196/07, communicated to the B. T.-H. Co. by the A.E.G.; 20,227/07, communicated to the B. T.-H. Co. by the G. E. Co. of America; 27,710/10 by Lichtwerke G.m.b.H.; 18,467/11 by W. D. Coolidge; 5,026/12, 5,027/12, and 5,028/12, communicated to J. Hubers by Julius Pintsch A.G. The claims in No. 24,233/06 by the B. T.-H. Co. (communicated by the A.E.G.) are for filament supports composed wholly of or having a surface coating consisting of thorium or magnesium oxide containing not more than 2 per cent. of impurities. The holder, after being moulded, is heated to at least 2,000° C., and then chemically treated. The claim in No. 27,710/10 by Lichtwerke G.m.b.H. is for an elastic filament support made of an alloy of molybdenum with a small quantity of a highly infusible brittle metal such as chromium, tungsten, titanium, or vanadium.

**Electric Baths.**—The recommendation that the L.C.C. should apply next session for powers to control electric baths establishments, referred to on page 630 of our issue for November 13th, has been adopted by the Council.

## OBITUARY

**W**E announced briefly last week the death of Mr. James Howden, Chairman of James Howden & Co., engineers and boiler-makers, of Glasgow. Mr. Howden, in his eighty-

second year, succumbed on November 21st to the effects of an operation. A native of Prestonpans, he began his career as an apprentice in the works of James Gray & Co., makers of blowing engines, Glasgow, where he became chief draughtsman. He worked for a time in the office of Bell & Miller, civil engineers, and with Mr. R. Griffiths, well known for work in connection with screw propellers. In 1854 Mr. Howden started for himself, and turned his attention to rivet-making machinery, marine engines, boilers, &c., making many improvements. The old works in Scotland was started in 1862 and was moved to a larger site in the same street in 1871.

JAMES HOWDEN.

From that date onward marine engines and boilers were made for the leading steamship lines, and the Howden hot air forced draught system was developed, and ultimately attracted such a volume of business that the manufacture of marine engines was discontinued. It was in 1900 that Mr. Howden turned his attention to the building of high-speed reciprocating engines for dynamo driving, of which very many were sold. Recognising, however, that the steam turbine would soon take the principal place for high powers, he took up the manufacture of the Zoelly type of turbine, and it is interesting to note that at the time of his death his Company was completing their fourth turbine order for the Manchester Corporation, involving a unit of 80,000 h.p. One of the latest developments of the firm is a branch establishment at Govan for the manufacture of a new water-tube boiler. Associated with him in the management of the business Mr. Howden had his nephew, Mr. J. Howden Hume, and his son, Mr. W. H. Howden. The late Mr. Howden was a member of many engineering societies, to which he contributed a variety of Papers. A man of high moral principle and uncompromising attitude to anything which savoured of expediency or policy which he considered in the slightest degree below his own high standard of rectitude, he had a kindly nature which made him a friend to be desired while an opponent to be feared.

**New Street Lamps in Marylebone.**—We are requested to state that the new street lamp-posts at Baker Street Circus, described and illustrated in last week's *ELECTRICAL ENGINEERING*, page 661, were supplied by the Electric Street Lighting Apparatus Co., of 11 Victoria Street, S.W., to the designs of Mr. Haydn Harrison.

**Finsbury Technical College O.S.A. Annual Dinner.**—The eighth annual dinner of the Finsbury Technical College Old Students' Association was held at the Trocadero Restaurant on November 15th, when a large number were present. Included were Capt. H. Riall Sankey, Professor S. P. Thompson, Professor E. G. Coker, Dr. G. T. Moody, and others. The O.S.A. Bronze Medal for the best Paper read during the session 1912-13 before any recognised engineering or scientific society was awarded to Mr. E. Kilburn Scott for his Paper on "Electric Cables for Shafts in Mines" (*ELECTRICAL ENGINEERING*, March 6th, p. 129).

**Municipal Purchase of Supply Companies.**—A number of corporations are promoting Bills in the next session of Parliament to purchase the electric supply companies operating either in the whole or portions of their areas. Perhaps the most important scheme is the proposal of the Manchester Corporation to purchase the Trafford Park Power Supply, Ltd., although at present the Trafford Park Council is opposed to the proposition. The Leeds Corporation also desires to purchase the Roundhay Electric Supply Co., which supplies in a small portion of the Leeds district, and in this instance there is some difference of opinion among the members of the Council as to the wisdom of the suggestion. The Chiswick Corporation has also given notice of its intention to seek powers to purchase the Chiswick Electricity Supply Co.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,368.

I am putting in motor drives in a sawmill, and should be glad of an idea of the sizes of motors required. One is to drive countershafting with five circular saws on (all push benches without power feed), one 48-in. saw, three 36-in. saws, and one 40-in. saw; and the other to drive two horizontal frame saws and friction hauling gear. The motors will be for continuous current and are to run at about 800 r.p.m.—F. H. G.

(Replies must be received not later than first post, Thursday, Dec. 11th.)

### ANSWERS TO No. 1,365.

When a turbine is running, what are the indications of trouble with the blading?—J. O.

The first award (10s.) is given to "L. F." for the following reply:—

Usually the first indication of blade trouble with a turbine is an increase in steam consumption with a given load. If by any chance some of the blades become damaged, the steam leaks through the gaps in the blading, causing a higher steam consumption with decreased output. If the guaranteed steam consumption is known, any increase should be carefully noted, and after being certain that the condensing plant is in good order, and that vacuum is good together with proper superheat, a test should be arranged as soon as possible on a steady load, and if with all other conditions correct the steam consumption has increased, then the turbine case should be lifted to ascertain the cause. If there is any part rubbing inside, it can be detected by holding the end of a spanner to the ear, with the other end against the turbine case. This test will also reveal the presence of water, a thing which is likely to be fatal to the blades if allowed to collect while the turbine is standing and not properly drained off before starting up.

The second award (5s.) is given to W. H., who writes as follows:—

One of the indications of blade trouble would be vibration of the turbine; it would be impossible to tell, however, whether this was due to some other unbalancing effect, so further tests would have to be applied.

There would be a pronounced hum due to the loosening of the blades, if this were the trouble, and blade trouble of any kind would result in a considerable increase in steam consumption together with a tendency to fall away in speed on high loads or overloads. Serious blade trouble caused by loosening of the blades may also make its presence felt by wrecking the turbine, or at any rate stripping the remainder of the blades.

Neither of these replies are really complete. The signs of trouble that should be mentioned are rise in steam pressure at intermediate stages, increased steam consumption, noise and vibration.

### ANSWERS TO CORRESPONDENTS

H. J. F.—(A) 4.5 volts. (B) 1.5 volts. (C) The capacity in ampere hours will depend on the size of the cell.

## STUDENTS' "RAG" IN A SUB-STATION

THE two students who were involved in the attempt to switch off the electric light in the Albert Hall on the occasion of a meeting addressed by the notorious James Larkin, as reported in our issue for November 27th, page 665, were again before the Westminster magistrate on Friday. When the case came on, Mr. Dutton, on behalf of the Kensington & Knightsbridge Electric Lighting Co., said that, having considered the position, the Company was prepared, with the magistrate's consent, to withdraw the charge. The two defendants, he said, were young men who were struggling to pass through their examinations, and it was not desired to do anything now which would in any way interfere with their future career. It was clear that the mob of which they admittedly formed a part had not premeditated doing damage to the sub-station, notwithstanding the fact that damage to the extent of £22 9s. was done. This, however, the parents of the defendants were prepared to make good.

On behalf of the defendant Macallum, it was stated that he is an engineering student, and that his version of the affair was that he found himself forced into the sub-station with the crowd, and, being the last one to get out again, the authorities were able to detain him. The sole intention of the students, said his solicitor, had been to go to the Albert Hall to sing "God Save the King," as they objected to a man like Larkin going round the country "damning the Empire" as he had done. Loyalty, added the solicitor, had not yet been held to be an actionable offence.

Mr. Horace Smith (the magistrate) said he thought the decision of the Electric Lighting Co. was a happy and reasonable termination, and the defendants should consider themselves very fortunate in escaping in the manner they had done. He could not refrain from remarking, however, that there had in this instance been folly so great as to amount to positive wickedness. On the understanding that the amount of damage and costs would be paid, he discharged the defendants.

**Cable Explosions with Bitumen.**—The Board of Trade have appointed Sir T. Edward Thorpe, C.B., F.R.S. (Chairman); Mr. Robert Nelson, of the Home Office; Mr. W. Slingo, of the General Post Office; Mr. James Swinburne, F.R.S., and Mr. Alexander P. Trotter, of the Board of Trade, to be a Committee to consider the causes of explosions which have occurred in connection with the use of bitumen in laying electric cables, and to report as to any steps which should be taken to prevent explosions in future from the use of bitumen or similar substances. Mr. M. J. Collins, of the Board of Trade, will act as Secretary to the Committee.

**The Motor-cycle Exhibition.**—At the recent Motor-cycle Exhibition at Olympia, there was on view the first make of motor-cycle to be fitted with electric starter and complete electric lighting equipment and horn. The machine is the "Indian." A variable speed self-regulating four-pole dynamo is used in conjunction with two sets of accumulators connected for charging at 7 volts and for starting at 12 volts. The capacity is given as 70 and 35 ampere-hours respectively. When used as a motor for starting, the h.p. rating is given as 1.5. As a dynamo it begins to charge at 12 m.p.h. on high gear, and 8 m.p.h. on low gear. The maximum is reached at 16 m.p.h. on high and 12 m.p.h. on low gear. The charging is regulated by an external regulator and circuit breaker. The accumulators are contained in a case fixed to the frame under the saddle, and are used in conjunction with coils for the ignition. The lighting equipment may be obtained without the starter. Another lighting set was shown on the Motosacoché, but this was not so complete. A larger number of electrical accessories than usual was also on view at the stands in the gallery.

**The Research Committee of the Institution of Electrical Engineers.**—Arrangements are being made by the Research Committee for the investigation of the properties of tungsten and other magnet steels, the effect of heat treatment and other matters of importance in the manufacture of permanent magnets. Other subjects of investigation which are to be taken in hand are the chemical and physical properties of insulating oils, and the determination of the temperature rise in, and the permissible current density for, buried cables. These announcements are made in the issue of the Journal of the Institution of Electrical Engineers for December 1st, which also contains the full text of Mr. Duddell's inaugural address on pressure rises, illustrated by diagrams, abstracts of the Chairman's addresses at six local sections, and the Papers by Mr. S. H. Holden on standard meter specifications, and by Mr. H. H. Perry on a new tariff system.

**The Batti-Wallahs Journal.**—The quarterly journal of this energetic society contains interesting accounts of a week's sailing barge trip and a visit to the *Olympic* at Southampton by parties of members. These and other personal notes make it very evident that the society is flourishing, and that its members enjoy life.

### ELECTRIC TRACTION NOTES

It is stated that the Kearney High Speed Railway Co., which had intended to apply for Parliamentary powers to construct a tube railway on this system to the Crystal Palace, has abandoned the idea, first because the Company has been invited to prepare estimates for a short length of line in one of the large provincial towns, and secondly because the Baker Street & Waterloo Railway Co. intends to apply for powers to run to the Crystal Palace, it being felt that this latter will seriously infringe the prospects of the Kearney Co. before its system has been fully demonstrated.

The York Corporation is considering the use of trailer cars to meet the rush-hour traffic.

The Baker Street and Waterloo Railway terminus at Baker Street has now been connected up with the Paddington terminus of the Great Western Railway. The interesting feature about the extension is the provision at Paddington of what is claimed to be the largest escalator in use. This consists of two moving staircases and one stationary, the moving ones having a carrying capacity of 10,800 people per hour each. The equipment is such that for dealing with rush traffic in any one direction, the second staircase can be reversed so that 40,000 persons can be moved in one direction. The Superintendent of the London Electric Railway Co. is credited with the statement that the Company will not erect any more lifts at new stations.

The Irish Local Government Board a short time ago surcharged the sum of £2,800 distributed among the Belfast tramway employees under a profit-sharing scheme. Strong protest was made, and the Board has now decided to remit the surcharge, stating that it was made in such circumstances as to make remission fair and equitable.

### TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Some interesting trials are being made by the British and German Post Offices in connection with telephony between London and Cologne through the Anglo-Belgian cable. Speech has also been transmitted between London and Berlin. In these trials use has been made of the S. G. Brown and also the Lieben Reisz telephone relays. We hope to return to this subject in an early issue.

The Hull Corporation shares with the Portsmouth Corporation the distinction of possessing the only two municipal telephone systems in this country, but whereas the Portsmouth licence expires in 1926, the Hull licence expired on December 31st, 1911, simultaneously with the expiry of the National Telephone Company's licence. Since then negotiations have been proceeding with the Postmaster-General as to the future of the Hull municipal service, and an exceedingly strong feeling exists in the town that the Corporation should continue. These negotiations have at last culminated in an offer from the Postmaster-General to sell to the Hull Corporation the present Post Office system there, recently acquired from the National Telephone Co. The terms of the purchase are the payment of the sum of £192,423, the figure at which the undertaking was acquired from the National Telephone Co., at the same time granting the Corporation a new licence for 21 years. The Corporation is also to have a free hand in fixing rates. The outstanding feature of the Hull system has been the low charges made, which, of course, would be increased if the Post Office took over the municipal system. The Telephone Committee has been very seriously considering this offer from the Postmaster-General, and has decided to recommend the Corporation to accept it. The result would be some slight increases in the rates, which, however, will not be so great as if the Post Office took over the municipal system, and taking into account these increased charges it is estimated that after paying capital charges on

the purchase price there will be a profit of £5,330 per annum. A point which the Committee make much of in the recommendation is that the National Telephone Co. was, by the municipal competition, forced to keep its equipment in first-class condition, probably, it is suggested, in better condition than in any other town.

The development of wireless apparatus, and the arrangement of circuits, was dealt with by Mr. J. St. Vincent Plette, A.C.G.I. (Chief of the Patents Department, Marconi's Wireless Telegraph Co., Ltd.), in his fourth lecture at the City & Guilds (Engineering) College, on Thursday last. With the advent of larger powers, he explained, the question of sparking at the signalling key became very important. The difficulties were reduced by shunting the key and break with condensers, and by the use of the magnetic key in which there are two sets of contacts. The current to be broken passes round an iron core which has a vibrating armature and make-and-break contact, with the signalling contacts in parallel; thus the break always occurs at minimum current. The signals were slightly prolonged, but it was found that little difference was experienced in practice in the rate of signalling. At the present time still greater powers are necessary, and magnetic blow-out keys and revolving disc dischargers are used. The well-known skin effects with high frequency currents are particularly noticeable in wireless apparatus. For straight conductors a plank coated with zinc forms a good and cheap conductor. For the primary coils of jigger transformers, however, a number of small wires, generally six, are stranded round a hemp cord. A number of these composite conductors are then wound helically round a circular wooden former of large diameter. It is arranged that there is one complete twist per turn, so that every individual wire takes up every position relatively to the secondary. The primary jigger of the transformer for transatlantic signalling has one-and-a-half turns. As this coil is movable it is seen that the plate form of conductor would not give a uniform distribution of current. Although glass plate condensers take up less space than air condensers, they have their disadvantages, as, should a breakdown occur, they are not self-sealing. The condensers at Clifden are of the air type. The plates, which number 1,820, are each about 12 ft. wide by 80 ft. long. They are suspended from the roof of a building 350 ft. long, at distances about a foot apart. The capacity is 1.8 mfd. The two most used detectors at the present time are the magnetic band detector and the Fleming valve. Crystal detectors are also used to some extent, carborundum being quite common. The greater the difference in structure between the two sides of the crystal, the better will it work. Very often even a piece of hard coal between two spring contacts will give quite good results. With regard to the arrangement of circuits, the addition of a third one between the aerial and the detector enables tuning to be more accurately accomplished, and therefore greater selectivity obtained. By loosening the coupling, the effects of atmospheric disturbances can be reduced, while the strength of the signals is only very slightly impaired. The next lecture will be given to-day at 5 p.m.

The line between Bagdad and Bassora was down for a short while on November 25th, and on the 30th ult. communication with Cassinga (Angola) was again re-established.—The Compagnie Française des Cables Télégraphiques restored the Puerto Plata-Martinique section on the 2nd inst.—The Cape St. Jacques-Pontianak cable failed between Poulo Condore and Pontianak on the 2nd inst.

**An Electric Power Company's Development.**—An interesting feature of the proposed Bills in the next session of Parliament is the notice given by the Yorkshire Electric Power Co. to apply for powers to supply electricity in detail in those districts in its area or where the local authority at present has not an electric lighting provisional order.

**Electric Ambulance Service for London.**—The Metropolitan Asylums Board proposes to incur an expenditure of £18,680 in the establishment of an electric ambulance service throughout its area, similar to that now in use in the City of London. The London County Council is to bear a portion of the expenditure.

## "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

### Specifications Published November 27th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

(Names in italics indicate communicators of inventions from abroad.)

22,355/12. **Waterproof Cables.** C. J. BEAVER and E. A. (Glover and Co.) CLAREMONT. The dielectric is surrounded by a conducting material, while outside of this, again, is a thin layer of hygroscopic insulation. By this means small defects in the sheathing can be detected on making the waterproof test. Two figures.

22,488/12. **Ship's Telegraphs.** S. C. ALLISON and A. S. LINDSAY. To record the transmission of messages by ship's telegraph, the deflection of a recording instrument is regulated by different combinations of the cells of a battery and resistances through contacts by a brush worked by the pointer of the telegraph instrument. Two figures.

22,546/12. **Domestic Hot-water Supply.** A. F. BERRY. The heating is effected in the ordinary hot-water tank if it is suitably lagged, or a special tank may be used. Valves are provided so that the coal-fired boiler may be put into use or not. The control is effected by a yielding member, which is first displaced against a stop as the temperature rises, and then liberated, so that it can spring forward and open the switch. A similar contrivance is used to close the switch. By additions a graduated heating may be provided. Two figures.

25,310/12. **Refractory Insulating Material.** B.T.-H. Co. (G.E. Co., U.S.A.). Silica, carbon, and rutile are heated in an electric furnace until reduction takes place. The sublimate is condensed. A mixture consisting of 15 parts silica, 12 carbon, and 20 rutile, treated in a "smothered arc" furnace, is claimed. The sublimate has a flaky, laminated structure, and contains silicon, carbon, oxygen, and titanium. Its apparent density varies from 0.06 to 0.16, and the real density is about 2.56. Two figures.

1,036/13. **Synchronous Running of Cinematograph and Gramophone.** G. W. FORD. A three-pole motor is controlled by a separate commutator. This has a bracket revolving about its axis supporting two brushes; one connects with the outer circuit through its support, spindle, and bearing, while the other is insulated, and has a collecting ring and brush. The commutator is worked by the cinematograph lantern, and the motor works the sound-reproducing instrument. Six figures.

1,340/13. **Incandescent Lamps.** NAAMLOOZE VENNOOTSCHAP PHILIP'S METAAL GLOEILAMPENFABRIEK. To remove the last traces of gas in incandescent metal wire lamps, the filament on the reel is coated with phosphorus or dipped into a bath of liquid containing phosphorus as it is unwound from the reel.

3,057/13. **Ignition.** G. E. HEYL and T. T. BAKER. Separate spark plugs in each cylinder are energised by separate secondary windings, which are themselves energised by a common primary. This constitutes an inductance in an oscillatory circuit energised by an induction coil or high-pressure magneto controlled by the engine. One figure.

6,036/13. **Rectangular Stranded Cable.** A.-G. BROWN, BOVERIE. To minimise the effect of eddy currents in the conductors for heavy-current machinery, the conductor is made up of groups of component conductors. The conductors of each group are intertwined by crankings, and the groups are twisted together by assembling at the cranked places. Six figures.

15,149/13. **Double Pressure Traction.** SIEMENS DYNAMO WORKS, F. LYDALL, and C. E. FAIRBURN. In order to change automatically the connections on a railway or tramway vehicle for working at, say, 1,200 and 600 volts, it is provided that when the vehicle enters a section where the two pressures overlap, the circuits are rearranged by an electromagnetic switch, which is excited from the low-pressure supply in opposition to a spring tending to hold it in the other position. The exciting current is broken by a relay, itself excited from the high-pressure supply. Another relay, excited only by the low-pressure supply, in turn de-energises the high-pressure relay, while an auxiliary high-pressure relay has its circuit closed on the de-energisation of the low-pressure relay. This auxiliary relay then breaks the circuit of the low-pressure relay on being energised. Two figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials.** &c.: B.T.-H. Co., GARTON and WATSON [Regulation] 27,235/12; B.T.-H. Co. (G.E. Co., U.S.A.) [Distributing] 5,961/13; EARL

[Distributing] 9,278/13; METAL JOINTING Co. and HARDEN [Bulkhead fittings for metal sheathed cables] 9,752/13.

**Electrometallurgy and Electrochemistry:** WALLACE and WASSMER [Metals by electrolysis] 18,449/12; LEE and BRAME [Cleaning, electro-plating, and finishing] 26,255/12 and 26,504/12; B.T.-H. Co. (G.E. Co., U.S.A.) [Ozonators] 4,575/13.

**Ignition:** MOORE and AMBROSE SHARDLOW & Co., 3,487/13; NORRS and DODSON, 8,584/13.

**Incandescent Lamps:** ROBIN, 26,186/12; B.T.-H. Co. (A.E.G.) 27,432/12.

**Instruments and Meters:** MASCALL and CHAMBERLAIN & HOOKHAM [Meter counting trains] 16,344/13.

**Switchgear, Fuses, and Fittings:** FROGER [Dynamo pressure regulators] 26,893/12; HIRST and BROOK [Motor controllers] 28,635/12; SMITH [Ceiling roses] 534/13; ELEC. SIGN Co. and DICKSON [Automatic switches] 4,591/13; SOC. ANON. APPAREILLAGE GARDY [Fuses] 4,686/13; HODGSON [Candle fittings] 6,901/13; FROST and WRIGHT [Time switches] 9,881/13; WEISSBERG [Fuses] 11,298/13; FREITAG [Switching for the inside lamps of automobiles] 14,306/13; BLOXAM [Bosh] [Cable sockets] 16,709/13; BOYD and TANNERHILL [Fuse] 19,551/13.

**Telephony and Telegraphy:** SIEMENS BROS. & PETTIGREW [Telephone selectors] 818/13; MARCONI Co. and FRANKLIN [Aerials] 4,514/13.

**Traction:** PEACOCK [Power generators and recuperators for motor-cars] 13,936/13.

**Miscellaneous:** SAUVEUR [Bells, &c.] 26,280/12; RUSHTON [Secondary clocks] 26,309/12; ROSENBERG [Miner's safety lamp] 28,772/12; MAJOR and SMITH, MAJOR & STEVENS [Locks for lift gates] 29,778/12; RIDEAL and EVANS [Use of polarising and depolarising effects on an electric couple for estimating] 1,776/13; MANCHESTER and SPOONER [Primary batteries] 2,693/13; HITZELBERGER and NEW BRITISH EVER-READY Co. [Portable lamps] 13,175/13; SCHON [Heat insulating compound] 14,058/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Electrometallurgy:** KELLER [Furnaces] 20,371/13.

**Ignition:** KOPF [Spark plugs] 18,727/13.

### Opposition Entered to Grant of Patents

13,282/12. **Manufacture of Ductile Masses of Tungsten, &c.** P. SCHWARZKOPF, S. BURGSTALLER, and WOLFRAM-LABORATORIUM DR. INBIG P. SCHWARZKOPF. The opposers are C. Gladitz and Duram, Ltd., the Osram Lamp Works, Ltd., and the British Thomson-Houston Co., Ltd. See also page 684.

12,753/13. **Filament Supports.** WOLFRAM LAMPEN A.-G. The use of an alloy of tungsten and thorium is claimed. The opposers are the Brimsdown Lamp Works, Ltd., which cites 16 patents said to anticipate No. 12,753/13. See also page 684.

### Application for Restoration of Lapsed Patent

14,495/06. **Railway Signalling.** W. REID. Application has been made by W. REID and THE AUSTRALIAN SIGNAL CONTROLLER Co. PROPRIETARY, LTD., for restoration of this patent, which has been allowed to lapse. A locking gear is described. Any opposition to the restoration must be made before January 26th, 1914.

### Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** VERITY's and F. S. WORSLEY [Vertical carbon clutch lamps] 17,621/04.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** O. SCHALLER [Pressure regulation on system supplied from generators running at variable speeds] 16,781/07; FRENCH WESTINGHOUSE Co. and R. BRUN [Control of compound-wound flywheel sets for winding engines, rolling mills, &c.] 16,986/08.

**Dynamos, Motors and Transformers:** C. A. and G. L. PARSONS [Insulating turbo-dynamo commutators] 16,911/08.

**Electrochemistry and Electrometallurgy:** C. M. HALL [Production of alumina from bauxite in electric furnace] 14,572/00.

**Ignition:** I. ZUBALOF [Electromagnetic control] 16,668/03.

**Telephony:** J. E. KINGSBURY (W. E. Co., U.S.A.) [Automatic exchange] 17,209/08.

**Traction:** K. DE KANDÓ [Roller contacts for overhead collectors] 14,367/00.

**Miscellaneous:** W. D. JUDKINS (M. R. Hutchison, U.S.A.) [Vibrating horns] 18,070/06; J. R. CALVERT [Electro-medical appliance] 18,092/06; W. FAIRWEATHER (Brown Hoisting Machinery Co., U.S.A.) [Electrically-driven double-chain grabs] 18,257/06; J. T. SZEK [Primary cells] 18,082/07; L. V. E. RICHARDS [Measuring fabrics] 16,760/08.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 691. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**HOLOPHANE.**—Revised price-lists of Holophane fittings for spheres, reflector bowls, semi-indirect bowls, &c., have just been issued by Holophane, Ltd. (12 Carteret Street, Queen Anne's Gate, S.W.). Besides the several fittings for various purposes, there is a good selection of screw and spring clip galleries suitable for the different styles of fitting. Some glassware has also been re-priced. The new prices came into force on Monday last.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**LAMP HOLDERS.**—A card from the Metallic Seamless Tube Co., Ltd. (Meta House, Corporation Street, Birmingham), brings to notice the company's "Star" high-voltage key-type lamp holder and the pull-chain switch holder now largely used. Reduced prices are now quoted for the "New Model" lamp holder, with insulated dome, introduced some five years ago.

**ELECTRIC SUPPLY ADVERTISING.**—We have received copies of postcards, small folders, &c., from the City of London Electric Lighting Co., Ltd. (1 and 2 Great Winchester Street), calling the attention of consumers to electric heating, ozone air purification, and vacuum cleaning.

**METAL FILAMENT LAMPS.**—A card inscribed "Right in the Public Eye," and bearing a large representation of a human eye, has been sent us. On deflecting a little tab at the side, we found that the iris and pupil of the eye disappeared, and a neat advertisement of Osram lamps was revealed. The back of this card can be overprinted by the General Electric Co. with local contractors' names and addresses.

**MERCURY VAPOUR LAMPS.**—A leaflet from the Westinghouse Cooper Hewitt Co., Ltd. (80 York Road, King's Cross), calls attention to the application of mercury vapour lamps in the textile trades.

### DUST-TIGHT LIQUID STARTERS

A NEW design of liquid starter has recently been manufactured in large quantities by the General Electric Co., of Witton and 69 Queen Victoria Street, London, E.C.,

FIG. 1.—400-H.P. LIQUID STARTER.

in connection with a number of complete installations for flour mills, cement works, and other cases where the exclu-

sion of dust is important. In this starter the cast-iron tanks which contain the electrolyte are mounted on a steel framework, the supporting bars being completely covered with moulded micanite. In view of the proximity of moisture, special attention has been paid throughout to the insulating arrangements; indeed, all tie bars that are required for mechanical strength are insulated throughout their whole length. The plates are lowered into the liquid by the rotation of a handwheel. The gearing between the handwheel and the plates is very substantial, and the gear ratio is high. A rapid motion of the handwheel therefore only lowers the plates into the liquid slowly, and it is impossible for the plates to descend by reason of their own weight. For completing the circuit between moving and stationary parts, each phase or pole is provided with heavy contact blocks, in addition to sparking rollers, which protect the contacts in the event of the starter plates being raised while the motor is running without its slip-rings short-circuited. In view of the importance of keeping down the head-room of liquid starters for colliery work, the larger sizes of starters have been designed with two tanks in parallel per phase or

FIG. 2.—CONTINUOUS-CURRENT LIQUID STARTER WITH FIELD DISCHARGE RESISTANCE.

pole, and a considerable reduction in the head-room is thereby effected. The whole of the internal arrangements are thoroughly protected, and enclosed by sheet-steel covers. These covers entirely enclose the starter, rendering it dust-tight, and they afford protection against rough handling. The top cover may have in addition an inspection door on each pole, through which the internal arrangement can be inspected and the tanks filled. For continuous-current work with shunt or compound-wound motors a non-inductive field discharge resistance can be accommodated in the bottom of the starter. These are mounted on porcelain insulators in the fashion shown in Fig. 2. That these starters have filled the demand is evident from the fact that over 5,000 h.p. have been ordered for cement works alone.

**The Electrical Co., Ltd.**—We have received from the Electrical Co., Ltd. (122-124 Charing Cross Road), the following interesting statement of the progress of the machine department of their works:—

	1910-11	1911-12	1912-13
Machines built above $\frac{1}{2}$ h.p.	92,186	118,205	122,452
Total kw. ... ..	1,756,001	1,861,344	1,973,987
Kw. of turbines ... ..	294,017	469,942	559,908
Total kw. ... ..	2,050,018	2,351,286	2,533,895

They also tell us that over 214 gas works are using their electric motors for various operations involved in the production of gas, and that these aggregate 35,000 h.p.

**STREETLITES**

and other Lanterns and Fittings  
are the speciality of the—

**WARDLE** ENG. Co., Ltd., 196, DEANSGATE,  
MANCHESTER.

London: Nathan & Allen, Queen Ann's Chambers, S.W.

### TWO WELL-LIGHTED CINEMATOGRAPH THEATRES

THE British Thomson-Houston Co. (Mazda House, 77 Upper Thames Street, E.C.) claim that the electric lighting schemes of the Carlton Theatre, Tottenham Court Road, and the Balham Palladium, Balham High Road, are representative of all that is best and most up-to-date in cinema equipment, although the systems in use are different. The

FIG. 1.—CARLTON THEATRE, TOTTENHAM COURT ROAD.

main illumination in the auditorium of the Carlton Theatre is provided by four "Eye-Rest" fittings suspended equidistantly around the central dome, and these are equipped with Mazda "X-ray" reflectors. The bowls are 24 in. in diameter, and are of moulded composition. A part of the raised ornamentation on the bowls is picked out in gold in order to harmonise with the surrounding decorations. In

addition to the indirect lighting, a certain number of direct units are used, but as these are fixed right up against the ceiling (excepting in the case of the gangway lights), they do not cause any discomfort to the eyes of the audience.

The Balham Palladium lighting is carried out on a different system, which has not hitherto been employed very largely in cinemas. Direct diffused lighting is employed. Four beautiful fittings specially designed for the purpose, each equipped with a central 16-in. Alba glass sphere and four 6-in. Alba balls, are suspended from the four corners of the large panel in the ceiling. The big sphere in each fitting contains a 200-watt Mazda lamp, and the small Alba balls contain 60-watt Mazda lamps. The lamps, of course, are entirely enclosed by the white

FIG. 2.—BALHAM PALLADIUM.

Alba glassware, and the illumination is well diffused. The Balham Palladium has a beautiful painted ceiling, and the lighting here was designed to illuminate this ceiling. The vestibule, corridors, staircases and offices are lighted by means of wall brackets or pendants fitted with Mazda lamps and Veluria reflectors. The auditorium illumination is controlled by a B.T.-H. metallic dimmer, which gives the necessary gradual adjustment of the light. The outside lighting is very striking. The name of the theatre is formed by lamps in a special trough reflector—the letters being about 2 ft. high. In addition to this, the whole building is outlined with strip light, and there are five flambeaux standards on the roof. In all, about 200 20-watt and five 100-watt Mazda lamps are used for the outside lighting.

### REMOTE CONTROL CIRCUIT BREAKERS

WE are now able to give some further information as to the construction of the clapper switch circuit-breaker referred to last week in *ELECTRICAL ENGINEERING*, in connection with the illustrated description of the "Igranic" motor control panels. These breakers are made by the Igranic Electric Co., Ltd. (147 Queen Victoria Street, E.C.), and form an integral part of many "Igranic" appliances. The current-carrying contacts consist of a laminated phosphor-bronze brush, pressed against a hard rolled metal surface. This construction eliminates the danger of partial contact, for whenever contact is made at all it must be over the whole surface. Furthermore, the contacts are always clean, because each time that the switch closes the flat contact surface is slightly scraped by the edges of the leaves of the laminated brush as they expand. These current-carrying contacts are reinforced and protected by easily renewable circuit-breaking contacts of carbon of large size, and so disposed as to always make contact before the metal contacts, and break after them. The pole-pieces of the blow-out magnet swing up to permit easy inspection of the contacts. Their normal position is such that the break always takes place in the most intense portion of the magnetic field.

**Osram Lamp Patents.**—The Osram Lamp Works, Ltd., announce that actions have been commenced against Harraway Bros., Kensington, for selling lamps manufactured by Pope's Electric Lamp Co., Ltd., and against The Maxim Lamp Works, Ltd., for selling Maxim Lamps. It is alleged that the lamps in question infringe the Osram patents Nos. 23,899/04 and 18,622/06. The Pope company announce their intention of fighting the case against them to the highest court, and reassure their customers as to their indemnity guarantee.

## CASING AND CAPPING

WE have received a number of replies to the inquiry made by Messrs. C. Jennings & Co. last week whether the trade prefers casing made for the capping to screw on at the centre fillet or at the edges.

Messrs. Rashleigh Phipps & Co. (147 Oxford Street, W.) say that during the past twenty-five years they have found the existing practice satisfactory of screwing the capping in the small sizes to the centre fillet, but in casing over 2 in. in width to the side fillet.

Messrs. E. Troy & Co. (194 Finchley Road, N.W.) from an eighteen years' experience screw on to the centre fillet in sizes up to 1½ in., but in larger sizes screw on to the outer edge to prevent gaping. They do not think it advisable to reduce the distance between the grooves.

Messrs. Thomas Hyde & Co. (Croydon) also prefer to screw on in the centre of 1½ in. casing, but suggest that this size be made 1/16 in. deeper in the grooves than the customary standard, so as to allow for two wires in each. For 2 in. casing they prefer screwing on the outer edges, increasing the width of these slightly and reducing the centre fillet.

Messrs. James Meighan & Son (Glasgow) and Messrs. Robson & Coleman (Newcastle-on-Tyne) also recommend the retention of the practice of screwing the 1½ in. casing in the centre and screwing the larger sizes on the outer edges. Messrs. Meighan point out the risk of careless men bursting the outside fillets if the capping were screwed on to the edges on the smaller sizes.

Electrical Installations, Ltd. (27-28 Martin's Lane, E.C.) write:—"The general procedure for sizes above 2½ in., on account of the tendency of the capping to gape open, would be to fix with screws on the outside edge." In the particular case of 1½ in. casing, we cannot see that any good is to be obtained by thickening up the outside edge at the expense of the middle fillet. There is no doubt that in practical use it would be almost impossible to fix the casing to the wall on the outside edge, and the chance of splitting when the screws are driven through the middle would be greatly increased if this centre fillet is diminished in size. The whole difficulty of gaping open has been eliminated by us by the use of 'hospital' type of capping, which has a thickness of about twice the usual capping in the centre where the screws would be fixed, and we cannot see that any improvement could be made on the standard practice of using this capping." [In this, the edges of the capping are rounded off instead of being square.]

The manager of the electrical department of one of the largest firms of builders, on the other hand, expresses his personal opinion that it is best to have the casings of the smaller sizes with a thicker timber on the sides, so that the capping can be screwed at the edges; the thickening of the sides will reduce the centre fillet, but this, he thinks, does not matter. Of course, in the larger sizes there is plenty of margin of timber to get a good screwhold. He also suggests that the cappings should be reeded in such a manner at the edges that the wireman can easily get a centering for his screw hole into the middle of the timber sides; they so often, he says, make a "boss shot," and put the screw holes so near the edge that the wood splits and leaves an unsightly job.

**The New American Duty Tariff.**—Messrs. Davies Turner & Co. (52 Lime Street, E.C.) inform us that they are still receiving inquiries from manufacturers and others showing that many business houses are still unfamiliar with the duties now payable on the goods in which they are concerned. They ask us to state that they still have a certain number of copies of their pamphlet on the subject left, and would be pleased to supply these free of charge to anyone who applies.

**"Mazda House News."**—The second issue of this periodical of the British Thomson-Houston Co. (Mazda House, 77 Upper Thames Street, E.C.) fully upholds the reputation established by the first. Among the special subjects treated are church lighting and illuminated hoardings, and there is a most interesting article on advertising, illustrated by miniature reproductions of a selection of blocks which the company are willing to lend contractors to assist them in their own campaigns. There are several effective photographs of installations carried out on the "eye-rest" indirect lighting system, and an announcement is made regarding reductions in prices of Veluria Glassware, which should increase still more the use of these already well-appreciated reflectors. The technical and commercial information is well lightened by humorous contributions, and the whole magazine, with its bright illustrations, has a pleasant air of life and vigour.

## MODERN ENGINES AND POWER GENERATORS.

By Rankin Kennedy, C.E.

The Coupon below entitles any reader to a complimentary copy of an illustrated booklet, describing what is probably the most valuable work upon this subject ever published.

The importance of the subject is growing day by day, and "The Book of Modern Engines and Power Generators" can easily prove of the greatest value to those who desire to be fully informed upon the latest developments in every branch of the subject.

The author, Mr. Rankin Kennedy, C.E., is well known as an authority on his subject, and in this work he explains in the clearest and most thorough manner the design and construction of prime movers; the term is here used in its widest sense, as it applies to all engines, whether worked by petrol, oil, steam, air, gas, water, or electricity, and as it includes all machinery and processes connected with power generators and distribution.

### ENTIRELY UP TO DATE.

Moreover, all these subjects have been brought entirely up to date. The previous Edition of the work achieved such an immediate success, that for the new and Revised Edition, the scope of the work has been widened and extended so as to cover every branch of the subject, by the addition of a great amount of new matter, and many new illustrations of very great interest and high value.

This new Edition is indeed already recognised as the standard work on its many varied subjects, including Rotary Engines, Gas Turbines, Gas Engines, Oil Engines, Petrol Engines, Suction and Producer Gas Engines, Blast Furnace Gas Engines, Marine Engines of every design and type, Compressed Air Motors, Air Compressors, Refrigerating Engines, Windmills, with electric storage, Fluid Hydraulic Engines, Water Pressure Engines, Hydraulic Rams, Water Pressure Turbines, and Water Raising Engines, Centrifugal Pumps and Air Lifts, Power Distribution and Transmission by Gearing, Water Pressure, Compressed Air and Electricity, etc., etc.

### OVER 2,000 ILLUSTRATIONS.

The work is profusely illustrated by diagrams, text-cuts, and plates. In all there are over 2,000, every one of great practical utility to the engineer.

Enough has been said to show that this work is indispensable to all electrical, mechanical, steam, and hydraulic engineers, and to all who are concerned with manufacturing, designing, draughtsmanship, electro-chemical, and metallurgical work, with automobiles, tramways and railways, boilers, shipbuilding, collieries and mines, etc.

We would advise those who are determined to keep abreast with all the latest specialist knowledge concerning every detail of their profession to send for the free booklet which is supplied by the publishers to those mentioning this paper.

## A FREE BOOKLET.

To the CAXTON PUBLISHING CO., LTD.,

97, Surrey Street, London, W.C.

Please send me, free of charge, a copy of the book describing the "Book of Modern Engines and Power Generators," and showing how it can be obtained for a first payment of 1s. 6d., the balance to be paid by small monthly payments.

### A STRIKING SHOW-CARD

We give here an illustration of the latest Osram lamp showcard now being issued by the General Electric Co., Ltd. (87 Queen Victoria Street, E.C.), which is the work

of one of the most eminent poster artists of the day. We are asked to state that copies will be supplied free to all electricians, ironmongers and stores upon application.

**Anglo-American Exhibition, 1914.**—We have received some particulars of the Electrical Engineering Section of the Anglo-American Exhibition which it is proposed to hold at Shepherd's Bush next year. A large Electrical Committee has been formed, of which the following form the executive committee: Messrs. W. H. Mordey (Chairman), R. Hammond (Vice-Chairman), H. R. Kempe (Hon. Secretary), W. Worby Beaumont, Major G. Harland Bowden, Messrs. A. A. Campbell-Swinton, S. P. Dobson, L. Gaster, T. E. Gatehouse, A. Gay, H. T. Harrison, K. Hedges, R. Rawlings, C. P. Sparks, R. A. Wallis Jones, and H. D. Wilkinson. There will be separate classes for plant, distribution of electrical energy, utilisation of electrical energy, telegraphy and telephony, and miscellaneous applications of electricity.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Accrington.**—It being considered essential that additional gas plant should be installed at the power station by October next year, the Borough Electrical Engineer has been directed to obtain tenders for the plant.

**Adelaide.**—To deal with extension of plant, a further 20,000 6 per cent. cumulative £5 preference shares are to be issued by the Adelaide Electric Supply Co.

**Bedford.**—A Local Government Board inquiry was held last week concerning a loan of £10,000 for electrical extensions. Some time ago it was proposed to instal Diesel engine plant, but this scheme has now been abandoned in favour of a steam turbine.

**Cleethorpes.**—Mr. C. S. Vesey Brown is to prepare estimates of the cost of laying mains in a large number of additional streets.

**Darlington.**—A Local Government Board inquiry was held last week concerning a loan of £21,190 for electrical extensions.

**Hoyland.**—A public electric lighting scheme is to be developed.

**Leeds.**—Sanction has been received to the borrowing of £168,000 for the electrical undertaking.

**London: L.C.C.**—Steam exhaust condenser and feed piping, water-tanks, &c., for Greenwich Power Station. December 28rd. (See advertisement on another page.)

**Shoreditch.**—The Finance Committee of the L.C.C. recommends sanction to a loan of £17,226 in connection with the linking-up scheme with the Stepney Borough Council. This is made up as follows:—Mains, £5,000; transformers, £10,000; switchgear, £1,800; and the remainder, engineer's charges and contingencies. A further loan of £75,000 has been applied for in connection with extensions at the generating station, but the Finance Committee of the L.C.C. is not yet able to deal with this.

**Morocco.**—The British Vice-Consul at Tetuan has, says the *Board of Trade Journal*, forwarded a summary of the regulations regarding electric power concessions in the Spanish zone, recently issued. This may be seen at 73 Basinghall Street, E.C.

**South Africa.**—The Johannesburg Council requires six two-phase 500-kw. rotary-converters (A.C. to D.C.) and spare parts. January, 1914. Town Clerk. Specification, &c., may be seen at Board of Trade, 73 Basinghall Street, E.C.

**Stapleford.**—The Derbyshire & Nottinghamshire Electric Power Co. has purchased land in this district for the purpose of an electric power station.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Aldershot.**—New lecture hall, new library, &c., at Staff College, Camberley. Director of Army Contracts, War Office, S.W.

**Birmingham.**—New school, corner of Nansen and Naseby Roads.

**Croydon.**—Twelve houses in Ederline Avenue. J. E. Trimble, Kilmartin Avenue.—Nine houses, Kilmartin Avenue. C. S. Banks, 16 Oakfield Road.—Sixteen houses, Bingham Road. A. C. B. Duckett, 24 Sherwood Road.—Cinematograph theatre, Lower Addiscombe Road. W. B. Sinclair, 21 Charing Cross, W.C.

**Falkirk.**—Cinematograph theatre and shops (£3,000).

**Halifax.**—Cinematograph theatre, Queen Road.

**Harrogate.**—New school. Borough Surveyor.

**London: L.C.C.**—Electric lighting of the Cherry Garden Street fire station.

New school in Wilson Street, Islington.

Stoke Newington.—Public washhouses, &c. (£1,900).

**Mansfield.**—Extensions at Mansfield Forest Hospital. (£5,000.)

**Nottingham.**—Four branch libraries.

**Sale.**—Public offices. C. T. Adshead, 4 St. Anne's Square, Manchester.

**Stafford.**—Enlargement of Technical School. (£5,000.)

**Sunderland.**—Reconstruction of warehouses at Hudson Dock North (£4,250). River Weir Commissioners.

**Workshop.**—123 lamps at the workhouse, Eastgate. December 15th. Clerk to Guardians, 66 Bridge Street.

### Miscellaneous

**Ashton-under-Lyne.**—Two automatic electric passenger lifts at workhouse. Clerk to Guardians, Stamford Street.

**Coventry.**—Ten covered-top tramcars at estimated cost of £10,000.

**Leeds.**—Sanction has been received to the borrowing of £45,000 for the tramways undertaking.

**London: L.C.C.**—Electric charging apparatus is required for the Clapham, Dulwich, Hackney, Holloway, Kensington, Lee Green, and Streatham fire stations.

**New Zealand.**—The Dunedin Tramway Manager has reported in favour of petrol-electric omnibuses.

**South Africa.**—According to the *African World*, fifteen new tramcars are required by the Johannesburg Council.

In the course of his annual report, the General Manager of the South African Railways advocates the conversion to electric traction of the Wynberg and Sea Point lines, two busy suburban lines running into Cape Town.

**York.**—Tenders are invited for four trailer cars for use on the Corporation tramways. The estimated cost of the electrical equipment of the South Bank tramway extension is £1,998.

## TENDERS RECEIVED AND ACCEPTED

**London: Hammersmith.**—The Council has received fourteen tenders for the supply of arc lamps for hiring out, and these will be reported upon at a future meeting of the Council.

**Warrington.**—The following tenders have been accepted: Boiler plant, Babcock & Wilcox, £2,362; turbo-alternator, J. Howden & Co., £5,843; condenser, Worthington Pump Co., £3,344; economiser, Goodbrand & Co., £203 10s.

The Mirrlees Watson Co. have received the following orders for condensing plant:—City & Guilds (Engineering) College; Carron Co.; De Beers Consolidated Mines, Ltd. (Kimberley); The New Jagersfontein Mining & Exploration Co.; Fife Electric Power Co.; Londonderry Collieries; Holytown Colliery; Rochdale Corporation, per Messrs. James Howden & Co.; Bournemouth & Poole Electricity Supply Co.; Oldham Corporation; Maltby Main Colliery; Harland & Wolff; Fife Coal Co.

In addition to the repeat orders already referred to in our columns for Calcutta and Dublin, and the Marylebone machines described this week, the Maschinenfabrik Oerlikon has recently received orders for the following turbo-generators:—One 3,000-kw. 3,000 r.p.m. for Aberdeen; one of the same size for York; and a 5,000-kw. machine running at the same speed for the Ebbw Vale Steel, Iron & Coal Co.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £68 to £68 10s. (Last week, the same.)

**Bankruptcy.**—J. G. Hilton, 103 Exchange Buildings, Liverpool, has been adjudicated bankrupt.

**Agency.**—A Montreal company desires to obtain the agency of United Kingdom manufacturers of electrical supplies and fittings. Further particulars, Board of Trade, 73 Basinghall Street, E.C.

**Liquidations.**—A petition for the winding up of the Electro-mobile Co. will be heard in the High Courts on December 9th, before Mr. Justice Astbury.

**FOR  
STEAM JOINTS  
USE**

**JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.**

## LOCAL NOTES

**Aberdeen: Wiring of Infirmary.**—With reference to a recent statement concerning the conditions upon which the Corporation were alleged to be willing to supply current to the infirmary, at the last meeting of the Corporation it was stated that no formal application had been received from the infirmary authorities, although the representatives had been inquiring as to the conditions upon which a supply would be given. In the circumstances, no further action is being taken in the matter.

**Chiswick: Electric Supply.**—Mr. J. F. C. Snell is advising the Council in regard to a proposal to purchase the Chiswick Electricity Supply Corporation.

**Dundee: Supply Failure at Broughty Ferry.**—In consequence of a breakdown in the Broughty Ferry supply, Mr. H. Richardson, City Electrical Engineer, has made a detailed examination of the generating plant and distribution system recently taken over from the Broughty Ferry Council, and has made a very strong report upon its condition. Mr. Richardson states that, in view of the bad state of the plant generally, cessation of the supply in Broughty Ferry, pending the completion of the arrangements he has in hand for establishing a supply station there, seems inevitable to a considerable extent. He states that the battery is absolutely useless, the pumps are inefficient, and the condenser in such a state of incrustation that it must be dealt with immediately. The back of the switchboard, says the report, is in a state of chaos, and fears are expressed that similar criticism will have to be made of the cable and distribution system generally. He does not think it possible to change the Broughty Ferry power station to a high-pressure sub-station before March, and he had hoped to struggle along with the present generating plant until then. An attempt is to be made to give the plant a general overhaul sufficient to maintain the supply.

**Friern Barnet: Demand for Electricity.**—The high price of gas in this district, viz., 8s. 4d. per 1,000 ft., led to a meeting of protest of tradesmen and ratepayers last week, and efforts are being made to secure sufficient support with a view to inducing the North Metropolitan Electric Power Supply Co. to introduce a supply of electricity.

**Haslingden: Electrical Driving in Cotton Mills.**—Mr. J. W. Crowley, of Messrs. Siemens Bros. & Co., who is specially connected with textile work, recently gave a lecture on the electrical driving of looms, ring spinning, and doubling frames at the Technical School. He stated that he did not recommend individual driving in every case, as there were many cases in which group driving offered special advantages. In the Little Harwood Shed, Blackburn, however, there were, he said, 1,140 looms, each driven by its own motor. As far as ring spinning and doubling frames were concerned, he thought there was no question of the advantages of the individual driving over group driving; but the question was an open one in respect of other classes of machinery. In answering questions at the conclusion of his lecture, Mr. Crowley said that there was a tendency on the part of textile machinery makers to treat the electrical engineer with scant courtesy when he made suggestions with regard to the driving of machinery electrically, although efforts were now being made to bring the two sides into better harmony. The electrical loom formed an interesting question, but he was afraid we were a long way off from making any big development in that direction.

**Leeds: Employees Wages.**—The Electricity Committee, in common with practically all the committees of the Corporation, is met with demands from the Employees' Union for increased wages, but a scheme which has been prepared is said not to meet with the approval of the men's leaders.

**Manchester: Electricity Works Record.**—The output of electricity from the Corporation's power station last week exceeded all previous records. The number of units delivered to the mains was 574,000, and at one time the demand on the plant was 49,000 kw.

**Minehead: Outside Lighting Scheme.**—The Minehead Electric Supply Co. has introduced a differential tariff system of charging for outside lighting purposes. The scheme applies to outside lighting of business premises only, and the total candle power installed must not be less than 200. The current required for the lamps will be taken from a special meter and charged at 2d. per unit, in addition to a fixed charge per annum of 21s. for 200 c.p.; 25s. for 250 c.p.; 35s. for 500 c.p.; 40s. for 600 c.p.; and 60s. for 1,000 c.p.

**Northampton: Municipal Electric Supply.**—The Corporation has passed a resolution instructing the Town Clerk to report

on the legal position as regards the purchase of the Northampton Electric Light and Power Co.

**Street Lighting.**—The Council has ordered an inquiry to be made into the question of public lighting with the view of possibly acquiring these portions of the undertakings of the local electric lighting and gas companies.

**Redditch: Electricity Undertaking.**—Mr. R. N. Mayne, the recently appointed Borough Electrical Engineer and Manager, in a report upon the electrical undertaking states that in his opinion the prospects are sufficiently good to warrant the Council involving a capital expenditure of some £8,000 upon additional plant. As we have already noted in these columns, there is considerable opposition on the part of some of the members of the Council to this course being followed, the prevailing idea being that an increase in charges should be made. Mr. Mayne, however, is most emphatic that this would incur the immediate loss of many of their largest consumers.

**Widnes: Transporter Bridge.**—The electrically-driven transporter bridge between Widnes and Runcorn has been reopened after a rearrangement of its electrical equipment. Originally the transporter carriage was propelled by means of two electrically driven motors driving on a rack rail, but for this there has been substituted an electrically-driven haulage system similar to that in use on the other transporter bridges at Middlesbrough and Newport (Mon.). Simultaneously the gas-driven generating plant has been displaced in favour of power from the mains of the Mersey Electric Power Co.

## APPOINTMENTS AND PERSONAL NOTES

An interesting presentation of a gold watch and chain has been made to Mr. N. W. Prangnell, of the Metropolitan Electric Supply Co., by the Electric Supply Publicity Committee, as a token of their appreciation of his management on their behalf of La Maison Electrique, at the Ideal Home Exhibition, Olympia.

The increase in the salary of Mr. C. Furness, Borough Electrical Engineer at Blackpool, referred to in our last issue, has been sanctioned by the Council.

A Charge Engineer is required by a large power company in the south of Europe. (See advertisement on another page.)

Colliery electrician required for coal-cutter repairs. (See an advertisement on another page.)

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &amp;c.

**Chloride Electrical Power Storage Co.**—An interim dividend of 5 per cent. free of tax has been declared on the ordinary shares.

**Portarlington Electric Light & Power Co.**—A prospectus has been issued offering 2,600 cumulative shares of £1 each at par.

**British Westinghouse Co.**—In the Chancery Division Mr. Justice Astbury has sanctioned a reduction in capital of from £1,875,000 to £1,150,000. The reasons for the reduction given on behalf of the Company were losses in respect of patents and goodwill and the arbitration between the Company and the Underground Electric Railways of London.

**Consolidated Diesel Engine Manufacturers.**—A Shareholders' Committee of Investigation has been appointed to inquire into the present position of affairs of this Company.

**The Institution of Electrical Engineers.**—As the discussion on Dr. Klingenberg's address on "Electricity Supply of Large Cities" will be concluded on December 4th, there will not be a meeting of the Institution on December 11th.

**Electricity Supply in London.**—Last session the County of London Electric Supply Co. obtained in its Romford Electric Lighting order an option to acquire a site of 23 acres close to Barking, and the question of the possible significance of this was raised at the L.C.C. meeting on Tuesday. The Chairman of the Highways Committee stated that the L.C.C. was aware of the provisions of this Electric Lighting Order, and had taken the only steps open to it, viz., to secure the insertion in it of a provision that, before any connection could be made between any station built on this site and the London supply system, the Board of Trade's consent must be obtained, the L.C.C. at the same time having the right to be heard on the matter.

### SUMMARY

THE Committee on electrical vehicles appointed by the I.M.E.A. is being extended by the co-option of members representing all interests in the matter. (Page 694.)

THE annual dinner of the I.E.E. Students' Section was held on Monday last. (Page 694.)

DR. KLINGENBERG's address to the Institution of Electrical Engineers on "Electricity Supply in Large Cities," outlined a scheme for the supersession of 22 of the existing 64 generating stations by a few very large ones, and the gradual conversion of the remainder into sub-stations. By comparing the conditions in different cities, however, the result was arrived at that, without a more diversified load, the advantage from centralisation in the London area would be limited. This scheme did not show sufficient advantage to the public to meet with Dr. Ferranti's approval. (Page 695.)

WE give particulars of the new London Electrical Masters' Association, and also discuss the circumstances of the wiremen's strike at the Pearl Assurance Co.'s building in Holborn. (Page 696.)

By the New Year there will be 28 railways in America using 1,200 or 2,400 volts direct current on the trolley line. It is expected that this and the split phase system will be largely used in the future, although the overall efficiency of the latter is very low. (Page 698.)

THE Marconi wireless station now being erected near Carnarvon has an aerial of 82 wires of silicon bronze,

supported on masts 400 ft. high. Provision is made for 1,000 h.p. in motor generators for power purposes. —Tuning, and the behaviour of different kinds of waves for the transmission of wireless messages are considered. (Page 698.)

A PATENT relating to automatic telegraph transmitters by J. A. L. Dearlove and S. G. Brown, and one relating to C. B. telephony by the W. E. Co., are expiring after a life of fourteen years. The specifications published by the Patent Office last week include one by the B.T.-H. Co. for making a vacuum-tight seal for quartz tubes, and one also by the B.T.-H. Co., relating to the use of gas at very low pressure in the bulbs of ordinary incandescent lamps. The Marconi Co. and C. S. Franklin are protecting a closed circuit directive aerial. (Page 699.)

A CASE of damage done to incandescent lamps by the effect of a lightning discharge is discussed in our Questions and Answers columns. (Page 700.)

OUR "ELECTRICAL ENGINEERING Literary Section" contains a list of new publications, reviews of a number of technical books, and gives a selected list of recommended works on all branches of electrical engineering. (Page 701.)

A SHIP-CLEANING equipment, in which an electrically driven rotary fibre brush is used, is described. The brush is suspended from a jib on a barge, and works under water. (Page 705.)

AN article emphasises the necessity for using lamps of the proper voltage ratings. (Page 702.)

AN electrically heated comb, and a new form of laminated gearing, are described, and notes on a wiring system and the use of casing appear on page 708.

ELECTRICAL plant and mains are required at Huddersfield, Keighley, Loughborough, Battersea, Hindley, Chesterfield, Carlisle, Warrington, West Ham, and Burnley.—The Manchester Corporation requires a number of large converting sets.—Telephone material is required in Australia. (Page 709.)

MESSRS. SIEMENS BROS. DYNAMO WORKS gave a demonstration yesterday afternoon of a range of half-watt lamps which are shortly to be placed on the market. (Page 709.)

THERE is a possibility of the Hove Corporation leasing its electricity undertaking.—Mr. Richardson's report on the conditions of the Broughty Ferry electricity undertaking was discussed last week.—The Chairman of the Southampton Electricity Committee and the Borough Electrical Engineer are in conflict as to the desirability of increasing the charge for electrical energy.—The Newcastle-on-Tyne Electric Supply Co. is erecting a new power station in which coke-oven gas will be utilised. (Page 710.)

THE India Rubber, Gutta Percha, and Telegraph Works Co. declare a dividend of  $7\frac{1}{2}$  per cent. on the ordinary shares. (Page 710.)

## ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, DECEMBER 11TH.

*Institution of Electrical Engineers: Scottish Section.*

7 p.m. Annual Dinner at The Grosvenor, Gordon Street, Glasgow.

FRIDAY, DECEMBER 12TH.

*Institution of Electrical Engineers: Newcastle Section.*7 p.m. At Hugh Bell School, Middlesbrough. "Electricity Supply in Large Cities," by Dr. Klingenberg.  
*Electro-Harmonic Society.*

8 p.m. Smoking Concert at Holborn Restaurant.

SATURDAY, DECEMBER 13TH.

*Mining Institute of Scotland.*

3 p.m. At 39 Elmbank Crescent, Glasgow. Discussion on Mr. W. Dunn's Paper, "The Electric Winding Plant at South Kenmuir Colliery."

*Birmingham and District Electric Club.*

7 p.m. Annual meeting at Swan Hotel, New Street.

MONDAY, DECEMBER 15TH.

*Institution of Electrical Engineers: Newcastle Students' Section.*

7.30 p.m. At Armstrong College. "The Application of Lightning Arresters to A.C. Systems," by R. C. Philipp.

TUESDAY, DECEMBER 16TH.

*Physical Society.*

3-6 and 7-10 p.m. Exhibition at Imperial College of Science.

*Institution of Electrical Engineers: Newcastle Section.*

7 p.m. Annual dinner at County Hotel.

*Institution of Electrical Engineers: Manchester Section.*

7.30 p.m. At University. "Employment of Power in H.M. Post Office," by H. C. Gunton.

WEDNESDAY, DECEMBER 17TH.

*Institution of Electrical Engineers: Students' Section.*

7.45 p.m. At Victoria Embankment. Discussion on "Underground and Surface Transport of Passengers and Goods in London."

*Royal Society of Arts.*

8 p.m. "The Channel Tunnel," by A. Fell, M.P.

THURSDAY, DECEMBER 18TH.

8 p.m. "The Employment of Power in H.M. Post Office," by H. C. Gunton.

FRIDAY, DECEMBER 19TH.

*Institution of Electrical Engineers: Birmingham Section.*

Annual dinner.

*Institution of Civil Engineers: Students' Section.*

8 p.m. "Air Filtration and the Cooling and Ventilation of Electrical Machinery," by W. E. Gurry.

## The London Electrical Engineers.

(TO-DAY) THURSDAY, DECEMBER 11TH.—C. Company. Technical Instruction, 7 to 10 p.m.

FRIDAY, DECEMBER 12TH.—D. Company. Special Class on Crossley Engine, 7 p.m. Technical Instruction, 7.30 to 9.30 p.m.

SATURDAY, DECEMBER 13TH.—Headquarters open from 10 a.m. till noon.

MONDAY, DECEMBER 15TH.—A. Company. Technical Instruction, 7 to 10 p.m.

TUESDAY, DECEMBER 16TH.—B. Company. Technical Instruction, 7 to 10 p.m.

WEDNESDAY, DECEMBER 17TH.—Recruits only. Infantry Drill and Technical Instruction, 7 to 10 p.m.

THURSDAY, DECEMBER 18TH.—C. Company. Technical Instruction, 7 to 10 p.m.

FRIDAY, DECEMBER 19TH.—D. Company. Special Class on Crossley Engine, 7 p.m. Technical Instruction, 7.30 to 9.30 p.m.

SATURDAY, DECEMBER 20TH.—Headquarters open from 10 a.m. till noon.

**The New Street Lamps in Marylebone.**—A correction is necessary to the short note published on p. 683 of our last issue. The street lighting columns in question were supplied by the Borough Surveyor, and the fittings were decided upon by the Electricity Department of the Borough Council, and purchased from the Electric Street Lighting Apparatus Co.

**Electrical Driving of Forging and Stamping Plant.**—In a Paper read before the Rugby Engineering Society on recent improvements in power-driven forging and stamping plant on November 25th, Mr. W. Spencer gave some interesting notes on electric driving. Rows of stamps are most conveniently driven by a main shaft driven by gearing from a quick-running back shaft provided with a flywheel serving as a pulley belt, driven by a motor fixed to the stanchions. With several stamps in a battery, the power required will be less than the sum of the powers for the separate stamps by a factor varying from 0.84 for two stamps to 0.47 for five stamps. The average horse-power taken by single drop stamps varies from 2 b.h.p. for a 3 cwt. stamp to 25 b.h.p. for a 100 cwt. stamp. Compound-wound motors are recommended, wound so as to speed up by about 20 per cent. between the loaded periods; should shunt motors be used they should be 15 per cent. larger. Alternating-current motors can be used either of the slip-ring or squirrel-cage patterns. Motors should be protected against dust. Regarding compressed-air hammers, the author considers that their disadvantages when driven from a general supply of compressed air disappear when they are of the electrically-driven type, each with its own air-pump forming part of the apparatus. These may be driven through a paper pinion or a short belt and jockey pulley. The power taken varies from 3 b.h.p. for a  $\frac{1}{2}$  cwt. hammer to 35 b.h.p. for a 20 cwt. hammer.

## THE ELECTRIC VEHICLE COMMITTEE

THE second meeting of the Electric Vehicle Committee, appointed by the I.M.E.A., was held on November 14th. The members of the original Committee are as follows:—R. A. Chattock (City Electrical Engineer, Birmingham), Chairman; F. Ayton (Engineer and Manager, Corporation Electric Supply and Tramways Departments, Ipswich), Hon. Sec.; A. C. Cramb (Borough Electrical Engineer, Croydon); J. Christie (Borough Electrical Engineer, Brighton); J. E. Edgecome (Borough Electrical Engineer, Kingston-on-Thames); H. Faraday Proctor (City Electrical Engineer, Bristol); A. H. Seabrook (General Manager, St. Marylebone Council Electric Supply Department). The following are co-opted members:—F. E. Gripper (Edmundsons Electricity Corporation), representing the Provincial Electric Supply Companies; E. S. Jacob (Tudor Accumulator Co.) and W. S. Naylor (Chloride Electrical Storage Co.), representing the accumulator section of the B.E.A.M.A.; J. F. Monnot, representing Arrol-Johnston, Ltd.; R. E. Mossay (Lloyd Electric Cars), representing makers of electric vehicles; and W. H. L. Watson (Edison Accumulators, Ltd.).

An invitation to nominate a representative has been sent to the Association of Electric Power Companies, and a similar invitation has been sent to the Electrical Contractors' Association, which has appointed Mr. W. R. Rawlings for this purpose. The B.E.A.M.A. has also been asked to appoint representatives of the manufacturers of electric motors and switchgear. The London Electric Supply Companies, the Royal Automobile Club, and the Automobile Association & Motor Union have declined to be represented. Mr. Conway Jenkins has been elected to represent the F.R.A.M. Co.

The present Committee will hold office until December 31st, 1914. A technical and a commercial sub-committee have been appointed. The first is considering the adoption of a standard plug on the lines of the revised standard plug in use in America by the Electric Vehicle Association with which the Committee is affiliated. Rates for the insurance of electric vehicles and tariffs for charging are among the subjects which the commercial sub-committee has in hand, and it is hoped to arrange a conference with the representatives of the London Electric Supply Companies. The commercial sub-committee is also taking in hand the matter of publicity work.

## THE I.E.E. STUDENTS' SECTION DINNER

THE tenth annual dinner of the Students' Section of the Institution of Electrical Engineers was held on Monday evening last at the Trocadero Restaurant. The evening passed off in a most enjoyable way for all those concerned, but it is to be regretted that the attendance at these functions shows no sign of being on the increase. The usual toasts were proposed and responded to, and proved more enjoyable than the musical part of the programme, which was somewhat longer than necessary. It appears, especially from the speech made by the Chairman, Mr. S. M. Hills, that the examinations for associate membership of the Institution are still regarded with awe by many of the student members. He suggested that Papers read before the Students' Section might be taken into account by the Council when considering an application for transfer. Dr. S. P. Thompson, in one of his characteristically attractive speeches which endear him to all, whether they have had the good fortune to study under him or not, replied that such Papers are taken into account, although this is not expressly stated. The examination itself is only designed to find out whether the candidate "knows his job," and is not in the least academical. Alternatively a "thesis" may be submitted. This may be entirely new, and may deal with any electrical subject; it may be the result of researches already published, or a Paper read before an engineering society and re-written with preferably the criticism raised in the ensuing discussion embodied. Thus the choice of subject allowed is as wide as possible. The right of oral examination of the candidate on the subject of the thesis is reserved so that it may be tested whether he really wrote it himself. Mr. W. Duddell, Mr. A. H. Seabrook, and Mr. W. M. Mordey also added to the knowledge and enjoyment of the other diners. The Hon. Secs., Messrs. E. T. Driver and R. A. MacMahon, the Chairman, Mr. S. M. Hills, Messrs. R. E. Dickinson, and E. L. M. Emtage and the Committee of the Students' Section may be congratulated for engineering such a pleasant evening.

## ELECTRICITY SUPPLY FOR LONDON

DR. G. KLINGENBERG delivered a valuable Address, bearing the title, "Electricity Supply in Large Cities," to a large gathering of engineers interested in electricity supply at the meeting of the Institution of Electrical Engineers on Thursday last. The Address was also discussed at Newcastle on Monday, at Edinburgh on Tuesday, and it is down for discussion at Middlesbrough on Friday.

There were only four speakers at the meeting in London, and, contrary to expectation, but little of interest was said, though there was ample scope offered. Dr. Klingenberg began by comparing the state of electricity supply in Berlin, Chicago, and London, and he concluded that if all the sixty-four generating stations were shut down and a few large new generating stations substituted, a saving of about 40 per cent. on all working costs with an increase of the total capital now invested of less than 20 per cent. would result. He would provide greater London with three duplicated sets of inter-connected ring mains and use the existing generating stations as sub-stations. A supply at 50 cycles per sec. three-phase would ultimately become universal. At first a large generating station of 83,000 kw. capacity would be built on a coalfield, or on the outskirts of the city, i.e., about ten miles from the centre, on the river. In the latter case, 20,000-volt single core cables would be used to feed the sub-stations, and in the former case the main transmission would be at 100,000 volts three-phase by pole line, or cable, with a transforming station to step the pressure down to 20,000 volts on the outskirts. This supply would feed twenty-two of the twenty-five 50-cycle stations now in existence while the remaining three, having capacities over 18,000 kw. each, would be retained. These would be required to assist during the peak load periods for about eight months of the year. Gradually the whole distribution system would be changed to three-phase 50 cycles, and the other generating stations changed into sub-stations, and finally the three remaining alternating-current generating stations would themselves be shut down as the extensions progressed. If the new large generating station were situated about ten miles from the centre of the city Dr. Klingenberg estimated that the conversion of the existing 50-cycle and direct-current distribution networks on the lines indicated could be carried out at a cost of about £15 10s. per kw. installed. Allowing a 10 per cent. capital charge on the new generating station, 8 per cent. on the twenty-five old 50-cycle generating stations, and 8 per cent. on the distributing system, the total costs per kw.-hour sold would be reduced from about 2.345d. to 1.97d. At the same time the capital would be increased from £9,191,500 to £10,905,000, i.e., by £1,713,500.

During the discussion, Dr. S. Z. de Ferranti explained that, owing to the position of affairs in London at the present time, many engineers capable of discussing critically Dr. Klingenberg's proposition were unable to do so, but it was his opinion that no change of the magnitude suggested would be brought about unless some great advantage to the public was shown. The new scheme would have to be so comprehensive that the cost of electricity to the consumer would be brought down to a low figure, sufficiently low to make the use of electricity universal, and then the capital cost would be so great that the large commitments of the past would sink into insignificance. In conjunction with Mr. J. F. C. Snell, Dr. Ferranti pointed out the necessity of any new large generating station being built where a constant plentiful supply of cooling water could be obtained. No station employing any thermal process of energy conversion could be erected on the coalfields without this condition being fulfilled. Mr. Snell's opinion is that it would pay to continue and to extend eight of the sixty-four existing generating stations in London, to extend about ten other stations to a limited degree, and to supersede the remainder. He thinks that there is now no chance of London getting the traction load for many years to come, and without it the conditions of supply cannot be greatly improved, as Dr. Klingenberg showed in his Address, unless this very important demand, which should have been acquired about eight or nine years ago, is supplied from the same system as the other classes of load. There should be built a new bulk generating station on the Thames from ten to fifteen miles from the centre of the city, and the whole supply should be under one authority, with the existing concerns retained as distributors. Mr. W. C. P. Tapper, Electrical Engineer and General Manager of the Stepney Borough Council, who also spoke in the discussion, appeared to regard it as disadvantageous as regards business to do away with direct-current networks for the power load, especially on account of the effect of the power factor on the size of mains and generators. Perhaps, however, it would not be

too unreasonable to hope that, by the time Dr. Klingenberg's proposals, or something on the same lines, become a *fait accompli*, the various methods of improving power factors will have been sufficiently perfected.

Some of the other points dealt with in Dr. Klingenberg's Address may be summarised as follows: In Berlin and Chicago there are six generating stations of an average size of 23,000 kw. and 37,000 kw. capacity respectively, while in London the average size of the sixty-four generating stations is only 4,670 kw. To meet present-day requirements in large cities feeder cable pressures should not, he said, be lower than between 20,000-30,000 volts, so that as much as 10,000 kw. can be transmitted through one cable when the cost of the cable per kilometre per kw. transmitted is reduced to about 2s. 6d. The cost of this part of an installation would then become of less relative importance than hitherto. Dr. Klingenberg made use of the expression "utilisation" or "utility factor," a term apparently regularly employed on the Continent, to indicate what is known here as the plant load factor, namely the ratio of the average load sold to the plant capacity. The power consumption per head of population is about 310 kw.-hours per ann. in Chicago, 170 in Berlin and 110 in London. While the total capital costs per kw. of the same cities are about £60, £47 10s., and £73 respectively. The "utility factors" are about 33 per cent., 18 per cent., and 12.2 per cent. in these towns. In Chicago the traction load predominates (approx. 70 per cent.), in London the lighting load predominates (approx. 60 per cent.), and in Berlin the power, lighting, and traction loads are in a more even ratio. A study of all the conditions prevailing led the lecturer to the conclusion that by centralisation alone the load factor in London could not be appreciably improved; what was necessary was to alter the nature of the consumption. It was also shown that for values of the utility factor between 10 and 30 per cent., the selling price could be reduced by more than 8 per cent. for each advance of 1 per cent. made in utilisation without extensions or alterations to existing plant.

Dr. Klingenberg said that the reason why he suggests cable transmission at 100,000 volts three-phase are that, as the neutrals of the system would be earthed, the pressure between earth and conductors would be only 60,000 volts, and single-core, lead-covered cables laid direct in the ground with mechanical protection would be employed. "It should be borne in mind," he said, "that with such high pressures and the attendant high strain on the insulation, the idea of employing cables cannot be entertained unless the energy to be transmitted is very considerable and the sections of the cable become large in consequence. The recent development towards large power stations and long-distance transmission has therefore advanced conditions in favour of high-tension cables, so that for installations of this kind under certain circumstances as are encountered in large cities, cables appear to be equally satisfactory or even superior to overhead transmission lines." It appears that, with a coal freight at 3s. 6d. per ton, and with a normal utility factor, it would be cheaper to build a new bulk-supply generating station near the city than at the coal mines.

**Edison Battery Cars.**—Certificates have been issued by the Royal Automobile Club in respect of two tests of an Arrol-Johnston-Edison electric coupé entered by Edison Accumulators, Ltd. (283 Duke Street, Piccadilly, W.). The first trial was abandoned, due to mechanical trouble with the back axle, but the result of the second trial on Nov. 11th is given in the certificate as follows:—"The trial, which was to show the distance travelled on one charge, was held on Brooklands Track. The weight of the car was 3,064 lb. (27½ cwt. approx.)—i.e., front axle, 1,487 lb.; back axle, 1,577 lb. The running weight, with passengers, was 3,429 lb. (30½ cwt. approx.). The car ran without stopping 54.85 miles at an average and even speed of 15.99 miles per hour. It then stopped on the slope of the track (behind the Members' Hill)."

**The Physical Society's Annual Exhibition.**—This exhibition, which is to be held on Tuesday next, Dec. 16th, at the Imperial College of Science, South Kensington, will be open in both the afternoon (from 3 to 6 p.m.) and in the evening (from 7 to 10 p.m.). Prof. the Hon. R. J. Strutt, F.R.S., will give a discourse at 4.30 on "Spiral Electric Discharges," and Mr. Louis Brennan will show some experiments with soap films at 8.30 p.m. Some thirty firms will be exhibiting, and there will also be certain experimental demonstrations. Invitations have been given to the Institution of Electrical Engineers, the Institution of Mechanical Engineers, the Faraday Society, the Optical Society, and the Röntgen Society. Admission will be by ticket only, and members of the societies just mentioned and of the Physical Society desiring to attend the Exhibition should apply to the Secretary of the Society to which they belong.

## THREATENED STRIKE OF ELECTRICAL WORKERS

### New Electrical Masters' Association : Strike at Pearl Assurance Building

SOME important developments affecting the wages and conditions of wiremen in London are taking place in connection with a demand by the Electrical Trades Union for an increase of the standard rate of wage from 9½d. to 11d. per hour, for an accepted code of working rules, and for corresponding increases to other grades of electrical workers. The matter was first brought into prominence last month, when a letter dated November 11th was sent by the London Secretary of the Electrical Trades Union to some 600 electrical contractors and building firms in the Greater London area, pointing out that the conditions of living in London during recent years involve considerable extra expense, and quoting the Board of Trade figures of a general increase in living expenses of 15 per cent.

The difficulty was at once apparent that there was no masters' association in London which could negotiate with the Electrical Trades Union, for the Electrical Contractors' Association is unable by its Articles of Association to deal with matters relating to wages. It was thereupon decided to call a meeting of the electrical contractors, electric supply companies, and municipal bodies employing electrical wiremen, in order to discuss the question. This meeting took place at the Institution of Electrical Engineers on Wednesday last week, and the outcome was the formation of the London 'Electrical Masters' Association, the membership of which will consist of "Persons, firms, companies or corporations employing men engaged in any class of electrical work, and whose registered address is within the area of Greater London." The objects of the Association are, *inter alia*, to enter into agreements with trades unions or other organised bodies of employees, and to act as a body of reference to adjust any complaints or differences. The organisation will consist of a standing committee, and the first members of this are:—J. H. Bowden (Borough Electrical Engineer, Poplar), Chairman; L. H. Hordern (Westminster Electric Supply Corporation); F. J. Walker (St. James & Pall Mall Electric Light Co.); D. Mackness (Trollope & Colls); H. Marryat (Marryat & Place); A. R. Phipps (Rashleigh Phipps & Co.); W. R. Rawlings (Rawlings Bros.); L. L. Robinson (Borough Electrical Engineer, Hackney); H. B. Read (Edmundson's Electricity Corporation); H. F. Simon (Electrical Installations, Ltd.); F. H. Starling (Blackburn, Starling & Co.); D. H. Strode (Strode & Co.); G. E. Taylor (G. E. Taylor & Co.); Duncan Watson (Duncan Watson & Co.); L. G. Tate (Secretary).

This Standing Committee met on Monday, and appointed the following Sub-Committee:—Duncan Watson, F. J. Walker, E. Radford, H. F. Simon, and F. H. Starling, with the Chairman and Secretary *ex-officio* members.

Consideration has been given to the letter of November 11th, already referred to, and a reply has been sent, stating that the Committee will be prepared to meet representatives of the Union at a conference to be held during the month of January if the following conditions are agreed to:—

- (a) That there shall be no stopping of work or interference with non-Union men now or while the matter is under discussion.
- (b) That where any interference has already taken place, the same shall be immediately stopped and work resumed.
- (c) That the rule adopted by most trades as to interference with other trades be included in any agreement come to, namely:—

No exception shall be taken to the employment or non-employment of a man on the ground that he is or is not a member of the Trades Union, neither shall any exception be taken to the employment of a man in any other trade on the ground that he is or is not a member of a Trades Society.

#### STRIKE AT PEARL ASSURANCE CO.'S BUILDING.

In the first week of its existence the new Association is faced with the task of solving some important questions which have arisen in connection with the strike of electrical wiremen at the Pearl Assurance Co.'s new building in Holborn. Messrs. Duncan Watson & Co. are carrying out the electrical installation there, and were employing upon it sixteen men, half of whom were members of the Electrical Trades Union. On Tuesday morning of last week, however, without any warning, the firm was notified that unless all the men joined the Union the others would be withdrawn at midday. Mr. Duncan Watson flatly refused, and the Union kept its word, at the same time inducing some 165 men in other trades to follow suit. The non-Union men, who are the permanent employees of Duncan Watson & Co., however, are still at work, and so far as the other trades are concerned, the respective Unions, we understand, disclaim all responsibility. Some time ago, on the same building, a dispute arose between the Electrical Trades Union and Messrs. Duncan Watson & Co. over the employment of pipe-fitters for the piping and conduit work, under the control of a competent foreman, it being convenient to do this before any of the wires were

drawn in. The Union claimed that electrical wiremen should be employed on this work, but the firm resisted, and the matter died out. It may not be without significance that the present strike is the eighth which has taken place amongst the various workmen employed on the Pearl building.

These are the facts of the latest strike on this building, but it is not the first time that Messrs. Duncan Watson & Co. has had disputes with the Union. In an interview with Mr. Duncan Watson, our representative was informed that two years ago, on a contract for the Home Office at Wormwood Scrubs, seven charges were made against Mr. Watson's firm of not paying the recognised rate of pay. A Home Office investigation found six of these not proved, whilst as to the seventh, independent arbitration decided that, in the absence of any recognised rate of pay for men fixing transformers—which was the work in question—the man complained of should, they thought, have been paid an extra ½d. per hour for 3½ hours out of three days' work on the job! At that time we are assured that the firm paid 10d., 9½d., and 9d. per hour to its men, according to qualifications, and that at present the rates paid are 10½d., 10d., 9½d., and 9d. per hour.

Mr. Watson stated that he has considerable evidence that following the Wormwood Scrubs incident, the Union, or someone connected with it, for a long time sent communications to a number of his clients making allegations against the firm. This practice, however, was abandoned later. Mr. Duncan Watson is emphatic that he never has, and does not now, make it a condition of employment that a man should not belong to the Union, but he is equally emphatic that he shall be free to employ non-Union men when he pleases. In this he has the whole-hearted support of the new Masters' Association, as will be seen from the letter set out above. Facilities have even been given to the men to hold meetings on the firm's premises—in the absence of the principals—to discuss the whole position, and the Secretary of the Trade Union has been present. Later, one or two of the Union men admitted they knew nothing of the rules of the Union, which, by the way, we understand are regarded as unsatisfactory by the officials, and are under revision.

Mr. Watson agrees that there are matters which require adjustment as between the masters and men in the electrical trade, but regards, in the first place, absolutely necessary that grading of workmen must be recognised in the absence of any apprenticeship system. In all the allied trades the men are paid according to qualifications, and he suggests that a recognised system of grading could be drawn up by a joint committee of employers and employees, with an independent chairman. Under such a system no employer could pay a man less than the recognised rate for his grade, especially if some system of apprenticeship and registration could be evolved, which he does not think impossible. Another matter which he thinks should be provided against is the making of statements which might be of a libellous character by the Unions to clients of contractors, these being made in the full knowledge that the Unions are "without the law."

It is felt that the present action of the Union was an attempt to get practically all wiremen into the Union before the proposed meeting of employers took place. It is significant, however, as we pointed out in connection with the recent Home Office strike (see ELECTRICAL ENGINEERING of August 28th, p. 486, and September 11th, p. 512), that very few of the leading London contractors employ any large number of Union men, and as the relationship between the non-Union employees and their employers has in most cases been of the most harmonious character, there is a determination on the part of the masters to resist any such interference. The whole position at the Pearl building is now under consideration by the Masters' Association, and it is no longer a matter between the Union and Messrs. Duncan Watson & Co.

**Institution of Electrical Engineers.**—The following is the result of the ballot for new members at the meeting on Thursday:—*Member:* W. P. Allen. *Associate Members:* Capt. D. S. Collins, R.E., Capt. B. C. Gardiner, R.M.L.I., Lieut. H. de C. Toogood, R.E. *Graduates:* H. D. Carter, R. E. Hume-Williams, W. G. P. Wall. *Students:* T. C. Angus, F. L. Ballard, S. N. de Moura, M. Dewhurst, R. Fruhe-Sutcliffe, C. F. Lane, J. M. Parikh, C. W. Parry, A. B. Reynolds, W. Young. *Candidates transferred. Student to Associate Member:* B. B. Pradhan. *Student to Associate:* H. A. Carney. *Student to Graduate:* H. Price.

**Electric Smoke Abatement.**—The *Electric City Magazine* of Chicago describes a novel application of the electric discharge in smoke prevention. The principle of the method is to charge the soot particles from a corona discharge as the smoke passes through a settling chamber in the stack. They then cling together and fall by their own weight instead of being carried out into the atmosphere. It is stated that an expenditure of 300 watts will clean effectively a flow of from 800 to 1,000 cubic feet per minute of the densest black smoke. The wires are arranged on insulators, so that the smoke passes through about four feet of carbon discharge. The draught is not interfered with, and the ozone produced tends to purify the gases.

# FOR XMAS TRADE

## "GEEKO"

### ELECTRICAL NOVELTIES

**New List** (No. 01734) **Just Published**

POST FREE ON REQUEST.

Containing Prices and Particulars of an extensive range of "Geeko" Electrical Novelties suitable for Xmas Presents, etc. Profusely illustrated with latest designs in Pocket Lamps, Torches, Hand Lamps, Cycle Lamps, Lanterns, Floral Table Decorations, Electric Models, Electric Clocks, Cigar Lighters, Electric Candles, Massage Vibrators, Hair Dryers, Advertising Novelties, etc., etc.

"Geeko" Electrical Novelties are becoming more and more popular, especially at this season of the year. Retailers should therefore get busy—a display of "Geeko" Novelties in your window or on your counter will assist your sales.

Queen Anne's Chambers, Chartered Patent Agent  
30, Broadway, Westminster, London, S.W.

## REMOVAL.

Mr. J. G. LORRAIN, M.I.E.E.,  
M.I.Mech.E., Chartered Patent  
Agent, has removed his office from Norfolk House, Norfolk  
Street, Strand, W.C., to  
Staple Inn Buildings, High Holborn, London, W.C.

## ELECTRIC TRACTION NOTES

The last issue of the *General Electric Review* (New York) is devoted to a consideration of electric traction. Mr. W. B. Potter (Chief Engineer, Railway and Traction Department, American G.E. Co.) says that the mercury arc rectifier in small sizes has proved so successful that with further development it is probable the capacity of the rectifier will be increased and made suitable to meet railway requirements. The principal field of usefulness will doubtless be in sub-stations, where, under favouring conditions, it would replace the rotary-converter or motor-generator set. There is also the possibility of rectifiers being used in connection with D.C. motor equipments on locomotives supplied with single-phase current. For steam railway electrification, with present knowledge of the several systems and their possibilities, the choice seems to lie between the high voltage D.C. system and the split-phase system, each of which will have its particular field of usefulness, with the probability that in the majority of instances the economic advantage will be in favour of direct current. Mr. J. A. Dewhurst points out that by the beginning of next year there will be twenty-eight railways using high pressure, 1,200 or 2,400 volts, direct-current, in the United States. The total route mileage will be 1,946 miles. Seventeen of these routes are completely new, six were formerly, wholly or in part, worked by steam, three were worked single phase, and three at 600 volts D.C. Mr. C. E. Eveleth, working out the average all-day efficiencies under main-line conditions for twelve different systems, comes to the following results:—The maximum efficiency of 59 per cent. is shown by three-phase 25-cycle transmission at 100,000 volts with three-phase geared motors, and by a similar system using single-phase current. The next best system, with an efficiency of 58 per cent., is one using three-phase 25-cycle transmission and D.C. motors. Single-phase 25-cycle transmission with single-phase geared motors come next, with 57 per cent. efficiency. The split-phase systems are at the bottom of the list. With single-phase transmission at 25 cycles and split-phase geared motors the efficiency is 49 per cent., making the system eighth. The ninth system, with an efficiency of 47 per cent., uses three-phase transmission at 60 cycles and single-phase geared motors. Two systems having 46 per cent. efficiency come next. These use three-phase 60-cycle transmission with three-phase geared motors and single-phase 25-cycle transmission, split-phase geared motors driving through side rods. The lowest of the systems considered shows 43 per cent. efficiency only. In this, 60 cycles three-phase transmission and split-phase geared motors are used. High-pressure D.C. railways are not considered.

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

In the *Wireless World* reference is made to the Transatlantic station of the Marconi Company, which is being built near Carnarvon, to work direct with New York. The transmitting aerial consists of 32 wires of silicon bronze, supported by ten tubular steel masts each 400 ft. high, on heavy concrete foundations. The earth system consists of two wide circles of plates sunk in the ground. Extensions to this system are buried underground immediately beneath the aerial, and extending as far as the eastern extremity of the site. The main building contains the permanent transmitting section and an experimental section. The permanent section consists of a large machinery hall for two main motor-generator sets of 500 h.p., taking power from the North Wales Power Co.'s water-power station near Llanberis, and the main switchboards. The motor-generator sets used in conjunction with the transmitting plant are situated in an annexe. Adjacent to this hall are the two silence chambers containing the two transmitting discs, and behind these are the transformer room and offices, &c. The experimental section adjoins the main machinery hall on the west side, and will contain various machines to be used for special work in connection with Mr. Marconi's latest device for generating continuous waves. Power is delivered on the site through a small sub-station, where it is transformed down from 30,000 volts to 440 volts, for the main motors in the machinery hall. The plant at this station will be controlled and operated from the receiving station at Towyn, Merioneth, and land wires are now being installed to connect these two stations.

Mr. J. St. Vincent Pletts, A.C.G.I. (Chief of the Patents Department, Marconi's Wireless Telegraph Co., Ltd.), dealt with tuning and the production and behaviour of different kinds of wave trains at his fifth lecture on Wireless Telegraphy at the City & Guilds (Engineering) College, on Thursday last. To obtain very great selectivity double tuning is sometimes used, i.e., the telephone circuit is also tuned to the group frequency. In this case it is necessary for a very pure note to be used. This is generally obtained by the use of the rotating disc discharger which runs synchronously with the primary alternator, generally by being mounted on the same shaft. The use of direct current also gives very good results. It is possible to wipe out all the waves in the primary after the first half-pulse period, and the secondary oscillates in its own natural frequency. The coupling employed in this case is about 20 per cent., and between two or three oscillations take place before the spark is quenched. This method, however, does not allow for double tuning, nor can such great powers be dealt with. The use of continuous waves requires an arc, high frequency alternator or similar method, such as that of getting a single-phase current of triple frequency from a three-phase transformer, the iron of which is highly saturated. Ordinary detectors cannot detect continuous waves, so a vibrating contact known as a ticker is included in the circuit. Tuning is not possible, and also atmospheric waves cannot be so easily distinguished from the signals. Continuous waves are of most use for wireless telephony, but there is great difficulty experienced with the microphone. Dr. Goldschmidt's suggestion of using a microphone in the exciting circuit of his alternator is very hopeful. Of the methods which have been employed to eliminate atmospheric disturbances, the best is that in which two Fleming valves or two crystal detectors are used in parallel, connected in opposite directions and appropriately polarised so that one valve will rectify small alternating currents and the other will not. If a large voltage is applied, the current through the two valves is of almost equal value. Instead of a noise in the telephone, a portion of the signal is simply wiped out.

At the Council Meeting of the I.E.E. last Thursday, Dr. Alexander Graham Bell was elected an Honorary Member.

The question of the distribution of the remaining £60,000 of the National Telephone Co.'s assets will be dealt with by Mr. Justice Sargant in the Chancery Division on Monday.

The Sitka-Valdez cable failed on the 3rd inst., and on the 4th all communication to all places in the Mexican State of Chihuahua by all routes ceased.—The Cape St. Jacques-Pontianak cable is also interrupted between the former place and Paulo Condore.—The Eastern Telegraph Co. on the 9th inst. announced that the new cable between Aden and Colombo is open.—The c.s. *Mackay-Bennett* is overhauling the shore ends at Waterville of the Commercial Cable Co.

# "ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

## Specifications Published December 4th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

**Names in italics indicate communicators of inventions from abroad.**  
18,300/12. **Seal for Quartz Envelope and Metallic Conductor.** B.T.-H. Co. (*G. E. Co., U.S.A.*). A low expansion glass is mixed with progressively larger quantities of silica to make a series of melts. The glass is finely powdered, and ground quartz added. The different glasses resulting are used successively from the quartz tube till a glass having the same expansion as tungsten is available. A tungsten or molybdenum leading-in wire fused into this makes a vacuum-tight seal. Two figures.

25,418/12. **Indicating Speed of Trains.** H. F. C. WHITEHEAD. The vibrations resulting from the passage of a vehicle over rail joints are used to close an electrical circuit and mark a moving paper. Four figures.

25,861/12. **Vehicle Lighting.** J. DE COSTER. The charging of the accumulator by the dynamo and the lighting circuits are controlled from a switchboard. To prevent over-charging, a single resistance coil is inserted in the dynamo field circuit. A multi-way switch is used to cut the dynamo out, and to connect it in circuit with or without the shunt resistance. Two figures.

27,432/12. **Incandescent Lamps.** B.T.-H. Co. (*A.E.G.*). A quantity of gas at very low pressure is kept constant throughout the life of the lamp by previously impregnating a definite porous body with the gas-producing material, and inserting this in the lamp, e.g., a very small tube of silicic acid and an organic binder are boiled in chloride of copper, then dried and drawn into wire, which is mounted in the lamp.

4,514/13. **Directive Aerials.** MARCONI Co. and C. S. FRANKLIN. A closed circuit is arranged in a vertical plane with a number of equidistant condensers inserted so that each compensates for the inductance between itself and the next condenser. The two extreme parts of the aerial are separated by half a wave-length, so that it becomes a powerful radiator and absorber, and has good directional properties.

14,711/13. **Military Projectors.** J. Y. JOHNSON. (*F.I.A.T. Fabbrica Italiana Automobili Torino and Soc. Anon. Officine Galileo, Italy*). Mirrors movable on both horizontal and vertical axes are used. An upper mirror is mounted on a telescopic support, and the height is adjusted from the ground. The mirror is controlled from a distance independently of the lighting generator through a motor. Thus the mirror can be lowered, re-elevated, and rapidly put into service again in case of damage. Two figures.

## Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Summaries of some of the more important of these patents will appear in our next issue.

**Arc Lamps:** PEARCE and WILKINSON [Globes] 6,965/13.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** WILSON [Storage battery charging] 26,752/12; LAKE (*Randall and Cook*) [Wire covering machines] 27,221/12; PUCEL [Alarms for protection of conduits and mains] 3,335/12; GILES [Lightning arresters] 6,359/13.

**Dynamos, Motors and Transformers:** BOSH [Mounting brush holders] 9,264/13; ANDREWS and KETCHUM, 17,725/13.

**Electrometallurgy and Electrochemistry:** LOBECK [Sterilising milk] 18,834/12; SHELMEIDINE [Sterilising milk] 26,743/12; HELFENSTEIN [Arc furnace] 2,577/13; HELFENSTEIN ELEKTRO-OFEN-GES. [Furnace with upper charging chutes] 9,590/13; KRUPP A. G. [Furnace electrodes] 17,925/13.

**Heating and Cooking:** SCHOFIELD [Wash-boilers, &c.] 21,209/12; WHISH [Composite material for heating elements, rheostats, &c.] 23,429/12; JORDAN [Radiators, also thermogalvanometers] 26,631/12; MICHIE and PAGET [Heating and lighting] 3,864/13.

**Ignition:** SEROPIAN [Self-starter] 26,603/12.

**Incandescent Lamps:** QUAIN, 26,548/12.

**Instruments and Meters:** HAMILTON and FERRANTI, LTD. [Prepayment mechanism] 26,358/12.

**Switchgear, Fuses and Fittings:** FERRY, BIGWOOD and BROTHERTON TUBES & CONDUITS [Conduit junction boxes] 26,953/12; MARTYN [Terminals] 79/13; RAILING and MAURICE [Slade carrier] 1,286/13; WILDEY [Contacts] 1,471/13; CONNER [Switching for automobile lamps] 3,987/13.

**Telephony and Telegraphy:** DEGENHARDT [Automatic telephones] 26,499/12; LODGE [Unidirectional H.P. discharges] 29,268/12; SIEMENS BROS. (*Siemens & Halske*) [Telephone exchanges] 9,169/13; UDE [Telephone fixtures] 10,556/13; SIEMENS & HALSKE [Telephone circuits] 12,061/13 and 19,928/13, STERLING

TELEPHONE & ELEC. Co. and ALLCOCK [Radial selector switches] 15,566/13; RAPPENECKER [Transmitters for telegraph copying apparatus] 19,939/13; TIETGEN [Multiple telephony] 20,822/13.

**Miscellaneous:** B.T.-H. Co. (*A.E.G.*) [Distant transmission of positions] 27,312/12; MERRYLEES [Non-conducting coverings] 27,344/12; BAILEY & NAVALTUM [Aluminium solder] 27,835/12; MORISOT [Compresses] 29,176/12; ROZE DES ORDONS [Wireless clock-synchronising] 6,192/13; WOLF [Miners' safety lamps] 6,700/13; ERSTE SUDDEUTSCHE MANOMETERBAU ANSTALT UND FEDER TRIEBWERKFABRIK J. C. ECKHARDT [Indicating when a vehicle is in or removed from its shed] 8,508/13; DUNNE [Automatic alarms] 10,900/13; MARKS (*Maschinenbau-Anstalt Humboldt*) [Rotary magnetic separators] 11,430/13; GES. FÜR NAUTISCHE INSTRUMENTE [Gyro-compasses] 11,988/13; PEDERSEN [Gearing] 22,579/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, &c.:** KETTERING [Control for] 7,546/13.

**Heating and Cooking:** CAMPBELL [Heating units and resistance coils] 15,014/13.

**Ignition:** RUSHMORE [Starting-motors] 29,932/12; MAILLAN [Distributing] 26,028/13.

**Switchgear:** COLAS [Contacts] 26,268/13.

**Telephony and Telegraphy:** SIEMENS & HALSKE [Circuit arrangements for connectors with multiple connections] 21,222/13.

**Miscellaneous:** DUIVEN [Preparation of electric baths] 25,668/13.

## Grant of Patent Allowed

9,673/12. **Direction "Tell-Tales."** J. C. CLARKE and CHADBURN'S (SHIP) TELEGRAPH Co. Subject to amendment, the Comptroller has allowed the grant of this patent, which is for a means of indicating whether orders transmitted by a ship's telegraph are carried out.

## Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

24,450 of December 8th, 1899. **Automatic Telegraph Transmitters.** J. A. L. DEARLOVE and S. G. BROWN. An improved construction of automatic curbing transmitter for submarine telegraph circuits is described. The transmitting levers have arms to co-operate with the toothed end of a spring carried by an oscillating lever, so that when the needle of one lever enters a perforation in the tape this lever makes contact with a contact point carried by the oscillating lever and connected to a battery terminal, while the other transmitting lever makes contact with a fixed contact point connected to the other battery terminal. The reversing levers are pivoted to a movable plate, and have their free ends connected by an insulating link, and are oscillated by a rocking contact arm pivoted to the movable plate and flexibly connected to a rotary crank pin. A driving motor with centrifugal governor is also described.

24,718 of December 12th, 1899. **Common Battery Telephony.** J. E. KINGSBURY (*W.E. Co., U.S.A.*). A highly inductive shunt of low resistance is inserted across the terminals of a subscriber's receiver or transmitter so that a special signalling battery is not required. There are 16 claims dealing with the necessary circuit connections for ordinary, "exchange extensions," and "private extensions."

The following are the more important Patents that have become void through non-payment of renewal fees.

**Arc Lamps:** W. G. HEYS (*Scott Elec. Co., U.S.A.*) [Flame arcs with inclined carbons] 18,742/07.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** H. H. LAKE (*G. Semenza, Italy*) [Capped insulators for H.P. lines] 18,408/06; E. C. R. MARKS (*Federal Electric Co., U.S.A.*) [Insulating bushes] 18,659/06.

**Dynamos, Motors and Transformers:** SIEMENS DYNAMO WORKS (*Siemens-Schuckert*) [Commutator cooling] 17,417/08.

**Heating and Cooking:** W. A. PHILLIPS and F. R. BACON [Resistor for heaters, rheostats, &c.] 17,340/08.

**Incandescent Lamps:** A. LEDERER [Pressed tungsten filaments] 18,738/06.

**Telephony and Telegraphy:** MARCONI Co. and E. PRIDDLE [Trembler] 16,656/05; G. W. GIBBERD and O. A. ELIAS [Disinfecting telephones] 17,612/08.

**Traction:** SIEMENS BROS. (*Siemens & Halske*) [Relay for D.C. track circuits] 17,348/08.

**Miscellaneous:** W. FAIRWEATHER (*Arnold Magnetic Clutch Co., U.S.A.*) [Clutch for throwing load gradually on to A.C. motors] 17,741/04; C. WIENER [Perforated sheet music recording and reproducing] 17,269/08.

**DO YOU USE  
LARGE  
MOTORS?**

**INSIST ON**

**'IGRANIC'**

**MULTIPLE LEVER  
STARTERS!**

**IGRANIC ELECTRIC Co. Ltd.  
LONDON and BEDFORD.**

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONER:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competition replies in this column.

**ANSWERER:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,367.

The composition of an oil-resisting alloy is required, suitable for cast metal tanks, for use with oil-immersed apparatus; the alloy must have been found successful in practice, and be inexpensive to make. Any special foundry precautions should be stated. "H. R."

(The time for replies to this question has been extended to next post, Tuesday, December 18th.)

### ANSWERS TO No. 1,366.

During a sharp thunderstorm the telephone on the ground floor in a private house using electric light from the supply mains was struck by lightning. It was afterwards found that five of the metal filament lamps had their filaments completely shattered. The lamps were not in use at the time; there was not the least sign of blackening, no fuses whatever were blown, nor was there any trace of damage to the electric lighting installation. How would you account for this failure of the lamps? "F. T."

The first award (10s.) is given to "R. A. M." for the following reply:

The absence of lamp blackening indicates that the filament failure was caused by mechanical stresses, and not by excessive current. The effect of the lightning discharge would be to create electromagnetic and electrostatic fields of varying intensity in the neighbourhood of the telephone wiring, in wires, and of the instrument itself, it being assumed that the lightning went to earth at the protective gear contained in the house.

A sudden induced voltage of the filaments might be the result of stresses due to (1) electromagnetic induction of (2) electrostatic induction.

The first induced voltage of (1) it would be necessary to consider the filaments as being connected to a single wire, and so the effect of the lightning stroke would be to create a sudden induced voltage of the filaments.

The second induced voltage of (2) it would be necessary to consider the filaments as being connected to a single wire, and so the effect of the lightning stroke would be to create a sudden induced voltage of the filaments.

clude that the electrostatic effect above-mentioned is responsible for the phenomenon.

The second award (5s.) is made to "MARP," who, after dismissing the possible cause of concussion due to the sound wave of the thunderclap, proceeds as follows:—

The probable explanation is that the large quantity of atmospheric electricity which was necessary to have produced the disturbance of the telephone circuit, gave rise to an electric "field" of considerable strength for some yards round the centre of the disturbance. The action of this "field" was such as to cause the filaments to repel one another, like the leaves of a gold-leaf electroscope, and the consequent strain was sufficient to shatter them. To realise that such an effect can, and does, take place, it is only necessary to electrify a small strip of brown paper (by first heating slightly to expel moisture, and then drawing briskly through the folds of a piece of flannel), and then to bring it within an inch or so of an electric lamp. The filaments will be seen to open out quite perceptibly; in fact, with a carbon lamp they can be caused almost to touch the sides of the bulb. Imagine such an effect to be increased a hundred-fold and to occur with the rapidity of a lightning flash, and picture the result.

Among other replies received, that of "H. H." proposes a slightly different explanation, and is given below:—

The trouble experienced by "F.T." is one of many peculiar effects produced by lightning. In this case the telephone line, when struck by lightning, had a high-frequency static charge induced in it, which would discharge to earth, and at the same time it would induce a lower frequency oscillation or surge into the lamp circuit with disastrous results. It is not stated whether the lamps which were broken were a group consisting of one circuit, which is most likely the case, and also nearest to the telephone line. Similar cases to this have occurred when a wireless telegraph transmitting station has been close to houses where electric light is installed, and where fuses have blown and the wiring burnt out when the wireless station has been transmitting. Cases have also been known where high voltages have been induced even when the main switch has been open, showing that the high voltages were being induced from the antennae.

## ANSWERS TO CORRESPONDENTS

"W. A. R."—You certainly cannot assume that it would be possible for you to import lamps direct from Germany and sell them in this country without risk of patent proceedings being taken against you.

**The Northampton Polytechnic Institute.**—The annual prize distribution and students' conversation was held last Friday when the prizes and certificates were presented by Mr. J. S. Cope, Chairman of the London County Council. There was an organ recital, and choral concert, and a series of lectures were given, including one by Mr. S. Field, head of the Chemistry Department, on artificial nitrites, illustrated by demonstrations of new electric batteries by Mr. E. Kitchin, Esq. All the laboratories were open to inspection. The conversation was continued on Saturday evening, when the lecture on artificial nitrites was repeated, and an orchestral concert was given.

**Essay Competition.**—The London Natural History and Antiquarian Field Club announces that a medal and prize will be awarded for the best Paper on "The Influence of Natural Forces on the Economic Production of Electricity in the Future, Home and Foreign Purposes," during the Session to be held at the Northampton Polytechnic Institute, and submitted before March 1st, 1914. For particulars, and to see the rules, apply to Mr. H. Fielding, London County Council, 100, Abchurch Lane, London, E.C. 4.

**The Royal Institution.**—Among the Friday evening lectures to be given by Mr. H. Fielding, Esq., on the subject of "The Influence of Natural Forces on the Economic Production of Electricity in the Future, Home and Foreign Purposes," during the Session to be held at the Northampton Polytechnic Institute, and submitted before March 1st, 1914. For particulars, and to see the rules, apply to Mr. H. Fielding, London County Council, 100, Abchurch Lane, London, E.C. 4.

## "ELECTRICAL ENGINEERING" LITERARY SECTION

### NEW PUBLICATIONS

*We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.*

"The Management of Public Electric Supply Undertakings," by A. H. Seabrook. 192 pp. 9½ in. by 6½ in. (London: *Electrical Times*, Ltd.) 7s. 6d. net; abroad, 7s. 11d.

"Switchgear and the Control of Electric Light and Power Circuits," by A. G. Collis. 85 pp. 6½ in. by 4½ in. 47 figures. (London: Constable & Co., Ltd.) 1s. net; by post, 1s. 1½d. (*Electrical Installation Manual*.)

"Electric Circuit Theory and Calculations," by W. P. Maycock. 855 pp. 7½ in. by 5 in. 120 figures. (London: Whittaker & Co.) 3s. 6d. net; abroad, 8s. 11d.

"Wireless Telegraphy and Telephony without Wires." By C. R. Gibson. 156 pp. 8 in. by 5½ in. 19 figures. (London: Seeley, Service & Co., Ltd.) 2s. net; by post, 2s. 3d.

"Overhead Electric Power Transmission." By A. Still. 310 pp. 9½ in. by 6½ in. 115 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 12s. 6d. net.

"Transformer Practice." By W. T. Taylor. 278 pp. 9½ in. by 6½ in. 191 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) Second edition. 10s. 6d. net.

"Electricity in the Service of Man." Vol. II., Section 1, Technology of Electricity. By R. M. Walsley. 686 pp. 9½ in. by 6½ in. 691 figures. 11 plates. (London: Cassell and Co., Ltd.) 7s. 6d. net; abroad, 8s. 6d.

### REVIEWS OF BOOKS

**The Management of Public Electric Supply Undertakings.** By A. H. Seabrook. 192 pp. 9½ in. by 6½ in. (London: *Electrical Times*, Ltd.) 7s. 6d. net.; abroad, 7s. 11d.

Mr. Seabrook's tireless energy and love of organisation are well known to all our readers who take an interest in public electric supply undertakings, and the notable results which he has achieved at West Ham and Marylebone certainly qualify him to speak with authority on central station management. The substance of the book before us was embodied in a series of lectures given last winter at the East London College, which were reported in *ELECTRICAL ENGINEERING* at the time. Many will be glad, however, to have the author's views in book form, and no one, whether they see eye to eye with him from all points of view or not, will lay down the volume without having been deeply interested. Mr. Seabrook will not mind our saying that he shines more as a manager than as a *littérateur*. Sometimes he is needlessly diffuse in his explanations, and sometimes his style is a little jerky, and this feature is intensified by the unkind treatment he has received from the printers, who have arranged almost all the sentences as separate paragraphs, with white spaces in between. We will not dwell here too much on the scheme of the contents, as those who followed the reports of the original lectures will know pretty much what ground is covered. We must remark, however, that there is a great deal of general matter, such as the relations of employer to employed, which has little to do with electric supply in particular, but is common to all businesses, and, indeed, common knowledge, if not simply common sense. Nevertheless, Mr. Seabrook treats it all with a characteristic freshness, and we do not regret having seen it expounded as part of his philosophy. In the part of the book relating specifically to electric supply management, he gives us a detailed account of the methods which he employs at Marylebone, where the keynote is system, thoroughness and possibility for the chief to get in touch with the smallest details when required. Many will regard his multiplicity of printed forms and rubber stamps with distaste, and even amusement, but it must be remembered that no two undertakings are the same. Methods which suit one would not suit another. Again, much depends on the personalities of the men in control. Some staffs can do their work better fenced in with elaborate formalities, and would become untidy and purposeless without them, while others would chafe in such a harness, and require a freer system. The portion relating to the sales department will be read with great interest by all supply managers, and those who

London: Crosby Lockwood & Son  
7, Stationers' Hall Court, E.C., & 5, Broadway, Westminster, S.W.

are not weary of the subject will appreciate the chapters on tariff systems. Mr. Seabrook has conferred a benefit on his brother central station men by giving freely of the results of his experience, and has interested them with a revelation of his philosophy. Whether all will find his methods suitable for adoption, or will agree with all his views, is another matter. His object in writing the book will have been more than half achieved if he infuses his enthusiasm into his readers and makes them always realise that sound business methods are as essential in electric supply undertakings as in any other enterprise.

**Switches and Switchgear.** By R. Edler. Translated by Ph. Laubach. 401 pp. 9 in. by 6 in. 365 figures. (London: Constable & Co., Ltd.) 15s. net; abroad, 16s.

This is an English translation of a standard German work on switchgear, and is essentially a professor's book rather than a workshop or drawing office treatise. Numerous standard pieces of apparatus have been selected, and their theory and principles of design have been carefully explained and developed by the aid of elementary mathematics, though occasionally the calculus crops up. Of course, a work of this character cannot hope to deal with up-to-date apparatus, as the theory must limp painfully after the actual application, but at the same time the principles enumerated should be sound for all time.

To English readers quite a number of apparatus appears strange and unfamiliar, particularly the air-break H.T. switches for pole-mounting; nevertheless they have done and are still doing excellent service on Continental overhead systems. They are described at considerable length, but although low-tension switches of various kinds are also described, the heavy current types are rather inadequately treated. Oil switches are despatched in eleven lines, and their advantages over other types are set out under ten heads, from the last of which we extract: "Oil switches can be used, indeed, in places not entirely fireproof; even, perhaps, in places where there is direct danger from fire." British and American engineers have other views.

The design of fuses is well treated, particularly those of the tubular pattern, but relays and circuit breakers are dismissed rather hurriedly. Over 220 pages are devoted to motor starters, controllers and their resistances, their theory being clearly set out in an elementary manner.

The work should be useful to students and teachers, but will be of only limited interest to practical workers.

**Electrical Meters.** By C. M. Jansky. 870 pp. 9½ in. by 6½ in. 278 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 10s. 6d. net.

The word meters is used in the title to cover all classes of indicating and recording, as well as integrating instruments. The author, in his preface, discounts one very obvious criticism by the following sentence:—"Since, in this country, instruments of foreign make are used to such a limited extent, this work is confined almost entirely to instruments made in the United States, and to American practice." As the result, one looks in vain for a description of such an instrument as the ohmmeter, so indispensable in this country, and the use of which is becoming much more common in the States. Again, the deflectional electro-dynamometer ammeter, so much used in Germany, and to a smaller extent in this country, is barely alluded to. A serious drawback from the point of view of the student, to whom the work is professedly addressed, lies in a certain looseness of expression, verging in some instances on inaccuracy. Thus the author says: "The square root of the mean square value is called the effective value, and is the value given by all alternating-current instruments." Although certainly "a consummation devoutly to be wished," it is unfortunately not always attained. The author seems to have made good use of the space at his disposal, although at the same time it would hardly appear necessary to inform the reader in a book on so special a subject that "the resistance of a conductor is analogous to the resistance a water-pipe offers to the flow of water." Again, some seven pages are devoted to a description of the mercury ammeter, which, whilst undoubtedly a very ingenious instrument, hardly warrants so lengthy a description. On the other hand, only half a page is allotted to the extremely important subject of current and potential transformers upon which concise information is badly wanted.

The sections devoted to induction-type ammeters, voltmeters and wattmeters are particularly good and should serve to make clear the principles upon which these instru-

ments work. The chapters at the end dealing with testing and with the errors to which various instruments are susceptible will also be found interesting, if possibly somewhat diffuse. The usefulness of the volume would have been much increased had references been given to the source of some of the information, and also as indicating where further details could be obtained. Such remarks as, "According to one writer," and so forth, are somewhat unsatisfactory. The author's method of classification leaves something to be desired. He classes as "Electro-Magnetic" instruments of the moving iron, permanent magnet moving coil and induction types, while "Electro-Dynamic" instruments are "those whose actuating forces are due to currents flowing through the coils without iron cores." It might be asked in which category he would place a moving coil instrument provided with an electro-magnet in place of a permanent magnet; or again, a dynamometer instrument having an iron core. As regards the latter, it seems a pity to emphasise the distinction between dynamometer instruments with and without iron, now that it has been shown by Drysdale and others that, provided proper precautions are taken, iron can be introduced without in any way interfering with the electrical properties of the instrument. To those in search of a single volume containing information on the whole subject of "Meters," both Indicating, Integrating and Graphic, but exclusively of American origin, this book should prove valuable. To the English "student" it will hardly appeal.

**Overhead Electric Power Transmission.** By A. Still. 310 pp. 9½ in. by 6½ in. 115 figures. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 12s. 6d. net.

THE author of this book is a well-known authority on transmission line problems, and in the present volume he has succeeded in combining theory and practice in a most praiseworthy manner. The calculations for the design of overhead transmission lines are worked through with the aid of only the most elementary mathematics, and, in each case, the practical aspects of the problem are thoroughly discussed. Thus in applying Kelvin's Law for the determination of the most economical conductor section, the author deals fully with the unit value, which should be taken for the energy lost in transmission in different circumstances, the most difficult, but yet the most important, factor in the argument. The influence of the transmission line voltage on the relative cost of the rest of the power system is also discussed. Approximate methods of calculating the regulation of transmission lines, the influence of the line characteristics on resonance effects and surges, and other similar problems are clearly dealt with. The chapter on insulation and lightning protection is most interesting reading, but the author devotes far too small a space to the theory of the suspension insulator, the peculiar distribution of potential along the string of units being only vaguely referred to. Some curves illustrating this would have been most helpful. It is refreshing to find an American author who is not wholly wedded to the aluminium arrester for line protection. Mr. Still warns the reader against certain unpleasant effects produced by the aluminium arrester, and suggests that in many cases the less costly arrangement of a series of horn-gaps, with graded resistances, would be equally effective. A short description is given of the Thury high-tension direct-current transmission system, and the advantages and disadvantages are enumerated. The effects of wind and ice loading of overhead wires are thoroughly discussed, and general rules are laid down for calculations. The appendix includes the calculation of the inductance of unsymmetrically-arranged three-phase conductors, and of the stresses in flexible tower lines, also a model specification for overhead lines.

**Switchgear and the Control of Electric Light and Power Circuits.** By A. G. Collis. 85 pp. 6½ in. by 4½ in. 47 figures. (London: Constable & Co., Ltd.) 1s. net; by post, 1s. 1½d. (Electrical Installation Manual.)

To write a satisfactory treatise on switchgear, including an insight into the intricacies of modern methods of generator and feeder protection in some seventy small pages of large type is not an easy task, and, as might be expected, conciseness is carried rather to excess in the endeavour to cover the whole field. Mr. Collis, however, only wishes this little manual to be regarded as an introduction to his large detailed work recently reviewed in our columns, but it must be said that the way in which he has managed to touch upon many branches of the subject in so small a space is wonderful. He makes good use of diagrams of connections, and divides the subject-matter up under headings in a

convenient way, dealing successively with direct-current switchboards, alternating-current switchboards, and feeder protection. The book is more than a mere *résumé* of standard practice, such as might be given in the form of a series of standard diagrams, and contains not a little comment and expression of opinion, such as should help those desiring a general view of this subject to look at the matter from a reasonable point of view. In dealing with mining switchgear we notice that the author is not in favour of wide flange joints for rendering cases flame-proof. Here his view is certainly at variance with many authorities of wide experience. He strongly urges that all contacts be broken under oil, and quotes extensive experiments of his own to meet such objections as have been advanced against the use of oil switches for direct currents. These experiments entitle him to speak with some authority on oil switches in general, and his remarks in the A.C. section of the book on the enormous pressures that may be developed when circuits carrying large powers are broken under oil are very interesting. He rightly points out the futility of the usual methods of rating the breaking power of circuit breakers in relation to their normal load without taking into account the nature of the rest of the circuit. Various forms of protection are briefly described, but we should have liked to see the Merz-Price system dwelt on a little more, and distinguished by name from other balance systems, and this part of the work extended somewhat even at the expense of the more elementary portions. With many, Mr. Collis views the extreme complication of protective gear as a passing fashion, and rejoices that simplicity in switchgear is coming to its own once more.

**Electric Circuit Theory and Calculations.** By W. P. Maycock. 355 pp. 7½ in. by 5 in. 120 figures. (London: Whitaker & Co.) 8s. 6d. net; abroad, 8s. 11d.

Those who are "weak in figures" may find in this work much of interest and use, but the larger number of students of installation work may prefer something more concise. The book, we are told, is intended for the beginner, and no one would doubt that for a moment, as there is a self-contained section on elementary arithmetic, and the multitudinous examples given in the electrical part are worked through step by step each time. But little space is devoted to the magnetic circuit, though power calculations for D.C. and A.C. motors are dealt with, and much useful information for those not well versed in the subject may be found on insulators, cables, distributing systems, heating, light, illumination, insulation testing, &c. The author strives to emphasise the meanings to be attached to different technical terms in common use, and in so doing rather spoils the literary merits of an otherwise well written, if prolix, book. It seems wrong to assume that the reader is more likely to have a knowledge of elementary electricity and magnetism, and yet not know how to multiply and divide decimal fractions. Broadly speaking, the requirements of the City and Guilds, Grade I. and Final, examinations in electric wiremen's work are met, though it is not the object of the book to prepare for examinations only.

**Wireless Telegraphy and Telephony without Wires.** By C. R. Gibson. 156 pp. 8 in. by 5½ in. 19 figures. (London: Seeley, Service & Co., Ltd.) 2s. net; 2s. 8d.

The author of this work has previously written a number of books on popular science which have been well received, and the volume now under consideration will no doubt add to his reputation in this field. The matter is well arranged and reproduced, and clear diagrams and photographs are given. Considering the ground covered, a remarkably clear and concise account of the rise of wireless to its present important position is given, and as no knowledge of electrical matters is assumed, the author deftly enables the reader to form a mental picture of the chief actions which are taking place. For this purpose he is early introduced to the rudiments of the electron theory as we know it to-day. In addition to a full index, a glossary of the terms used is given, as well as a *résumé* of the more important discoveries and events relating to wireless from 1881 to 1918.

**The Principles of the Application of Power to Road Transport.** By H. E. Wimperis. 130 pp. 7½ in. by 5½ in. 24 figures. (London: Constable & Co., Ltd.) 4s. 6d. net; abroad, 4s. 9d.

We have here in book form the substance of a series of lectures given at Finsbury Technical College by the author recently, and a readable and useful manual to put our ideas in order regarding the mechanics of locomotion. Mr. Wimperis has made a special hobby of this subject, and

## Whittaker's Practical Handbooks

### THE DESIGN OF ALTERNATING CURRENT MACHINERY.

By J. R. BARR, A.M.I.E.E., late lecturer in Electrical Engineering at Heriot-Watt College, Edinburgh, and R. D. ARCHIBALD, A.M.I.C.E., A.M.I.E.E., head of the Electrical Engineering Department, Dundee Technical College. With 340 Illustrations and 17 Large Working Drawings. Med. 8vo. **12s. 6d.** net (postage 5d.).

### PRINCIPLES OF DIRECT CURRENT ELECTRICAL ENGINEERING.

By JAMES R. BARR, A.M.I.E.E. With 294 Illustrations. **10s.** net (postage 5d.).

### ARMATURE CONSTRUCTION. A Practical Handbook for Electrical Engineers.

By H. M. HOBART, M.I.C.E., M.I.E.E., and A. G. ELLIS, A.C.G.I. With 420 Illustrations. **15s.** net (postage 5d.).

*The Diagrams of Polyphase Windings and Multiplex Continuous-Current Windings are printed in different colours in this book.*

### ELECTRIC WIRING, FITTINGS, SWITCHES AND LAMPS (CIRCUITS).

A Practical Book for Electric Light Engineers and Contractors, Consulting Engineers, Wiremen and Students. By W. PERREN MAYCOCK, M.I.E.E. Fourth Edition, entirely re-written. With 600 Illustrations. **6s.** net. (postage 4d.).

### ELECTRIC LIGHTING AND POWER DISTRIBUTION.

An Elementary Manual of Electrical Engineering. By W. PERREN MAYCOCK, M.I.E.E.

Vol. I. Seventh Edition. Revised. With 331 Illustrations. **6s.** net (postage 5d.).

Vol. II. With 407 Illustrations. **6s. 6d.** net (postage 5d.).

### CENTRAL STATION ELECTRICITY SUPPLY.

By A. GAY, M.I.E.E., and C. H. YEAMAN, A.I.E.E. Second Edition, re-written and revised. With 278 Illustrations. **10s. 6d.** net (postage 4d.).

### SINGLE-PHASE COMMUTATOR MOTORS.

By F. PUNGA. With 81 Illustrations. **4s. 6d.** net (postage 4d.).

### ELECTRIC WIRING DIAGRAMS.

Illustrating Circuit-connections for Supply Mains, Distribution Boards, Transformers, Lamps, Heaters, Motors, Bells, Private Generating Plant, &c., &c. With brief Explanations of the Diagrams. By W. PERREN MAYCOCK, M.I.E.E. With 246 Illustrations. **2s. 6d.** net (postage 3d.).

Catalogue Books on Electricity, Engineering, etc., Post Free.

**WHITTAKER & CO.,** 2, White Hart St., LONDON, E.C. Paternoster Sq.

with the aid of his ingenious accelerometer has done much valuable quantitative work regarding horse power developed, absorbed and utilised in automobiles. The methods adopted are explained here, and the whole mechanics presented with remarkable clearness. A great part of the book is devoted to matters connected with petrol cars, but in the last chapter petrol-electric systems and trolley omnibuses (which we are glad to see are not called "trackless") are dealt with briefly.

**Natural Sources of Energy.** By A. H. Gibson. 131 pp., 6½ in. by 5 in. 17 figures. (Cambridge: The University Press.) **1s.** net; by post, **1s. 2d.** (Cambridge Manual.)

IN this addition to the series of semi-popular "Cambridge Manuals of Science and Literature," Prof. Gibson, of Dundee, takes up the question of depletion of our coal resources, and discusses the suitability of other available sources of energy. What will happen, he thinks, is that the price of coal will rise steadily until it reaches a point at which other sources of energy, at present more costly and less convenient, will be able to compete on equal terms. With regard to oil fuel, he says that probably the oil-bearing strata will be exhausted long before the coalfields. The supply of natural gas will also give out quite soon, and he does not expect that peat will relieve the demand for coal and oil to an appreciable extent. After some notes on the transformation of energy generally, he discusses the utilisation of fossil fields in more detail, and passes on to deal successively with the possibilities of sun power, vegetable fuel, such as alcohol, the internal heat of the earth, water power, tidal power, and wind power. The only one he rules out entirely is the internal heat of the earth, but he is sceptical also as regards windmills. Finally, he arrives at the comforting conclusion that even when the fossil fuels are exhausted, ample supplies of energy, renewable year by year, will remain for all the conceivable activities of the human race. The general distribution of activity on the earth's surface will, however, be much modified, and isolated communities must inevitably suffer.

**Dynamo and Motor Attendants and their Machines.** By F. Broadbent. 160 pp. 7½ in. by 5 in. 82 figures. (London: S. Rentell and Co., Ltd.) 7th edition. **1s. 6d.** net; by post, **1s. 9d.**

The popularity of this well-known handbook for the dynamo attendant is such that a seventh edition has followed rapidly on the sixth, so rapidly that Mr. Broadbent complains that he has scarcely had time to adopt all the suggestions for improve-

ments that he would have liked. Nevertheless, there has been some considerable revision and a little condensation of the old matter, and the range of the book has been extended to include motors as well as dynamos. The book is thoroughly practical and easily intelligible, and contains much that should be of use to those who are not trained experts but have charge of electrical machinery.

**The "Mechanical World" Pocket Diary and Year Book for 1914.** 443 pp. 6½ in. by 4½ in. 71 figures. (Manchester: Emmott and Co., Ltd.) **6d.** net; by post, **8d.**

One of the principal new features of the 1914 edition of this excellent little pocket-book is the re-written section on steam turbines, by Mr. R. M. Neilson. Various other mechanical matters have had their treatment extended and brought up to date, and year by year the volume grows in size, becoming an even more wonderful sixpennyworth than before. Electrical engineering is dealt with in a companion pocket-book.

**"Mechanical World" Electrical Pocket Book for 1914.** 240 pp. 6½ in. by 4 in. 129 figures. (Manchester: Emmott and Co., Ltd.) **6d.** net; by post, **8d.**

For several years now the *Mechanical World* Electrical Pocket Book has been issued in a separate volume from its companion on mechanical and general engineering matters, and it has grown considerably in size since its first separate issue. Even since last year several sections have been re-written and new sections added. Thus the treatment of telephones, electrical equipment of ships, lifting magnets, dry batteries, sparking distances in air, and burglar alarms is new, the section on electricity in coal mines has been re-written, and additions and extensions have been made to the matter on transmission lines, accumulators, starters, instruments, bells, and lighting. It will thus be seen that every endeavour has been used to keep this wonderful sixpennyworth thoroughly up to date. Perhaps a little more might have been said of the Edison accumulator, owing to its growing importance. Probably this will be done in the next edition, which will doubtless also contain information as to the "half-watt" lamp, which presumably only made its appearance after the work had gone to press.

**Statistik über Starkstromanlagen.** Prepared by the Schweizerischer Elektrotechnischer Verein and the Schweizerischer Elektrizitätswerke. 194 pp. 14 in. by 9 in. (Zurich: Fachschriften-Verlag und Buchdruckerei A.-G.) **9s.** net; by post **10s.**

We have here a painstaking collection of statistical information regarding the public electric supply undertakings of Switzerland, arranged in convenient tables prepared by the Swiss Elektrotechnischer Verein and the Union of Swiss Central Stations. The information in the main tables, however, does not relate to later than 1911. The first table gives general particulars of 248 undertakings, some with their own generating stations, and some taking current in bulk. In the second table the technical particulars of the actual generating stations are set forth, and in the third are found details of substations and distributing systems. Outputs, load factors, and tariff systems form the subjects of the fourth set of tables, in which generating and distributing stations are classified separately. We have next in Table V. details of the numbers of consumers and proportions of the lighting, heating, and power-load, while miscellaneous remarks are included in Table VI. In all we have 114 different columns each for a different item of information. There is also a supplementary table containing the leading particulars of 518 further stations, brought up to 1913, of which either full details could not be obtained, or which started since 1911. At the end some totals and aggregate statistics are given, but these are a little misleading, as they do not include the stations in the supplementary table.

**Deutscher Kalender für Elektrotechniker, 1914.** Edited by G. Dettmar. Part I., 648 pp., 6½ in. by 4 in. 229 figures. Part II., 347 pp., 6½ in. by 4 in. 154 figures. Munich: R. Oldenbourg.) **5s.** net; by post, **5s. 6d.**

HEER DETTMAR has made good use of his facilities as Secretary of the Verband Deutscher Elektrotechniker, and produced a handbook of exceptional value to the German electrical engineer. The thirty-first issue for 1914 has been brought thoroughly up-to-date as regards the rules and standards of the V.D.E., and the help of further experts has been obtained in bringing the text in line with current practice. Thus Dr. Teichmüller has largely re-written the section on high-voltage transmission and the corona effect, while an entirely new section on lightning and surge protection is contributed by Dr. Petersen. The notes on the electrical fixation of atmospheric nitrogen might be revised with advantage in the next issue. An index and a useful diary are included.

**Scientific and Technical Books.**—A new illustrated catalogue containing over 100 pages has just been produced by Crosby Lockwood and Son (7 Stationers' Hall Court, E.C.). The scientific, technical, and industrial books published by Crosby Lockwood and Son are dealt with, and the publishers will be pleased to send a copy post free to all who may be interested.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 709. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**METAL FILAMENT LAMPS.**—A small folder from the Edison and Swan Electric Lighting Co., Ltd., gives the latest reduced prices of Royal Ediswan drawn-wire lamps, and is accompanied by a useful set of address labels for use when corresponding with the firm.

**CALENDARS, &c.**—We have received from Bruce, Peebles and Co. one of their useful desk companions for 1914, consisting of a large blotting pad combined with a reference diary and calendar. In the reference work is also a collection of abridged specifications and approximate price-lists of the firm's manufactures, and illustrations of their works and plant made by them.

**CHRISTMAS NOVELTIES.**—A list just published by the Electrical Co., Ltd. (122-124 Charing Cross Road, W.C.), deals with novelties in signs and illuminations for Christmas. A very attractive sign for display in shops after closing time consists of  $\frac{1}{4}$ -in. plate glass, upon which any inscription can be painted. The inscription is illuminated from an invisible source, and can

call attention to "Robertson" heating lamps, "Pixielite" strip, and "Velveduct" drawn conduit tube.

**CAR LIGHTING DYNAMOS.**—A list from the Electric Battery Co. (62 Eagle Street, High Holborn, W.C.) describes the E.B.C. dynamo car lighting system, which is under the patents of Mr. S. L. Price. In this system the dynamo is provided with a centrifugal clutch, which disengages when the speed rises above the maximum for which the dynamo is designed, while instead of a minimum voltage cut out, a free-wheel arrangement is used, permitting the machine to run as a motor when the speed drops too low for it to maintain its voltage. A neat switchboard is provided with an ammeter and a voltmeter, and accumulators and lamps are also included in the list.

### A SHIP-CLEANING PLANT

WE were afforded the pleasure last week of inspecting the compact ship-cleaning equipment being put on the market by the Torpedo Submarine Ship Cleaner Co., Ltd. (Cecil Chambers West, 76 Strand, W.C.), during its successful use for cleaning the hull of a 3,000-ton steamer, which had made two return trips to South Africa since the previous cleaning. As cleaning operations are carried out in a few hours under water,

SUBMERSIBLE SHIP-CLEANING GEAR.

be hung at any convenient spot in the window like a picture. It is made in two sizes, 12 in. by 6 in. and 16 in. by 10 in. Kaleidoscopic and watertight reflector rosette signs are also listed, as well as decorative flexible illumination chains for electric lamps or candles, and suitable for carbon and "Aegma" lamps.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**HEATING AND COOKING.**—The eleventh edition of the electric heating and cooking list issued by the General Electric Co., Ltd., contains several new appliances not listed in previous additions. The "Magnet" glowing radiators or fires are now made in two types, panel and rod, with a current consumption up to 3,000 watts. Two new designs of lamp radiators in simple and dignified finishes are also shown. Two new types of electric toasters, well finished and nickel-plated, are listed, as is the portable cooker, first shown at the Ideal Home Exhibition. This is constructed of stout sheet metal mounted on a rigid framework, and polished bright. Another novel device is an electrically warmed footstool, while a useful adapter for enabling heating apparatus to be run from a lamp socket without interfering with the lighting is shown. Other leaflets

while the vessel is unloading, the great waste of time necessary for dry-docking and cleaning by hand is avoided, while by cleaning at the completion of each voyage there is never much reduction in speed of the vessel owing to accumulated growth on the hull. Four men only are required. The cleaning is effected by an electrically-driven revolving brush, which is pressed forward against the ship's side by a propeller driven from the motor which rotates the brushes. The complete plant is carried on a flat-bottomed wooden barge 30 ft. long by 12 ft. beam. An electric winch and controlling gear are situated amidships, while aft is the engine-room. Here there is a four-cylinder petrol engine driving a 10-kw. 230-volt compound-wound interpole dynamo at 800 r.p.m. Here also is a 10-h.p. compound-wound motor driving the propeller of the barge, which can attain a speed of 5 knots. The winch has four barrels, and is driven by a  $3\frac{1}{2}$ -h.p. compound-wound motor. It has four drums, one for the cable conveying power to the brushing motor, two for hoisting, and one for "topping," i.e., raising and lowering the jib. An interlocked controller giving five speeds is used. The actual cleaning gear (see illustration) consists of a gun-metal and aluminium bronze framework, carrying a revolving brush 1 ft. diameter and 5 ft. long, having fibre bristles  $2\frac{1}{4}$  in. long. These are made in three strengths, according to the growth on the vessel. The motor, which is of the interpole shunt-wound type, runs at 2,500/2,700 r.p.m., and is geared to the propeller through a combination of epicyclic and worm and chain gearing, reducing the speed of the brush to 250/280 r.p.m. The same motor drives

# INVERLITE

Semi-inverted fittings give that restful glow so essential to good work. They are used in many technical schools, drawing and general offices, and are giving excellent results.

Price 9s., List

## WARDLE

ENGINEERING CO., LTD.,

196 DEANS GATE, MANCHESTER

London: NATHAN & ALLEN, Queen Anne's Chambers, S.W.

the brush at a speed of 150/170 r.p.m. The thrust of the propeller ensures that the brush is in all positions pressed well against the side of the vessel. By means of two air chambers the weight of the submersible part is reduced from 800 lbs. in air to 180 lbs. when submerged. The electrical equipment was carried out by Bruce Peebles & Co., Ltd. "Cab-tyre" sheathed cable is used. The method of cleaning is to moor the barge fore and aft alongside the vessel to be cleaned, from which it is kept about 6 ft. away by means of booms. The jib is then lowered till it touches the vessel's side. The brush motor is then started. The depth to which the brushing gear is immersed is registered by means of a gauge on the wind, and even if the brushing gear overshoots the bilge keel it is pressed against the vessel. As soon as a vertical strip is cleaned the barge moves along nearly a brush's length, and the next strip is cleaned, and so on. Means are provided for adjusting the pressure of the brush on the vessel, as well as for adjusting the angle of suspension and for altering the action of the winch if necessary. It is a valuable property of the brushing gear that as it works under water the actual swirling action of the water helps in great measure the thorough removal of all foreign matter from the vessel being cleaned, and yet the brush is soft enough not to cause any damage.

### DRY HAND FIRE EXTINGUISHERS

WE have recently had the opportunity of examining a new dry hand fire extinguisher, known as the "Clou" fire extinguisher, which is being put on the market at 244 High Holborn, W.C. This acts by throwing a special powder on to the seat of the fire, which is remarkably effective in extinguishing in cases of flames from burning petrol oil, celluloid, &c., where the use of liquids has not quite the same effect. The form of the containing vessel from which the powder is thrown is such that all the contents are not discharged all at once, but the powder can be shot on to the fire in a steady stream. For short-circuits the system has much to recommend it. We are told that the apparatus is extensively used abroad, and has been taken up by the German Navy and Aircraft Department. A striking demonstration, when a motor-car fire was rapidly extinguished, was given at the Aldwych site a few days ago.

### THE IMPORTANCE OF RUNNING LAMPS AT THE PROPER EFFICIENCY

IT is pointed out by the British Thomson-Houston Co. (Mazda House, 77 Upper Thames Street, E.C.) that the question of the actual efficiency at which an incandescent lamp is run has up to now received too little attention. Simply because an incandescent lamp was rated at a certain efficiency by the manufacturer, it was sometimes assumed that this rating would hold, regardless of the conditions under which the lamp operated. The point was often overlooked that the manufacturer's rated efficiency, candle-power, watts, life, &c., only hold when the lamp is used at rated voltage. The entire question of the satisfactory operation of an incandescent lamp of given quality depends upon the one term

FIG. 1.—PERCENTAGE DECREASE IN WATTS CONSUMPTION WHEN MAZDA, GEM, AND CARBON LAMPS ARE UNDER-RUN.

"voltage." It is important that the average voltage at the holder should be the same as the voltage marked on the lamp. Speaking generally, for every 1 per cent. increase of impressed voltage on a given lamp the wattage will increase 1.6 per cent. This means an increase of 1.6 per cent. in wattage for each volt (on 100-volt circuits) that the circuit voltage is increased or the lamp voltage lowered. This 1.6 per cent. increased wattage represents 1.6 per cent. increased revenue. While excessive over-voltage might result in early lamp failures there can be no cause for complaint when lamps are run at rated voltage with a satisfactory commercial life. Let us consider the advantage to the central station of running a 60-watt Mazda lamp at high efficiency instead of at low efficiency. In 500 hours' burning a 60-watt Mazda lamp consumes 30 kw.-hours. If this lamp were operated at 96 volts instead of 100 volts, there would be a loss to the central station of 1.8 kw.-hours. With 10,000 lamps in service, and assuming 500 hours to be the average annual burning period, and the

FIG. 2.—B.T.H. Co's DIAGRAM INDICATING THE USUAL REASONS FOR LOW-SUPPLY PRESSURES.

charge per kw.-hour to be 4d., this would represent an annual loss in revenue of £300. In the majority of cases the purchase of lamps of correct voltage would have prevented this loss in revenue without any increased cost. That is, it would represent 10 per cent. dividend on a £3,000 investment. Provided the low efficiency operation was due to loss in transmission, the lighting company would have been justified in investing £3,000 to obtain this additional revenue. Improving voltage conditions in this manner would not only increase the consumption of lamps, but would have just as important an effect on other apparatus, such as flat irons, toasters, fans, &c. Investigations show that many lamps are operated at from 3 to 4 volts below their rated voltage. The efficient operation of lamps secures the maximum revenue for the central station, the maximum light, economy and satisfaction for the consumer. To ensure efficient results, the central station must keep its voltage constant, and the consumer must use lamps marked with the actual voltage of the supply.

### AN ELECTRIC COMB AND HAIR DRYER

WE illustrate here a new appliance known as the "Plexsim" electric comb, which has been brought out by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), and has been specially designed as a seasonable gift of an original nature. Large stocks have been prepared, and the firm is arranging to supply electricity undertakings and contractors

PLEXSIM ELECTRICALLY HEATED COMB.

with leaflets over-printed with their names and addresses. The heated base of the comb dries the hair in a short time.

### LAMINATED GEARING

WE have recently had the opportunity of examining samples of a gear which is claimed to possess all the advantages of silence that are obtained by raw-hide or helical wheels and silent chains, while even lower in price than ordinary straight cut metal gears. Obviously such a gear, if it lives up to expectations, should have a wide application for motor pinions, gear driving in general machinery, and in automobile work. A typical pair of pinions is shown in the figure, from which it will be seen that each pinion or wheel is made up of toothed laminations with alternate layers staggered half a pitch, and separated by distance washers a few thousandths of an inch thick to give clearance and to avoid binding. By this means the force of the blows of each tooth

coming into contact is lessened—theoretically it should be halved—and a larger number of teeth are in contact at the same time than with ordinary gearing. Again, the laminated construction prevents the metallic ring, which is so large a factor in producing the noise in solid gears. The individual laminations are punched in a notching press, one tooth at a time, like armature stampings, and great accuracy can be obtained at a much less cost than with the elaborate modern gear-cutting machinery required to give solid gear anything approaching quietness. There is no objection to case hardening the teeth, and of course practically any metal can be used. The inventor of this gearing is Mr. A. E. Terry, of Herbert Terry & Sons (Redditch), and we are told that special works are being equipped for its manufacture in Sheffield.

### THE HENLEY WIRING SYSTEM

A NEW two-colour brochure has just been produced by W. T. Henley's Telegraph Works Co., Ltd., dealing with their well-known wiring system, and containing views of a number of buildings where it has been employed. A few of these illustrations are reproduced here. The booklet is written in a non-technical style, and should be useful to contractors in securing new customers for this already popular

SOME BUILDINGS WIRED ON THE HENLEY SYSTEM.

system. We are informed that since this publication has been issued it has been decided to install the Henley wiring system in the workmen's model dwellings now being built on the Duchy of Cornwall Estate, and the wiring is already being put in to those which are sufficiently advanced.

### CASING AND CAPPING

WE have received two more letters in reply to Messrs. C. Jennings & Co.'s inquiry, published in our issue of November 27th.

Messrs. Rawlings Bros., Ltd. (82 Gloucester Road, S.W.) say that their objection to the usual wood casing is that the capping has always been made too thin. They would favour a reduction in the width of the centre fillet so as to give more wood on the edges, with a thicker capping, and especially thicker edges to receive the screws. If Messrs. Jennings, they say, care to send their designs, they will be pleased to criticise them from their point of view.

Mr. Ralph Nance (Cardiff), on the other hand, finds that the standard sizes of casings at present on the market are quite satisfactory, with fixing screws for the capping on the centre fillet on the  $1\frac{1}{2}$  in. size, and on the outer edges on the larger sizes. He approves, however, of the suggestion made by one of our correspondents last week that a groove should be arranged in the capping to mark the position of centre of the fillet underneath, for the fixing screws. Mr. Nance adds:—"I find that a lot of contractors still fix capping with nails, and in taking out old work the nails are often found to have bent and run into the wires. Possibly the nails follow the softest part of the wood."

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Burnley.**—Mains extensions at an estimated cost of £500 are contemplated.

**Carlisle.**—A Local Government Board inquiry is to be held concerning a loan of £23,400 for new generating plant and mains.

**Chesterfield.**—A Local Government Board inquiry was held last week concerning a loan of £7,000 for new plant and mains.

**Hindley.**—A Local Government Board inquiry has been held concerning a loan of £2,500 for putting into force an agreement for electric supply with the Lancashire Electric Power Co.

**Huddersfield.**—A Local Government Board inquiry was held last week concerning a loan of £60,000 for electrical extensions. It is proposed to put down a 4,000-kw. three-phase generating set and an additional 2,000-kw. single-phase set in two years' time.

**Keighley.**—In connection partly with the supply to Bingley, the following new plant is required:—800-kw. converting plant with switchgear, £2,500; two water-tube boilers, &c., £6,000; mains to Bingley, £2,000; additional mains for general purposes, £4,000.

**Littleborough.**—A loan of £4,000 for additional mains has been applied for.

**London: Battersea.**—A loan of £4,500 is to be taken up for electrical extensions.

**Lytham.**—Mr. J. H. Tonge, the Council's Consulting Engineer, has received instructions to proceed with the work of preparing plans, &c., for the electric supply scheme.

**Malvern.**—A new generating set is required.

**Manchester.**—Four 1,000-1,250-kw. converting sets, one 1,000-kw. set and two 650-800-kw. sets. Chief Electrical Engineer. December 19th.

**Warrington.**—A loan of £14,550 is to be applied for in connection with extensions to the electricity undertaking.

**West Ham.**—A Local Government Board inquiry was held last week concerning a loan of £21,500 for electrical extensions. There was some opposition.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Bath.**—An expenditure of £15,000 is to be spent on the general reconstruction of the Grand Pump Room Hotel.

**Belfast.**—Alterations to central and branch fire stations.

**Broadstairs.**—New school.

**Canterbury.**—Additions at Asylum. Architects, Jennings & Gray, 4 St. Margaret's Street.

**Folkestone.**—Enlargement of Hotel Metropole (£10,000). Gordon Hotels Co.

**London.**—New business premises on site of 134 New Bond Street. Architects, Inman & Son, Bedford Row, W.C.

**Manchester.**—Rebuilding of Rusholme Exhibition Hall after fire.

**Stafford.**—New music hall.

**Stoke-on-Trent.**—New police station at Fenton.

**Wallasey.**—New fire station (£5,000).

### Miscellaneous

**Australia.**—The Deputy Postmaster-General, Melbourne, requires coils, relays, lamps, &c., for telephone purposes. Further particulars, 73 Basinghall Street, E.C.

The Victorian Railway Commissioners require a 15-ton electric crane. Further particulars as above.

**Manchester.**—A supply of metal filament lamps is required by the Tramways Department. General Manager, December 16th.

**New Zealand.**—Tenders are invited by the Christchurch Council for cable, testing instruments, transformers, meters,

insulators, &c. Further particulars at 73 Basinghall Street, E.C.

**Sunderland.**—Twelve months' supply of electrical materials for the Guardians. Clerk, 17 John Street.

**York.**—A supply of arc-lamp carbons, incandescent lamps, meters, time switches, motors and general stores is required by the Electricity Department. Engineer and Manager, December 22nd.

**Yorkshire.**—Mr. Stephen Sellon, who is advising the Urban District Councils constituting the Dearn Valley Light Railway Board, estimates the cost of the proposed tramway scheme at £151,891, in addition to land and buildings.

## TENDERS RECEIVED AND ACCEPTED

**Caledonian Railway Co.**—The Edison & Swan United Electric Light Co. has secured an important contract for the supply of electric lamps to this Railway Co.

**Canadian Northern Railway Co.**—Siemens Bros. Dynamo Works, Ltd., has obtained a contract for the supply of marine traction type of Tantalum lamps for use on this Company's Atlantic steamship vessels.

**Chesterfield.**—The following tenders have been accepted:—Car bodies, Brush Electrical Engineering Co., £469 each; car electrical equipments, British Westinghouse Co., £282 each; electric track brakes, British Westinghouse Co., £55 each.

**Llandaff.**—The tender of the British Insulated & Helsby Cables, Ltd., for cables, has been accepted at £3,161.

**Manchester.**—The following tenders have been accepted:—Bruce Peebles & Co., 1,800-2,200-kw. converter; Ferranti, Ltd., twelve months' requirements of static transformers; W. T. Glover & Co., Liverpool Electric Cable Co., Charles Macintosh & Co., and Johnson & Phillips, cable.

**Melbourne.**—A contract for 33,300 lamps has been placed with Pope's Electric Lamp Co.

**Metropolitan Railway Co.**—A contract has been placed with Siemens Bros. Dynamo Works, Ltd., for a twelve months' supply of Tantalum and Wotan lamps.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the price of electrolytic copper, bars, c.i.f. port of arrival, quoted on Tuesday night, was £66 15s. to £67 5s. (last week, £68 to £68 10s.).

**Premier Electric and Hardware Co.**—We have received the following letter from Mr. J. MacConnell, Director of the Premier Electric & Hardware Co., Ltd. (9-10 Cheapside, Golders Green, N.W.):—

"My attention has been drawn to the publication in various trade journals of certain legal proceedings affecting a business entitled 'The Premier Electric & Hardware Co.' of Golders Green, and which may injuriously affect the Premier Electric & Hardware Co., Ltd., of which I am a director. This latter company purchased the goodwill and assets of the Premier Electric & Hardware Co., which was a private business trading under that title, but the limited company has no relationship whatever with that concern, but, on the contrary, is a limited liability company registered under the Companies Acts."

**Bankruptcies.**—The last day for receiving proofs in the bankruptcy of J. D. Dixon, Electrical Engineer, 65 Mill Street, Crewe, is December 18th. The trustee is Mr. F. T. Halcomb, King Street, Newcastle, Staffs.

**Agency.**—Krupka & Jacoby, Ltd. (26 to 36 Chapter Street, Westminster), have appointed Andrews & Co. (198A St. Vincent Street, Glasgow) as their agents in Scotland.

**Liquidations.**—Safety Light, Ltd., is to be wound up voluntarily. Mr. P. J. Goodchild, of 62 London Wall, E.C., is liquidator. A meeting of creditors is to be held to-day at Winchester House, Old Broad Street, E.C., at noon.

A meeting of creditors of the Prested Miners' Gas-Indicating Electric Lamp Co. will be held at 33 Carey Street, W.C., at 11.30 a.m. on December 17th.

**Half-watt Lamps.**—Messrs. Siemens Bros. Dynamo Works gave a demonstration at their lamp-works at Tyssen Street, Dalston, N.E., yesterday afternoon of a range of "Wotan" ½-watt lamps shortly to be placed on the market. We hope to publish an account of this in our next issue.

## LOCAL NOTES

**Bexley: Bulk Supply.**—The Woolwich Electricity Committee has informed the Council that no advantage will be gained by any further consideration at the present time of certain proposals which have been made with regard to bulk supply. If the Bexley Council is able to offer amended terms at any subsequent time, the Woolwich Council will be pleased to consider them.

**Dublin: Development of Electricity Undertaking.**—In giving a lecture before the Institution of Civil Engineers of Ireland last week on the City of Dublin electricity supply system, Mr. Mark Ruddle, the City Electrical Engineer, mentioned that, whereas in 1903 the public lighting was limited to 81 arc lamps in the centre of the city, this had now been extended to practically the whole of the city. The Electricity Committee had decided, he said, to allocate £500 annually towards street lighting extensions, and at present the first batch of 45 lamps are under test in some of the principal streets. There are now many hundreds of arc lamps in use for street lighting purposes in Dublin.

**Dundee: Supply Failure at Broughty Ferry.**—A spirited discussion took place at the last meeting of the Corporation in connection with Mr. Richardson's report upon the condition of the Broughty Ferry electricity undertaking, referred to on page 692 of our last issue. In defence of the late Manager of the Broughty Ferry undertaking, it was stated that Mr. Richardson, with several of the late Broughty Ferry Council officials, some time ago went over the works and agreed as to what extent repairs should be carried out pending the conversion of the power station to a sub-station in connection with the Dundee supply. A request by one of the Councillors for a Committee of Investigation was not acceded to, and eventually Mr. Richardson's report was adopted.

**Hove: Purchase of Company's Undertaking.**—According to the *Sussex Daily News*, pourparlers are now going on between the Corporation and a syndicate with a view to the latter working the electricity undertaking, which has just been acquired from the Hove & District Lighting Co. This line of action was foreshadowed on page 672 of our issue of November 27th.

**Liverpool: Electric Supply.**—Objection was taken at the last meeting of the Corporation to a proposal by the Electric Supply Committee to instal mains and machinery at an estimated cost of £2,000 mainly for the purpose of supplying a consumer, the revenue from whom would be £300 per annum. An amendment referring the proposal back was defeated by a large majority, it being explained that the agreement in question is for two years, and that the Electrical Engineer is satisfied that it is a good business proposition.

**London: Islington: Street Lighting.**—In accepting a tender of the Gas Light & Coke Co. for considerably increasing the candle-power in those streets already lighted by gas at a very much reduced price, the Lighting Committee report that they have inserted a provision that they may, should occasion rise, substitute electric lighting for gas lighting in any of the thoroughfares covered by this new contract should electric mains be laid there in the future. Judging by the Lighting Committee's report which was accepted at the Council meeting on Friday, it would seem that the Gas Co. has been acting under the stimulus of a proposal to prepare an electric lighting scheme for these particular streets.

**Woolwich: Switchboard Attendants' Hours.**—A proposal by the Electricity Committee to extend the forty-eight-hour week to all employees in the generating station who are now working a fifty-six-hour week has been adopted by the Council.

**Manchester: Trafford Supply.**—An agreement for the purchase of the Trafford Power & Light Supply (1902), Ltd., has been sealed, but is, of course, subject to Parliamentary sanction.

**Newcastle-on-Tyne: New Power Station.**—The Newcastle-on-Tyne Electric Supply Co. is extending its Dunston power station by the erection of another building on the other side of the river, and an agreement has been entered into for purchasing coke-oven gas from the Teams By-Product Co., Ltd., which is now installing a large battery of coke ovens on a site close by.

**Municipal Wiring and Fitting.**—The Electrical Section of the Local Chamber of Commerce has resolved to oppose the I.M.E.A. Bill on the wiring and fittings clauses when this comes before Parliament.

**Southampton: Electricity Undertaking.**—From a report

prepared by the Electricity Committee, it appears that considerable differences of opinion have manifested themselves between the Chairman of the Committee and the Borough Electrical Engineer, Mr. H. F. Street. The Chairman has presented to the Committee a lengthy report upon the financial aspect of the undertaking, and recommends that the  $\frac{1}{2}$ d. per unit taken off private lighting two years ago should be reinstated, and that the charge for heating and cooking should be increased to 1d. per unit. Mr. Street says he finds it necessary, reluctantly, to disagree with at least 90 per cent. of the Chairman's views, and is emphatic that neither the time nor the necessity for increasing the price of electricity for lighting purposes has arrived; indeed, it may never arrive. The Committee is not making any recommendation to the Corporation, inasmuch as the proposal of the Chairman was defeated by six votes to two, two members of the Committee not voting; but the matter is to be placed before the Corporation for it to take such action as it deems necessary.

**Swansea: New Plant.**—A new 1,200-kw. turbo-alternator was put into operation last week.

## APPOINTMENTS AND PERSONAL NOTES

Mr. G. Middlecoat, of the Southampton Corporation Electricity Works, is resigning his position with the Corporation and joining the staff of the Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex).

Mr. E. E. Eccles, Manager of the Foyers Works of the British Aluminium Co., has been appointed Assistant General Manager to the Company in London.

Mr. J. M. Robb, Assistant Electrical Engineer at Cheltenham, has been granted an increase in salary from £3 10s. to £3 15s. per week.

The Manchester Electricity Committee has appointed Mr. H. W. Smyth as Charge Engineer at the Stuart Street generating station, at a salary of £175 rising to £190 per annum.

Mr. G. R. Naylor, Electrical Engineer to the Nelson Corporation, has had his salary increased from £180 to £200 per annum. The salary of Mr. J. Stanworth, Mains Superintendent, has also been increased.

A first-class electrical engineer is wanted, with experience in installation and maintenance of power and lighting systems. (See advertisement on another page.)

The Swindon Corporation requires an electrical engineer to work under the Borough Electrical Engineer. Salary £120 rising to £180 per annum. Applications to Town Clerk by the 27th inst.

An improver wanted at the Swindon Electricity Works. (See advertisement on another page.)

Switchboard attendant required by the Stepney Electricity Department. Salary, 25s. per week. (See an advertisement on another page.)

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &amp;c.

**India Rubber, Gutta Percha & Telegraph Works Co.**—There was a net profit of £55,551 for the year ending September 30th, to which is added £5,904 brought forward from the previous account. A final dividend, making  $7\frac{1}{2}$  per cent. for the year, is recommended on the ordinary shares. The report states that there has been a considerable falling off in the amount of submarine cable manufactured, although the Company's steamers have been well employed. We regret that Mr. R. Kaye Gray has been obliged, through ill-health, to resign his position as Managing Director. Messrs. C. H. Gray and W. E. Gray have been appointed Managing Directors to succeed him. Mr. R. Kaye Gray has been appointed Extraordinary Director.

## SUMMARY

A NATIONAL Illumination Committee of Great Britain has been established in connection with the International Illumination Commission. (Page 717.)

Two types of relay are being used by the British and German telephone departments in connection with the speaking tests between London and Cologne and Berlin. One of the relays is the latest form of Mr. S. G. Brown's invention, which is on the microphone principle, and the other is the Lieben-Reisz lamp relay, in which the telephone currents are strengthened in their passage through a glass tube containing mercury vapour by the action of a Wehnelt cathode. (Page 713.)

A PAPER by Mr. H. C. Gunton, read before the Manchester Local Section of the Institution of Electrical Engineers on Tuesday, and to be discussed at the London meeting to-night, describes the various uses of electric power in the Post Office. (Page 714.)

THE County of London Electric Supply Co. is promoting an important Bill with a view to modifying the purchase powers of the London County Council, and enabling agreements to be entered into between the various London companies for the reorganisation and consolidation of London's electric supply. (Page 715.)

SPLENDID work has been rendered by volunteers in the Leeds electricity works during the strike. On Friday, in spite of the strike, the works carried its record load. (Page 715.)

THERE were interesting displays of instruments at the Physical Society's Exhibition on Tuesday. These included some new designs for electric vehicles, and

some of the moving coil pattern of pocket size. (Page 715.)

THE sizes of motors required for driving saw-mills are discussed in our "Questions and Answers" columns. (Page 716.)

A LETTER from the author of a book reviewed in ELECTRICAL ENGINEERING last week makes clear for what class of reader the book is intended. (Page 717.)

THE Electrical Trades Union has refused to negotiate with the London Electrical Masters' Association on the terms laid down by the latter. We publish a letter from the Union repudiating certain statements made by Mr. Duncan Watson in the interview published in our last issue. (Page 717.)

APPLICATION is being made to amend a patent relating to A.C. track circuit signalling by J. B. Struble, and a patent relating to enclosed flame arc lamps by A. Blondel. A Marconi patent for aerial receiving circuits, and a Muirhead patent for details of the construction of automatic telegraph transmitter perforators expire during the next few days after a full life. A specification by A. C. Michie and R. A. S. Paget relating to the embedding of heating wires in refractory material was published by the Patent Office last week, as was one relating to unidirectional H.P. discharges by Sir. O. J. Lodge and L. Lodge. (Page 718.)

A CONFERENCE of Metropolitan tramway authorities is to discuss the House of Commons Traffic Committee's recommendations.—It is rumoured that the finances of the Underground Electric Railways Co. and its allied companies are to be rearranged. (Page 719.)

THE payments to the Turkish Government in respect of the Constantinople telephone system will be 15 per cent. of the receipts plus 14s. per mile of line.—The Egyptian Government is negotiating for the purchase of the business of the Telephone Co. of Egypt.—Mr. J. St. V. Pletts dealt with directive aerials and wave meters in a lecture on wireless telegraphy last week. Without the directive aerial duplex working would not be possible. (Page 719.)

An illustrated article describes some new forms of recording instruments. (Page 720.)

An improved pattern of quartz heater and a capstan controller are described, and a process for coating metals with lead is referred to on page 721.

SOME particulars of the "Wotan" half-watt lamps, and the sizes in which they will be placed on the market are given on page 721.

A PATTERN of earthed wall plug for use in private houses is described, and a fittings showroom and a large electric sign are illustrated on page 722.

MAINS are required at Wolverhampton and Monmouth; electric lighting plant at Kirkby Stephen, Ashton-under-Lyne, Holmfirth, Portsmouth and Devonport.—Meters are required at Lowestoft;

traction motors, &c., at Bradford; a street lighting scheme is to be put into effect at Swinton. (Page 723.)

THE Southampton Corporation has taken no action in the dispute between the Borough Electrical Engineer and the Electricity Committee's Chairman.—The Teignmouth Council has abandoned the idea of a municipal lighting scheme.—The new Association of Electric Station Engineers is to discuss working conditions with the Dewsbury Electricity Committee. (Page 724.)

A NEW issue of capital is being made by the Tramways, Light and Power Co. (Page 724.)

### ARRANGEMENTS FOR THE WEEK

(TO-DAY) THURSDAY, DECEMBER 18TH.

*Institution of Electrical Engineers.*

8 p.m. "The Employment of Power in H.M. Post Office," by H. C. Gunton.

FRIDAY, DECEMBER 19TH.

### The London Electrical Engineers.

(TO-DAY) THURSDAY, DECEMBER 18TH.—C. Company. Technical Instruction 7 to 10 p.m.

FRIDAY, DECEMBER 19TH.—D. Company. Special Class on Crossley Engine 7 p.m. Technical Instruction, 7.30 to 9.30 p.m.

SATURDAY, DECEMBER 20TH.—Headquarters open from 10 a.m. till noon.

MONDAY, DECEMBER 22ND, TO SATURDAY, DECEMBER 27.—Headquarters open for Regimental business only.

MONDAY, JANUARY 5TH.—A. Company. Technical Instruction, 7 to 10 p.m.

TUESDAY, JANUARY 6TH.—B. Company. Technical Instruction, 7 to 10 p.m.

WEDNESDAY, JANUARY 7TH.—Recruits only. Infantry Drill and Technical Instruction, 7 to 10 p.m.

THURSDAY, JANUARY 8TH.—C. Company. Technical Instruction, 7 to 10 p.m.

FRIDAY, JANUARY 9TH.—D. Company. Technical Instruction, 7.30 to 9.30 p.m.

Special Class on Crossley Engine, 7 to 8 p.m.

SATURDAY, JANUARY 10TH.—Headquarters open from 10 a.m. till noon.

**Meter Approved.**—The Board of Trade has approved of the Electrical Company's single-phase meter, type LJC, and also the means for fixing same.

### NATIONAL ILLUMINATION COMMITTEE OF GREAT BRITAIN

A PROVISIONAL COMMITTEE, formed of representatives of the Illuminating Engineering Society, the Institution of Electrical Engineers, the Institution of Gas Engineers, and the National Physical Laboratory, held a meeting on November 29th last, at which arrangements were made for the formation of a National Illumination Committee to be constituted according to the Statutes of the International Illumination Commission, with the primary object of affiliating Great Britain to that Commission. The Provisional Committee recommended that the National Committee should consist of five representatives of each of the three technical societies, and two representatives of the National Physical Laboratory. This recommendation has been adopted, and the following have been nominated as members of the Committee:—By the Illuminating Engineering Society, Mr. Leon Gaster, Mr. F. W. Goodenough, Professor Silvanus P. Thompson, and Mr. A. P. Trotter (this Society has not yet nominated its fifth representative); by the Institution of Electrical Engineers, Mr. F. Bailey, Mr. W. Duddell, Mr. K. Edgumbe, Mr. Haydn Harrison, and Professor J. T. Morris; by the Institution of Gas Engineers, Mr. E. Allen, Mr. J. Bond, Mr. W. J. A. Butterfield, Dr. H. G. Colman, and Mr. H. Watson; and by the National Physical Laboratory, Dr. R. T. Glazebrook and Mr. C. C. Paterson. The first meeting of this National Committee took place on the 2nd inst., when the following were chosen as officers:—Chairman, Mr. E. Allen (Liverpool); Vice-Chairmen, Mr. W. Duddell and Mr. A. P. Trotter; and Hon. Sec. and Treasurer, Mr. W. J. A. Butterfield, of London. Great Britain is entitled to two delegates on the Executive Committee of the International Illumination Commission, and Dr. H. G. Colman and Mr. W. Duddell were accordingly appointed by the Committee as the delegates from this country.

**London Electricity Supply.**—The L.C.C. has issued its usual annual statement giving complete statistics of London electricity supply, both as regards companies and local authorities. These relate to the year 1911-12, but the figures may have some significance in connection with the general statement of the position of electric supply undertakings in London, which is given in the Return, having in view the promotion of the County of London Electric Supply Co.'s Bill next session.

TO TEST THE WIND. Will it "raise the wind" also?

## EXPERIMENTS WITH TELEPHONE RELAYS ON LONG INTERNATIONAL LINES

THE British and German telephone departments have been engaged in some extremely useful experiments with telephone relays, and trials have been made between London and Cologne through the Anglo-Belgian submarine cable, and incidentally also between London and Berlin. The line from London to Brussels through the cable is telephonically equivalent to twenty-two miles of "standard cable," through which, of course, telephony is quite satisfactory. Extending the line to Cologne, however, increases the length to an equivalent of thirty miles of standard cable; London to Berlin is equivalent to a further twenty miles of standard cable. It was found that by inserting a telephone relay at Brussels, the speech between London and Cologne was equal to that through only twenty miles of standard cable, and that therefore even between London and Berlin speech could then be heard. The chief experiments were between London and Cologne, however, and we believe that they are being continued.

Two types of relay were employed. The first one is the Brown relay—a later form of the ingenious telephone relay described by Mr. S. G. Brown before the Institution of Electrical Engineers two-and-a-half years ago (*ELECTRICAL ENGINEERING*, Vol. VI., May 12th, 1910, p. 305).

In this newer type, known as the "G" pattern, the secondary contact is a microphone chamber containing carbon granules instead of the minute "conduction space" between a platinum

FIG. 1.—GENERAL VIEW OF S. G. BROWN'S RELAY.

point and disc used in his earliest pattern, and subsequently replaced by an iridium point and hard carbon plate in his relays for wireless telegraphy. A general view of the instrument is seen in Fig. 1, and an elevation in Fig. 2. In the latter *N* is a permanent magnet, on the pole-pieces *H* of which are wound two coils carrying the current received from the line. A steel reed *P* can be adjusted by the screw *W*, and has the front of the microphone chamber *M* fixed to its upper end which faces the pole-pieces of the permanent magnet, making an almost complete magnetic circuit with a very small air gap. The microphone chamber contains two carbon-faced electrodes, and is nearly filled with fine carbon granules. The tension of the reed is adjusted by the screw *W* until the reed is on the point of dropping against the pole-pieces, so that its elasticity is nearly balanced by the magnet pull. *S* is a stop screw to prevent the reed from falling against the magnet faces. *K* is a regulating winding in series with the microphone; it prevents any considerable drop in the steady current when the relay is strongly operated, and also, by its telephonic action, intensifies the magnifying power of the instrument.

The relay is used with a condenser in series on the primary side; and the circuit of the secondary side is made up by a battery, the primary of an induction coil, and the microphone chamber.

We are informed by Mr. Brown that the relay will magnify the current about 20 times, and that its use corresponds to a saving equivalent to the loss in 30 miles of standard cable.

If used in the middle of an ordinary simplex line, a relay has, of course, the disadvantage that it can only work in one direction, and in early experiments the line has been duplexed. There is, however, difficulty of maintaining good balance on a duplexed

telephone line, owing to variations in insulation resistance, and varying terminal conditions, and duplexing, of course, also halves the transmitted and received currents. Mr. Brown therefore now uses a highly sensitive simplex automatic switch to reverse

FIG. 2.—ELEVATION OF S. G. BROWN'S TELEPHONE RELAY.

the relay connections according to the direction of the received speaking currents.

The second relay experimented with by the two postal administrations is the Lieben-Reisz relay, which acts on an entirely different principle.

The amplification of the waves of the telephonic current is in this case effected by passing the received current between two electrodes in a tube of mercury vapour, and by passing a high-voltage current between the lower of these electrodes and an auxiliary one above both. This current has variations corresponding to those of the telephone currents impressed upon it. The construction of the relay is shown in Fig. 3 and the general connections in Fig. 4. An increase in the magnitude of the impressed waves of about 30 times can be obtained, and by connecting two or more relays in cascade series, as shown in Fig. 4, the effects are multiplied. The glass vessel *G* is exhausted to a value of 0.001 mm. of mercury, and the anode *A* has a large surface, as it consists of a specially wound aluminium wire 2 mm. in diameter, and *H* is the auxiliary electrode. The latter is made of aluminium, and has a number of uniformly spaced openings  $3\frac{1}{2}$  mm. in diameter. For the cathode, *K*, a glowing oxide cathode of Wehnelt pattern is employed, which here consists of a platinum wire wound in zig-zag fashion on a glass bearer, and overlaid with a thin layer of barium and calcium oxide. This is brought to a bright red heat of approximately 1,000° C. by a current of 1.8 amperes from a 30-volt battery. In order not to diminish further the discharging potential, which is reduced appreciably through the employment of the Wehnelt cathode, the space in the glass vessel is filled with mercury vapour at approximately 0.001 mm. pressure (the vapour pressure of mercury at 20° C.).

In order that the circuit of the current to be strengthened has the necessary auxiliary potential impressed upon it from the electrode *H*, the heating battery is connected to a high resistance potentiometer. The coil carrying the current to be strengthened is connected, either directly or through a transformer, in the conductor leading from the sliding contact to *H*. As a source of energy for the principal current circuit, D.C. mains or a small battery of 200 to 250 volts are most suitable. In order to choke

FIG. 3.—LIEBEN-REISZ RELAY.

FIG. 4.—CASCADE CONNECTION OF LIEBEN-REISZ RELAYS.

the current fluctuations caused by the commutator of the machine, if the D.C. mains are used an impedance coil of about 3 henrys is connected in series with one pole and a condenser of 10 mfd. between the poles. The circuit connections are shown in Fig. 5. The transformer *T*<sub>1</sub> is not necessary in theory, but it is used in practice to keep the 250-volt circuit from the con-

nected apparatus. For the strengthened alternating currents the impedance is reduced by a 2 mfd. condenser.

With the right arrangement of the auxiliary potential the bluish-green glows in the two parts of the lamp divided by the auxiliary electrode are equally bright, and the cathode dark space on the upper half of the perforated electrode measures about 4 mm. Adjustment of the auxiliary potential is provided for, and when correct the glow in the upper half of the lamp should be extinguished. The temperature of the Wehnelt cathode can also be adjusted by the resistance  $R$  (Fig. 5). If the temperature is too low, the current in the gas, which normally should be 0.02 ampere, is not sufficient, and if too high the lamp burns unsteadily, thus necessitating a continuous regulation of the auxiliary potential. If this and the cathode temperature are adjusted correctly, the lamp will burn steadily for several hours. The relay should only be placed in rooms where

FIG. 5.—CONNECTION FOR DUPLEX WORKING THROUGH A SINGLE RELAY.

the temperature is not above 35° C., as temperatures above this will raise the pressure of the mercury vapour so much that the negative potential of the auxiliary electrode does not suffice to keep down the flow of ions through the openings of the lattice, the cathode dark space, and consequently the resistance of the gas diminish and the working of the relay is prevented.

In Fig. 5 is shown a connection for duplex working. The relays are placed in the middle of the loop joining the two distant points. By using transformers of suitable design it is possible to connect lines of unequal length and of varying characteristics.  $F_1$  and  $F_2$  are the lines connecting the two subscribers.

## ELECTRIC POWER IN THE POST OFFICE

A PAPER on "The Employment of Power in H.M. Post Office," by Mr. H. C. Gunton, was read on Tuesday evening before the Manchester Local Section of the Institution of Electrical Engineers, and will also form the subject of to-night's discussion at the London meeting of the Institution.

The author outlined the main power supply system from the Post Office generating station at Blackfriars (see *ELECTRICAL ENGINEERING*, Vol. VI., p. 724, November 17th, 1910), and the three substations at King Edward Building (Vol. VI., p. 745, November 24th, 1910), G.P.O. West, and Carter Lane, mentioning how a battery at G.P.O. West could maintain the whole supply by running the converters reversed. The present load is small, but its favourable character renders it possible to supply energy at 1½d. per unit. In the provinces the tendency is to replace isolated generating plants by municipal supply, in some cases with batteries in the substations.

The author then passed on to detail some developments in pneumatic tube work and lifts. Of the latter there are many varieties which are electrically driven, and comparing electric and hydraulic lifts the author writes: "The capital cost of an electric lift is usually greater than that of an hydraulic lift, except in the case of a very long travel. The average maintenance cost of an electric lift is not likely to be so great as that of an hydraulic lift, but for all practical purposes they are taken to be about the same. The greater the number of stops and the shorter the travel between floors, the less favourable is the case for the electric lift as regards the cost of operation."

Other applications of electrical power referred to are the driving of conveyors in sorting offices and telegraph instrument rooms, stamping and obliterating machines, bag cleaning machines, &c. Electric fans are largely used for ventilation, designed usually to change the air of the various floors at a rate varying from a minimum as produced by unaided ventilation to a maximum forced circulation of 2.5 to 3 changes of air per hour. Considerable difficulty has been experienced with the ventilation of telephone exchange switchrooms, owing to the high switchboards interfering with the natural circulation of the air. Most satisfactory results have, however, been obtained by installing suspended fans of the revolving type between the switchboards to circulate the air, in addition to fans in the windows for the extraction of air.

An interesting point in connection with telephone exchange power plant is the necessity for generators specially designed

to give silent working when supplying the telephone-exchange circuits direct without any battery in circuit. Their chief features are ring-wound armatures with a large number of commutator segments, uniform distribution of the field, good balancing both mechanically and electrically, good commutator surface and a special type of high-conductivity brushes; large choke coils of special design are also used in conjunction with the machines. The machines are built in sizes from 1 to 40 kilowatts.

The Paper then dealt with electric lighting of Post Office premises, and it was mentioned incidentally that about 4,300 kw. was absorbed for the purpose, and that a saving of £8,000 per annum had resulted from the introduction of metal filament lamps.

The next subject taken up was the projected Post Office Tube Railway (see *ELECTRICAL ENGINEERING*, August 14th, p. 471).

It is proposed to operate the trains by three types of current: high speed (H.S.), intermediate speed (I.S.), and low speed (L.S.). Between the stations H.S. current will be applied. At the approach to a station the wagons will pass over a short gap in the conductor rails, and brakes (which will be electrically released when the train is taking current and applied when the train is not taking current) will be applied. The next section of conductor rail will normally be "dead," and will be of such a length as to allow the wagon to come to rest, the brake remaining on. In the case of a wagon which is required to stop at the station, a L.S. current will be applied to this brake section and the train will move to the station platform, and will finally be brought to rest owing to the application of the brakes when it reaches its sub-section of the station platform, the conductor rails of that sub-section having been made "dead" for its reception. In the case of a through train, I.S. current would be applied to the brake section, and the wagon would run at this speed through the station, would pass over a short gap in the conductor rails, and then without a stop on to the sections of the track energised by H.S. current. In the event of its being possible to accept, without delay, either a stopping train or a through train, the braking section, or a certain portion thereof, would be energised with I.S. or L.S. current respectively before the train reached that section, in which case the train would merely be retarded down to the speed corresponding to the current applied, and would either pass up to the platform or straight through the station. A wagon will be dispatched from the station by making alive the conductor rails of the sub-section on which it has been standing with I.S. current, if it is being sent on to a main line, or with L.S. current for shunting operations.

The control of the wagons will not need the continuous attention of the switchman, who, by means of small levers in the cabin, will set points for the particular route desired, and will energise certain sections of the conductor rails with the appropriate current. The wagon will then come to rest at the proper section of the platform, or will run through the station without further attention. The operation of the points will be interlocked with the application of the current, and there will be a complete interlocking arrangement between the different routes.

In conclusion, reference was made to the Edison battery trucks described in *ELECTRICAL ENGINEERING* (November 6th, p. 618), which are being experimented with.

**The German Society of Illuminating Engineers.**—The first meeting of the "Deutsche Beleuchtungstechnische Gesellschaft" was held in Charlottenburg on November 8th last, and the official record of the proceedings is published in the *Elektrotechnische Zeitschrift* of December 11th. Herr Schanz again expressed alarmist views as to the possible ill-effects of ultra-violet rays from metal filament lamps but his fears were effectively disposed of by numerous authorities in the discussion. A useful Paper on the determination of the colour of light was read by Professor Bloch.

**The Electrical Trades Benevolent Institution.**—The report of the committee and accounts for the year 1912, together with the report of the last annual general meeting, the festival dinner, the list of subscribers, &c., and the rules, has just been issued in booklet form. In 1912 the income was not quite so large as in the previous year, due to the fact that the Institution was, in the year 1911, the recipient of a legacy and also of the balance of the amount from the 1905 Olympia Exhibition. In the course of the year 1912 only one corresponding donation was received, viz., that from the British Electrical and Allied Manufacturers' Association of £250. The total income for the year 1912 is £954 10s. 9d., as compared with £1,107 15s. 10d. for the year 1911. There has, however, been a very marked improvement in the number of persons subscribing as well as in the amount of subscriptions, which is now more than four times that of last year, while the ordinary donations are considerably more. The result of this year's work has been a net income of £754 5s. During the year under review, eight grants were paid out, amounting to £71 3s. 6d., and £200 5s. was accounted for as salaries, fees, and expenses. The Institution has prepared printed forms of codicil to facilitate making bequests.

## LONDON ELECTRIC SUPPLY

THERE has been a good deal talked and written during the past week as to the great scheme for the reorganisation of the electric supply of London foreshadowed by the Bill which has just been deposited in Parliament on behalf of the County of London Electric Supply Co. and others, and a few of the daily papers have indulged in somewhat imaginative flights of speculation. The matter has already been referred to in *ELECTRICAL ENGINEERING* (Nov. 27th, p. 672), but it may be of interest to indicate a little more precisely the stage to which the scheme has been brought. As has been remarked before, the main object of the Bill is to render possible a postponement of the date, at present fixed at 1931, when the present London companies' undertakings can be purchased by the London County Council, to modify the nature of the terms upon which such purchase can be made, and to give the companies concerned power to enter into agreements with each other and with the London County Council to effect a reorganisation and consolidation of London's electric supply. The scheme is really in a much more preliminary stage than one would suppose from some statements which have appeared in the Press. The County of London Co., it must be understood, is seeking not so much to effect an amalgamation of the existing London supply companies into one concern, as to bring about a consolidation of their supply. It is not intended that the present companies should lose their individualities, but it is hoped that the advantages and economies of bulk supply on a large scale may be made available by the conversion of some of the smaller existing stations into sub-stations, while the main supply is given by one or more new large power-houses, and the extension of some of the larger existing ones. To facilitate such a scheme the County of London Co. is taking the first step in promoting this Bill. The other companies have had the matter under consideration for some time, but have not yet actually come into agreement; in fact, the matter is still to a large extent in the melting pot. The Bill, however, is drafted with the object of enabling the necessary agreements to be completed between the parties, without further Parliamentary sanction being necessary. The County Council, a special Committee of which has had the question of the electric supply of London under consideration for some two years, and has now the expert assistance of Mr. Merz, is opposing the Bill, but the promoting Company anticipates that this is mainly with a view to obtaining a *locus standi*, and is sanguine—perhaps too sanguine—that agreement will ultimately be arrived at between the Council and the companies. It is premature to say much as to the engineering details of the scheme, but, as we pointed out a week or two ago, it is significant that during last session the County of London Co. obtained an option for a site of 23 acres close to Barking which might be used for the purpose of a large new generating station. That the scheme is a large one is obvious from the fact that about thirteen companies, with an aggregate capital of over fourteen millions, would probably be involved. Considerable new capital will, of course, also be required for the rearrangement of the systems, and the building of new stations.

The main clause of the Bill states that it is for the purpose of facilitating the making or carrying into effect of any "association agreement" between any two or more of the London electric supply companies (notwithstanding anything contained in the London Electric Supply Act of 1908 as amended or extended by the London Electric Supply Act, 1910, . . . or any other Act of any of the London electric supply companies). It provides that the London County Council and the companies may at any time within three years from the passing of this Act enter into any agreement for the postponement, whether conditional or otherwise, of the date at which the Council may purchase the companies' undertakings or any parts of them, and for the variation of the terms and conditions upon which the purchase is effected.

The preamble of the Bill states that it is one "To benefit the consumers of electrical energy within the County of London, and materially improve the position of the Council as the purchaser of the undertaking of the said Company." The contention of the Company is that if agreements can be come to for the Company or companies to unify conditions of electric supply in London prior to 1931, then, in the event of the Council purchasing at that date, they will purchase under very much improved conditions than will be the case if the present position is maintained until 1931, and the work of unification put in hand then. On the other hand, of course, the terms of the Bill would provide for any agreements that might conceivably be entered into, under which the companies would continue to work the unified system after 1931.

## THE LEEDS STRIKE

THERE are distinct indications that the strike of the municipal workers at Leeds will quickly end, a result largely due to the few loyal workers who remained at their posts, and the spirited action of a large number of members of the public who have gone to their assistance. The strike commenced on Wednesday last week, and during the next few days extended in smaller or larger degree to practically all departments, and it has been computed that there were 5,000 men on strike.

That the action of the public has been largely responsible for foiling the leaders of the strike is well shown by what has taken place at the electricity works, which is being run by a nucleus of engineers and loyal workmen, admirably assisted by a large voluntary staff drawn from the citizen's ranks. The engine-drivers and stokers, after giving seven days' notice, left work at the expiration of the night shift on the day following the notice, but the supply of electricity has been maintained without the slightest falling off in pressure, and without asking the public to restrict their consumption. Indeed, the station on Friday carried its record load of 13,500 kw., compared with last year's maximum of 10,700 kw. The management is convinced that the works could, if necessary, be kept going permanently under the existing arrangements, as there is a large reserve list of volunteers anxious to come in and help as soon as there is room for them.

A somewhat similar condition of affairs has obtained in the tramway department, which has been able to maintain a very useful service of cars, and it is the work of these two departments which has had more than anything else to do with the present tendency of the strike to break up.

## THE PHYSICAL SOCIETY'S EXHIBITION

THE ninth annual exhibition of electrical, optical and other physical apparatus, promoted by the Physical Society of London, was held on Tuesday at the Imperial College of Science. Interesting displays were made by different firms, and the experimental demonstrations proved a great attraction. These demonstrations included one by Prof. J. T. Morris and Mr. J. F. Forrest on the electric arc as a standard of light, and one by Prof. J. A. Fleming, F.R.S., of a method of producing vibrations on loaded and unloaded strings. By imparting the waves to the string through a rotary crank driven by an electric motor, the phenomena of stationary waves, &c., under different conditions were illustrated. About twenty firms were showing electrical instruments, including a bold show by the Weston Electrical Instrument Co. On this stand the Weston synchroscope proved a source of attraction, while the miniature precision direct-current ammeters and voltmeters exhibited remarkable sensitiveness and dead-beatness. These neat little moving-coil instruments are designed for a variety of purposes, and are so small that they may be put in the pocket, while the internal construction is quite up to the Weston Co.'s usual high standard. The voltmeters read up to 150 volts without the use of resistances, and the ammeters up to 30 amperes without the use of shunts. Another new type of instrument shown was a combined illuminated dial ammeter and voltmeter with specially made movements for use on electric vehicles. Although new to this country, this instrument, we were informed, has been in extensive use in America for some time past. A large display of miscellaneous instruments for all purposes was made by R. W. Paul, while the Record Electrical Co., Ltd., showed examples of the well-known "cir-scale" ammeters and voltmeters. In these 300° of scale is traversed by the pointer. Evershed & Vignoles, Ltd., showed the "Megger" and "Ducter," and Nalder Bros. & Thompson had on view the latest type of "Ohmer" with vibrating reeds, as well as a circuit-breaker allowing of fine adjustment on both A.C. and D.C. circuits, and examples of dynamometer-type instruments. Gambrell Bros., Ltd., showed for the first time a moving-coil galvanometer, with pointer or mirror, which requires no levelling. It proved to be very sensitive as well as robust. The movement is suspended below the coil, so that it always remains central, and a very small gap is allowable. A 2,000 mm. deflection per micro-ampere with lamp and scale at one meter is obtained. In addition, exhibits were made by Isenthal & Co., Ltd.; Elliott Bros.; Foster Instrument Co.; Crompton & Co., Ltd.; Cambridge Scientific Instrument Co., Ltd., who showed the electrostatic oscillograph devised and perfected by Prof. H. Ho and Prof. S. Kotô (*ELECTRICAL ENGINEERING*, Nov. 20th, p. 644); Synchronon Co., Ltd.; J. J. Griffin & Sons, Ltd., who showed, among other things, an aluminium hot-plate with automatic temperature regulation; A. C. Cossor, Ltd., and others.

Wireless apparatus was especially represented by Marconi's Wireless Telegraph Co., Ltd., Ludgate Wireless Co., and Muirhead & Co., Ltd., who showed the ingenious Heurtley magnifier and two sets of Colonel Squier's "Wired-wireless" field apparatus (see *ELECTRICAL ENGINEERING*, Vol. VIII., p. 302, June 6th, 1912). Another exhibit which attracted much attention was that of Duram, Ltd., which showed the various stages of tungsten wire from the ore to the final lamp filament, as carried out by this Company in this country.

## QUESTIONS AND ANSWERS BY PRACTICAL MEN

### RULES.

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

### QUESTION No. 1,370.

In modern turbo-generators of large capacity, what is the usual percentage of reactance? What are the advantages and disadvantages of high reactance?—A. S. T. I.

(Replies must be received not later than first post, Monday, December 29th.)

### ANSWERS TO No. 1,368.

I am putting in motor drives in a sawmill, and should be glad of an idea of the sizes of motors required. One is to drive countershafting with five circular saws on (all push benches without power feed), one 48-in. saw, three 36-in. saws, and one 40-in. saw; and the other to drive two horizontal frame saws and friction hauling gear. The motors will be for continuous current and are to run at about 800 r.p.m.—F. H. G.

The first award (10s.) is given to "A.G.R." for the following reply:—

In reply to "F. H. G.'s" inquiry, I should like to point out that the power taken by the various machines will vary between very wide limits, according to the class of wood to be cut, and that as he does not state the conditions, only average figures can be given. To quote a few examples of actual machines will give "F. H. G." an idea of the variation in power taken in cutting different woods:—

(a) A circular saw of 36-in. diam. cutting yellow pine 11 in. deep at 20 ft. per min. took 2.9 h.p. running light, and 18 h.p. with load on. These figures do not include the power taken by the shafting and motor which was about 3.8 h.p.

(b) Saw-mill circular saw (to take 60 in. diam. saw) driven by a 30-h.p. 600-r.p.m. shunt wound motor through a belt. Speed of saw 750 r.p.m., cutting damp pitch pine from 10 in. to 17 in. thick (average 14 in.). Power taken: Max. 36 h.p., min. 21 h.p., mean 26 h.p.

(c) Circular saw 33 in. diam. cutting cross-cut Lignum Vitæ 9½ in. deep by 18 in. long took 2.3 h.p. running light, and 7 h.p. with the load on. The figures do not include power lost in shafting, &c., which amounted to approximately 3.7 h.p.

(d) Circular saw 32 in. diam. cutting yellow pine 11 in. deep at 7 ft. per minute, took 1.4 h.p. running light, a maximum of 9.5 h.p. and a mean of 6.9 h.p. with load on, exclusive of power lost in motor and shafting, &c., which was 3.6 h.p.

Referring now to the case under consideration, the following table shows approximately the average power which will be taken by the various machines (exclusive of power lost in shafting):—

Machine.	H.P. running light.	H.P. with load on.
36-in. circular saw	2.4	16.0
40-in. "	3.0	20.0
48-in. "	4.3	28.0

The total h.p. will therefore be:—

For 1-48-in. circular saw ...	28 h.p.
" 3-36 in. " ...	48 h.p.
" 1-40-in. " ...	20 h.p.
	96 h.p.
Allow for h.p. lost in shafting ...	20 h.p.
Total ...	116 h.p.

Allowing that the machines will not be working at a maximum rate at the same time, a 100 h.p. 800 r.p.m. shunt-wound motor could be used. The efficiency of such a motor would be about 92 per cent., so that the power taken from the supply mains would be 81 kw. With reference to the second part of the question, a figure for the power taken by the friction hauling gear can hardly be given with any accuracy without knowing the actual conditions of operation, &c. The power required for a horizontal frame saw of average size would be about 4 to 5 h.p., exclusive of the power required for the shafting.

The second award (5s.) is made to "W. H.," who writes as follows:—

There is scarcely sufficient information in the question to give a really accurate estimate as to the power required by the various saws, as no details are given as to the type of saw, whether "cross cut" or "swage," nor is there anything to state the kind of wood to be worked. We will assume that ordinary cross-cut saws are to be installed, and that ordinary soft woods are to be worked. The powers required by the various saws would be as follows:—

A 48-in. cross-cut saw requires 13 b.h.p.  
3-36-in. cross-cut saws require 30 b.h.p.  
1-40-in. cross-cut saws require 11 b.h.p.

Thus making a total b.h.p. of 54.

It will probably be correct to state that there will never be more than four saws working simultaneously; thus if we install a 40-45 b.h.p. motor running at a speed of 800 r.p.m., and driving on to the countershaft by means of belting, this should give all the required power. The most suitable type of motor would be a shunt-wound machine fitted if necessary with commutating poles. It should be noted that for driving saws singly, a slightly compounded motor should be used, in order to obtain some flywheel effect, but in the case of group drive this is hardly necessary. The motor should be of the "drip proof" or "pipe ventilated type," with dustproof bearings. This class of motor is much cheaper than a totally enclosed machine would be.

With regard to the other motor required for driving two horizontal frame saws, and also for supplying power to a friction haulage gear, no details are given as to the purpose of the haulage gear, so we will assume that 5 h.p. would be required for this purpose. This will, of course, be a very intermittent load, and might well be taken care of by the overload capacity of the motor. The two frame saws will require from 20 to 25 h.p. each, thus making a 40-50-h.p. motor suitable for the purpose. If, therefore, we install a 50-b.h.p. motor running at 800-r.p.m., this will be sufficient to take care of the 5 h.p. required for the haulage gear. This motor would also be of the "drip proof" or "pipe ventilated" type, with dustproof bearings. In case any unusual woods are to be worked, the following figures should be of interest. Ordinary hard woods would require about 20 per cent. more power than those stated above, and extremely hard woods would require from 60 per cent. to 100 per cent. more power. Swage saws would require about 2½ times as much power as the cross-cut saws mentioned above.

**Power Supply across the Sea.**—While the supply of power to Copenhagen from Trollhätten, Sweden, is still under discussion, a second and similar scheme for the supply of power across the Skagerrak has been mooted. According to the *Elektrotechnische Zeitschrift*, the scheme involves the development of a water-power near Christiania, Norway, and transmission by submarine cables across the Skagerrak to the northern district of Jütland, Denmark.

**Annual Dinner of the Scottish Local Section of the I.E.E.**—The principal guest of the annual dinner of the Scottish Local Section of the Institution of Electrical Engineers on Thursday last was Lord Rosebery. Mr. J. A. Robertson, Chairman of the Section, presided, supported by Mr. James Lowson, Vice-Chairman, and Mr. W. P. McWhirter, Past-Chairman, and a number of other notable men were present. Mr. A. Bruce Anderson proposed the Imperial Forces, and in replying Commander Acklom referred to the many uses of electricity in the Navy, and Sir George Beatson replied for the Army. Sir J. Ure Primrose proposed the Houses of Parliament, and the speech of the evening was the reply of Lord Rosebery, who proposed an amusing scheme for voting electrically at Parliamentary divisions, and touched on a number of general subjects, regretting the ruinous competition in national expenditure and the gradual invasion of personal liberty by present-day legislation. Mr. D. T. Holmes replied for the House of Commons, and the toast of the City of Glasgow was proposed by Dr. S. Z. de Ferranti, and responded to by Lord Provost Stevenson. The toast of the Institution was proposed by Bishop Campbell, and replied to by Mr. W. Duddell, F.R.S., and the final toast was "The Scottish Local Section," proposed by Mr. J. E. Kingsbury, and replied to by the Chairman. During the evening a presentation of a gold watch was made to Mr. J. E. Sayers, with a diamond pin for Mrs. Sayers, on the occasion of the retirement of Mr. Sayers from the Secretaryship of the Section.

## THREATENED STRIKE OF ELECTRICAL WORKERS

### Men's Reply to Masters

THE Electrical Trades Union has replied to the letter from the London Electrical Masters' Association, given on p. 696 of our last issue. Following the receipt of this letter, a meeting was held on Monday, when the following resolution was passed:—

"This meeting of members of the Electrical Trades Union instructs the London District Committee that they cannot accept the terms of the letter of December 8th from the London Electrical Masters' Association, and cannot enter into negotiations excepting the questions to be discussed by the suggested conference are dealt with on their merits, without any previous conditions being exacted and without prejudice."

This resolution has been communicated to the masters, and in an accompanying letter it is stated that the suggested conditions contained in the masters' communication have never before been put to or agreed upon by any workmen's association previous to the questions at issue being discussed. We understand that the only dissentients from the above resolution were those who desired immediate action to be taken.

We have received the following letter from Mr. J. Potter, London District Secretary of the Electrical Trades Union. The statements he makes are in direct conflict with those made to our representative last week by Mr. Duncan Watson himself:—

"DEAR SIR,

"I notice in last week's issue of your journal that a report is given of the strike which has occurred at the new buildings which are being erected for the Pearl Life Assurance Co. in Holborn, together with an interview with Mr. Duncan Watson who is the Contractor for the electrical installation of the premises. The statements contained therein are fraught with several inaccuracies, though the responsibility does not rest with you.

"A stranger reading your report would reasonably believe that Mr. Watson is one of the most fair and impartial of employers but our experience has been entirely to the contrary, in fact I do not think it any exaggeration to state that he has given us as much trouble to obtain for our members reasonable conditions, as any other two Contractors in London. Two years ago Mr. Watson was not paying to his wiremen more than 9d. an hour; I am given to understand a considerable number were receiving less. At that time several of his men joined the Union with the hope of securing an improvement in their conditions and we reported the firm to the Home Office in connection with the contract at Wormwood Scrubbs Prison, with the result that one of the men at least had a sum considerably in excess to that stated last week refunded to him. This apparently did not suit Mr. Watson, who informed the members of the Union that he would refund all the monies they had paid if they would sever their connection with us; if not they would have to leave his service, several remained with us.

"Later, having previously approached the Pearl Co., with regard to the contract, we heard that Messrs. Duncan Watson & Co., were to do the work on the building in Holborn, and that he was paying lesser rates than those obtaining with the reputable firms of the Metropolis. Negotiations ensued with the Assurance Co., the Architect, and Mr. Watson, but owing to their protracted character a considerable portion of the work was completed before the latter gentleman could be induced to pay a maximum with him, of 9½d. an hour, and that only occurred a few months back. Since then we have approached the men to join with us, but the previous experience seemed to be a barrier, so our General Organiser secured a letter from Mr. Watson stating they could decide for themselves. In order to counteract this letter Mr. Watson convened a meeting of his men in his own time at his Office, which was addressed by Mr. Pulvermacker, one of the principals of the firm.

"During the afternoon I received information that this meeting was taking place, attended, and sent in the information that I was there. It was certainly left to the men to decide whether they would hear me, and it is certainly humorous that Mr. Pulvermacker had hardly disappeared round the corner before they invited me up to the room. Having addressed them for about half an hour and answered quite a volume of questions, I also left. On a secret ballot, twenty-one out of twenty-three present decided to join, one remaining neutral, and one

only hostile to the Electrical trades Union, the vote being taken when I was not present.

"This result was not anticipated, for a further meeting was called, Mr. Watson with his Engineers being present. At this meeting I am given to understand the men were told, 'that they were to decide for themselves whether they would join the Union, but they must clearly understand that there would be a breach in that confidence which had existed in the past, which might never be healed,' and to use a vernacular phrase 'that done it.' Personally I think these men bear a very strong resemblance to sheep, and one of their number confessed they did.

"Up to that time not one of Mr. Watson's employees had ever received more than tenpence an hour, these being charge hands, the wiremen with very few exceptions more than ninepence, shortly after these men received an increase of one halfpenny an hour.

"Our members contend that the Electrical Trades Union has been largely responsible for this result, and that they have a just claim in demanding that these men should bear their burden of the responsibility, and that can only be done by their joining the organisation, therefore they have refused to work with them.

Yours faithfully,

J. POTTER,  
District Secretary."

Work is proceeding upon the Pearl Assurance building, although none of the strikers have resumed.

## CORRESPONDENCE

### ELECTRIC CIRCUIT THEORY AND CALCULATIONS.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—I thank you for the review of the above book, which appeared in your issue of the 11th inst. At the same time, I should like to be allowed to comment on the following two observations made by your Reviewer:—

(a) "But little space is devoted to the magnetic circuit."

(b) "It seems wrong to assume that the reader is more likely to have a knowledge of elementary electricity and magnetism, and yet not know how to multiply and divide decimal fractions."

As regards (a), I was not aware that any space at all had been given to the magnetic circuit. There is certainly not a single numerical example relating thereto, and this omission is intentional; for, as stated in the Preface, "the magnetic circuit, which concerns design work more than installation work, is ignored altogether." Your Reviewer might have pointed out the advantage of this procedure.

As regards (b), your Reviewer ought to know that there are plenty of what might be termed "ordinary electrical workers" who would be quite at sea with decimals. It would have been more effective had he expressed an opinion on the Arithmetical Section as a whole, which had considerable care devoted to its 44 pages. It is not supposed that every reader will want to read this section, but it is there for those who do.

Further, as regards (b), I do not think it illogical to assume that some readers might have an elementary knowledge of electricity and magnetism and yet not be *au fait* with the matters dealt with in the Arithmetical Section, which, by the way, extend a good deal beyond the multiplication and division of decimals. It is specifically pointed out in the Introduction that those who have not the aforementioned knowledge should straightway acquire it.

I should like to say, in conclusion, that the contents of the book are founded on fairly intimate knowledge of what is required by its intended readers, and also that it has been exceptionally well received by teachers of wide experience.

I am, sir,

Yours faithfully,

W. PERREN MAYCOCK.

West Norwood, December 13th.

[The main duty of a reviewer is to make clear the scope of the book he is reviewing, and to let it be understood to what class of readers it will be useful. This, in our opinion, he has done with accuracy and discretion; our readers, after perusing Mr. Maycock's long letter in addition, will now possess the fullest possible information.—Ed. E. E.]

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published December 11th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

26,548/12. **Incandescent Lamps.** J. R. QUAIN. The filament is wound in a helical groove on a silica core mounted in the lamp socket. Filament breakage is said to be reduced. One figure.

26,726/12. **Course Recorders.** E. C. VILLIERS. A magnetic wheel works over the surface of an iron plate to which it is attracted. The direction of this wheel is taken from the compass, and the speed is taken from engine, propeller, road wheels, &c., as convenient. Four figures.

29,268/12. **Unidirectional H. P. Discharges.** O. J. and L. LODGE. Vacuum valves and a mechanical interrupter are connected in series in the secondary circuit of an induction coil. The valves are isolated by the interrupter, except at special moments in the cycle. Three figures.

3,864/13. **Heating Elements.** A. C. MICHIE and R. A. S. PAGET. Spiral or straight flexible wires are drawn into tubes of fused silica or other refractory material bent into tortuous curves by means of gaseous or liquid suction and pressure with or without mechanical vibration. Nine figures.

5,173/13. **Magazine Arc Lamps.** A. E. SPENCER and JOHNSON & PHILLIPS. The feeding tappets traverse a path at a slight angle to the longitudinal axis of the carbons in the magazine. The carbon about to come into operation is guided so as to become inclined to the remaining carbons, and to displace the burning carbon till it assumes its normal position. Two figures.

6,192/13. **Synchronising Clocks by Wireless.** R. L. DES ORDONS. A selection is made from the signals received by a station, depending on their duration and the intervals between them. The circuit of an electromagnet is closed by each signal and controls a second electromagnet. The switch contacts remain closed for a certain time after the first electromagnet ceases to be energised, so that signals separated by a shorter interval than that for which the contacts are closed result in an uninterrupted current in the second electromagnet. Five figures.

### Specifications Published To-day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Names in italics indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B.T.-H. Co. (*G. E. Co., U.S.A.*) [Resinous and wax-like condensation products] 24,254/12; WATERS [Protective systems] 26,961/12; B.T.-H. Co. (*A.E.G.*) [Control systems] 27,236/12; MARTIN [Grips for wires] 78/13.

**Dynamos, Motors and Transformers:** B.T.-H. Co. and WHITAKER [Rotary converters] 26,680/12.

**Electrometallurgy and Electrochemistry:** KENDALL [Treatment of alkali chlorides] 26,896/12; SIEMENS & HALSKE [Electrolysis of halogen alkalis] 18,102/13; Soc. ANON. L'OXYDRIQUE FRANÇAISE [Industrial electrolysis of water] 18,818/13.

**Heating and Cooking:** UNIT ENGINEERING Co. and BROWN [Water-heaters] 759/13; ARPIN [Heaters] 10,289/13; MARKS (*Landers, Frary & Clark*) 10,579/13; JUNG [Food-warmers] 18,592/13.

**Ignition:** VON KLAEDEN [Conductor for explosive charges] 17,261/13.

**Incandescent Lamps:** FULLER, 5,209/13; PLECHATI [Connecting filaments to leading-in wires] 13,406/13.

**Storage Batteries:** WACKWITZ [Grids] 15,719/13.

**Switchgear, Fuses and Fittings:** MIDDLETON, BAKER, FARNDON and MORRIS [Motor starters] 26,912/12 and 24,054/13; B.T.-H. Co., ASH and WATSON [Automatic slip regulators for induction motors] 27,011/12; LEDUC [Permutation switch for bolts, alarms, &c.] 27,609/12; [Bolts for locks] 27,610/12; B.T.-H. Co. (*G. E. Co., U.S.A.*) [Switches] 4,835/13; B.T.-H. Co. (*A.E.G.*) [Fuse plugs] 5,523/13; RASCH [Switches] 8,665/13; POLLAK [Pressure regulators and switches combined] 15,950/13.

**Telephony and Telegraphy:** AHLEMEYER [Telephony] 7,221/13; SIEMENS BROS. (*Siemens & Halske*) [Telephony] 12,566/13; MEYER [Telephone table instruments] 14,780/13; SIEMENS & HALSKE [Relay] 17,137/13.

**Miscellaneous:** GIBBONS and BLAKE [Control of bulkhead doors] 19,192/12; ARON, WIENER and X.L. ELECTRIC Co. [Clocks] 19,257/12; PEDERSEN [Variable speed gearing] 26,760/12; EVANS (*Deutsche Maschinenfabrik A.G.*) [Pulley block] 28,665/12; STOCKDALE [Burglar alarms] 1,764/13; WILSON (*Wilson*) [Lock position indicator for railway carriages] 9,195/13; DORRICOT

[Tracker bars for musical instruments] 13,546/13; CARL ZEISS [Lighting system for cinematographs] 17,245/13; SENFFLEBEN [Submarine mines] 17,441/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, &c.:** KETTERING [Selective distributing systems] 7,545/13; LEC [Utilisation of oscillating current energy] 24,458/13.

**Electrometallurgy and Electrochemistry:** CHEMISCHE FABRIK VON HEYDEN A.-G. [Alkali metals and alloys] 25,957/13.

**Incandescent Lamps:** DEUTSCHE GASGLÜHLICHT A.-G. (AUGES) [Bulbs with reflector] 15,360/13.

**Instruments and Meters:** LEEDS, 25,716/13 and 25,717/13.

**Telephony and Telegraphy:** Soc. MARIUS, LATOUR ET CIE [Frequency transformer for wireless] 26,934/13.

**Traction:** FRENCH WESTINGHOUSE Co. [Railway signalling] 22,029/13.

**Miscellaneous:** OTTO [Dirigible torpedoes] 24,802/13; CLERC [Clocks] 25,977/13; GROSSHEINTZ [Artificial daylight] 26,117/13; POETZELBERGER [Musical key instruments] 26,388/13; SIEMENS & HALSKE [Rivetting] 27,050/13.

### Applications for Amendment of Specification

7,689/02. **A.C. Track Circuit Signalling.** J. B. STRUBLE. The Union Switch & Signal Co., of Pennsylvania, has made application for permission to amend this specification on the ground that "certain of the claims in their present form contain subject-matter which is anticipated."

4,677/06. **Enclosed Flame Arc Lamps.** A. BLONDEL. The patentee is seeking leave to amend the specification in order "to limit the scope of the patent." The gases are drawn immediately after their formation through an opening round the arc, and are returned, after purification through a lower co-axial opening, so that the rising gases directly surround the arc.

### Amendments made and Allowed

11,375/12. **Automobile Control.** M. L. WHITFIELD and C. C. COWAN. As a result of the extended investigation under Section 8 of the Act, a disclaimer has been inserted in this specification, which deals with a petrol-electric driving system.

### Opposition to Grant of Patents

3,878/12. **Shaft Rotation Indicators.** P. R. KEEPIE and H. M. R. MADDICK. The Comptroller has allowed the grant of the patent in spite of opposition. The invention relates particularly to the indication on a ship's bridge of the direction of rotation of the main propeller shafting.

5,692/12. **Shaft Rotation Indicators.** J. C. CLARKE and CHADBURNS (SHIP) TELEGRAPH Co. This patent, which has a similar object to the one above, was also opposed, but has been allowed.

### Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

25,186 of Dec. 19th, 1899. **Receiving Aerial Circuits for Wireless.** G. MARCONI and the MARCONI Co. The specification refers back to patents Nos. 12,326/98 and 6,982/99. The primary of an induction coil is connected between the aerial and a condenser. The detector is connected across the outer ends of the secondary, which is wound in two parts, while a local circuit is connected across the inner ends.

25,346 of Dec. 21st, 1899. **Perforators for Automatic Telegraph Transmitters.** A. S. FRAMPTON and F. L. MUIRHEAD. A construction is given by means of which the accurate lateral adjustment of the position of the base plate that carries the punch-block relatively to the spur wheel is obtained. A feature is that the punches are easily removed and replaced.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Switchgear, Fuses, and Fittings:** [R. HADDAN (*Elec. Device Co., U.S.A.*) [Motor controller which cannot be moved forward faster than at a predetermined rate] 18,744/02.

**Traction:** O. BÖHM and R. MENCKHOFF [Changing vehicle batteries] 17,349/01; E. W. HART and W. P. DURTALL [Electric transmission system for self-contained vehicles] 17,248/05; W. S. HAMM [Railway signal lamps] 2,375/07.

**Miscellaneous:** J. WATKINSON and A. E. PAYNE [Combined carbon and metal resistances] 19,219A/06; E. KLUPATHY and C. BERGER [Control of torpedoes and submarine mines] 18,025/08; H. BAUMGARTNER [Lift type apparatus to prevent sea-sickness on ships] 18,062/08.

## ELECTRIC TRACTION NOTES

The New York Central and Hudson River Railroad has recently ordered six 600-volt locomotives weighing 110 tons each. They will be able to develop 2,000 h.p. continuously or 2,600 h.p. for one hour. These figures are equivalent to a tractive effort of 14,000 lb. at 54 m.p.h. continuously, or 20,000 lb. at 49 m.p.h. on the one-hour rating. Thus trains weighing over 1,000 tons can be worked continuously. There are eight two-pole gearless motors, insulated for 1,200 volts, each driving one axle. The frame is of the articulated type with bogey guiding trucks at each end. The motors are provided with forced air ventilation. Ten similar but slightly less powerful locomotives are already in use.

The Board of Trade has called the attention of the Tramways and Light Railways Association to the following source of danger which may arise in tramcar controllers:—In the case of a recent accident, caused by a car getting out of control on a falling gradient, it was subsequently discovered that the insulation of one of the controller leads had become chafed in such a way that if contact took place with an adjacent (No. 3) terminal at the bottom of the controller, a short circuit across both armatures would be created, and the magnetic brake would thereby be rendered inoperative. The ordinary tests made before the car was put into service failed to detect any such short-circuit, but it was subsequently proved by trial on the ground that, owing to vibration or some other cause, contact did take place, with the result that a short-circuit of the nature mentioned above was established. The Association proposes to form a small special committee to go into the matter.

In giving its assent to a double-deck form of trolley bus for the Brighton to Hove scheme, the Board of Trade has stipulated that the vehicle must have an overall width not exceeding 7 ft. with a 10-in. ground clearance. The Hove Corporation suggest that the Brighton Corporation should use the vehicle on a trial route before finally adopting it.

There is some talk in financial circles of a rearrangement of the capital of the Underground Electric Railways Co. and the other companies affiliated with it, now that practically all the amalgamation schemes and agreements have been put into force, in order to bring into line the various classes of shares which now exist, with a view to putting the whole position on a more equitable basis.

Although not of a directly electrical nature, an interesting development has taken place in connection with the Oxford electric tramway dilemma. The Council does not appear anxious to take any immediate steps to secure the penalties from the National Electric Construction Co. which it can claim under the Acts of Parliament, neither has any agreement been made between the Council and the company as to running the tramways. In the meantime a service of motor omnibuses has been placed upon the streets, in spite of the fact that the Council has refused to license them. Curiously enough also in this case, the Council does not seem anxious to take legal proceedings against those responsible for this "illegal" bus service.

The Municipal Tramways Association is convening a conference of metropolitan tramway authorities with the view of formulating some scheme whereby the recommendations of the House of Commons Committee on Motor Traffic may be put into force.

The Highways Committee of the L.C.C. recommends an expenditure of £750 on the preliminary work of preparing plans, &c., for linking up the tramway system, and doing away with all "dead ends."

## TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The following details of the Constantinople telephones taken from the *Zeitschrift für Schwachstromtechnik* are of interest. The payments to the Turkish Government will comprise 15 per cent. of the total receipts, and also 14s. per mile of telephone line, while the Government have the right to purchase the undertaking after a period of ten years. The Company can employ non-Turkish officials and engineers for the first ten years only, and the Government can demand the establishment of a school of telephone engineering in Constantinople or the sending of suitable members of the Government staff to Europe for instruction. On account of the several languages spoken in Constantinople, every ex-

change official must speak at least three—French, Turkish and Greek—and other officials speaking the English, German, Armenian and Slav languages will be stationed in each exchange. The number of contracted subscribers has reached 3,000 already, of which one-quarter are private subscribers.

The *Elektrotechnische Zeitschrift* announces that the long-distance Pupin-coil (ELECTRICAL ENGINEERING, July 18th, 1912, p. 410, Vol. VIII.) telephone line between Berlin and Milan is completed, and is undergoing trials under the supervision of representatives of the three Governments interested, namely, Germany, Switzerland and Italy. Direct connections will also be made between Milan and Zurich and Basle by the Swiss Government.

Negotiations are in progress for the purchase by the Egyptian Government of the business of the Telephone Co. of Egypt, Ltd. The purchase price would be about £1,300,000. The Company's network comprises nearly 80,000 miles of line, of which 7,150 miles are in Cairo.

The last of the series of lectures on Wireless Telegraphy which Mr. J. St. Vincent Pletts, A.C.G.I. (Chief of the Patents' Department, Marconi's Wireless Telegraph Co., Ltd.), has been giving at the City & Guilds (Engineering) College, took place last Thursday. The chief subjects dealt with were directive aerials and wave meters. The best kind of directionable receiver, said the lecturer, is that type first used by Dr. Hertz, and the best transmitter is that in which two aerials, half a wave-length apart, are used. However, as the wave-length is usually very great, this scheme is not possible, but as an approximation the bent aerial is used. For direction finding two triangular-shaped aerials are frequently employed. These are arranged at right angles, and the fields due to each are combined. The secondary coils are turned on a vertical axis until the strength of the signals is a maximum, and the direction of the signals inferred. The directive aerial has also enabled duplex working to be effected. A receiving and transmitting aerial are erected at each station, and balancing aerials are added to each receiving aerial with appropriate connections, so that the transmitting aerial at one station does not affect the receiving aerial at the same station. The necessary distance between the aerials at each station is roughly inversely proportional to the difference between the two wave-lengths employed. The Einthoven or single-string galvanometer is often used for receiving, as it has a high natural period, and consequently atmospherics do not spoil the readings. The lecturer then dealt with the mathematics of the wave meter, and showed that if  $\delta$  is the decrement of the aerial circuit, and  $\delta_w$  is the decrement of the wave meter, then  $(\delta + \delta_w) = \pi(1 - \lambda^2/\lambda_w^2)\sqrt{C^2/(C^2_{max} - C^2)}$ . Two readings are necessary—one when the circuits are in tune, and one when they are out of tune. The currents in these cases are given by  $C_{max}$  and  $C$ .  $\lambda$  is the wave-length indicated by the wave meter when the circuits are in tune, and  $\lambda_w$  when they are out of tune. If the difference between the two readings is very small, then instead of  $(1 - \lambda^2/\lambda_w^2)$  we can substitute  $2(1 - \lambda/\lambda_w)$ . It is advantageous generally to use the former, as by the use of a thermal junction and unipivot galvanometer readings proportional to the square of the current are obtained, and if the second reading is half the first, then  $\sqrt{C^2/(C^2_{max} - C^2)}$  becomes unity. In conclusion, Mr. Pletts pointed out the multitudinous duties of a wireless engineer in undeveloped countries, and indicated the great possibilities for advancement for those taking up wireless work and prepared to go abroad.

The Consul-General for the Argentine in London announces that all ships entering or leaving Argentine ports with fifty or more persons on board must in future possess a wireless telegraphy installation under the charge of a competent operator. The range of the apparatus for ocean-going vessels is to be not less than 310 miles.

According to the *Elektrotechnische Zeitschrift*, wireless communication has been attained between the station at Brussels and that at Boma in the Belgian Congo, a distance of 4,000 miles.

**Birmingham & District Electric Club.**—Mr. W. Y. Anderson has been appointed President, and Mr. W. Fennell, of Wednesbury, Vice-President.

**Electric Ambulance Service for London.**—We referred recently to the scheme of the Metropolitan Asylums Board for maintaining an electric ambulance scheme throughout their area, similar to that now in operation in the City of London. This, of course, necessitated the Board taking control of the scheme so far as it affected the area of the London County Council, but this does not commend itself to the latter body, and a report by the General Purposes Committee seeks instructions to prepare a scheme for dealing with the L.C.C. area separately from the area outside the County which comes within the district of the Metropolitan Asylums Board.

— Notes on Tenders Invited and Prospective Business appear on p. 723. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**FITTINGS.**—The Edison and Swan United Electric Light Co., Ltd., have issued a new illustrated catalogue of fittings, which is a fine production, and contains particulars of the most up-to-date styles and designs. The letterpress is printed both in English and French, and the list shows a varied range of designs and prices to suit all requirements of fancy brackets, drop pendants, table standards, floor standards, hall lamps, bedroom pendants, &c., as well as a distinguished and wide range of electroliers and semi-indirect lighting fittings all well illustrated. We are informed that delivery of any fitting listed can be had within one week from receipt of order. A copy will be sent to electrical contractors, supply companies, show-rooms, &c., post free on application.

**SCHOLEY'S MAGAZINE.**—The December issue of the interesting little magazine brought out by Scholey & Co., Ltd. (151 Queen Victoria Street, E.C.), contains among other items a biographical notice with portrait of Mr. A. L. C. Fell, chief officer L.C.C. Tramways. Special articles deal with electric lifts, domestic vacuum cleaners, and tool steel gearing.

*Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."*

**CHRISTMAS PRESENTS.**—A booklet with this title, issued by the Electric Supply Publicity Committee, describes numerous electrical appliances suitable for seasonable gifts in an attractive way.

**METERS.**—We have received from the Allgemeine Elektrizitäts Gesellschaft an interesting and very well illustrated pamphlet, in German, describing the latest patterns of ampere-hour meters.

Maschinenbau A.-G. (Dessau, Germany) deals exhaustively with the construction and fitting of "Bamag" ball bearings and "Bamag" guide pulleys with guide rollers on ball bearings for all positions and for different powers. The balls and races set themselves automatically in a position perpendicular to the shaft, and they are either built up in a movable ring which is spherical on the outer edge, or in a movable housing. To protect a line of shafting from lateral motion, a ball bearing is placed by the driving pulley. The adjusting ring is so fitted into the body or housing of the bearing that it has no lateral motion. This thrust bearing, however, can only be used if the lateral pressure is small, otherwise a special bearing is necessary. The representative for the north of England and Scotland is Mr. C. A. Matthews (22 Bridge Street, Deansgate, Manchester).

**CALENDAR.**—The wall calendar of the D.P. Battery Co. is always artistic, and this season bears a fine coloured reproduction of a picture of Haddon Hall.

**MAZDA HOUSE NEWS.**—The December issue of this lively periodical of the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), illustrates a number of cases of efficient and effective illumination, gives interesting information to contractors, and is enlivened by many quaint flashes of humour.

### RECORDING INSTRUMENTS

A FINE new catalogue of recording instruments has just been issued by Siemens Bros. & Co., Ltd. (Woolwich). The ink recording instruments—ammeters, voltmeters, wattmeters—are now made in two sizes, with the paper strip 70 mm. and 120 mm. wide respectively, the former with roll chart only and the latter in forms with drum and roll charts. In the last-mentioned form there is greater variety of types of movement, and frequency and phase indicators are made, as well as ammeters, voltmeters, and wattmeters, for continuous and alternating currents. A very important feature of

FIG. 1.—SMALL PATTERN RECORDER.

FIG. 2.—MOVEMENT OF FERRARI'S ALTERNATING CURRENT RECORDER WITH PARALLEL PEN MOTION.

FIG. 3.—MOVING COIL RECORDER WITH DRUM CHART.

**ELECTRICAL SUPPLIES.**—New catalogues in small leaflet form dealing with steel conduits and fittings, rubber cables, and novelties in signs and illuminations for Christmas, are to hand from the Electrical Co., Ltd. (122-124 Charing Cross Road, W.C.).

**ACCESSORIES.**—We have received a copy of the latest catalogue to be issued by J. and H. Greverer (40 Southwark Street, S.E.). A very considerable range of wiring accessories, including bayonet and Edison screw lamp-holders, key and "pull-chain" switch lamp-holders, switches, adapters, and cut-outs is listed. We also note some lamp-holders for use with illuminations and temporary wiring generally, as well as some of the less common bayonet lamp-holders for special purposes. Combined aluminium lamp-holders and shades are among the other fittings listed.

**BALL BEARINGS.**—A catalogue from Berlin-Anhaltische

all these recorders is that the curves are traced in rectangular coordinates, greatly facilitating integration when required.

One form of the new small-sized instrument is shown in Fig. 1. It will be seen that the movement is provided with a vertical spindle. The pointer is curved at its front end, and its point describes a circular arc. The paper from the spool passes through suitable guides, which cause it to coincide with this arc on the line where the pointer bears upon it, and to become flat again at a distance of about 6 in. from the pointer. Hence, without any special arrangements, the division of the charts follows the same law as the natural scale of the instrument; the vertical spindle is also of advantage in reducing friction.

In the larger instruments the rectangular co-ordinates are obtained in a different way. A horizontal spindle movement

is employed with a special parallel motion for giving a straight line motion to the pen. An example of a continuous-current moving-coil recording ammeter with drum chart, shown in Fig. 3, makes this clear, and the linkages and slide at the top can be seen even better in Fig. 2, which illustrates the movement of a Ferraris or induction-pattern instrument for alternating current. A large variety of forms of instrument in different cases are listed with many useful accessories. For circuits where there is extremely rapid variation of current a form of recorder is employed where a periodic spark puncturing the paper replaces the pen and eliminates pen friction.

Complete outfits of recorders on boards or in cabinets are made up for special purposes, including tramcar testing. The list also includes full particulars of the Siemens-Blondel oscillograph.

### THE RODOLITE HEATER

WE illustrate in Fig. 1 the latest form of Bastian patent quartz tube heating element known as the "Rodolite" glower, which is being introduced by the Bastian Electric Heating Syndicate. The 10-in. glower can be made in this form up to 250 watts for pressures from 25 to 250 volts or

FIG. 1.—RODOLITE GLOWER.

over. The spiral of Tabasco alloy has a thread running through it, by means of which it is securely bound on to the quartz tube, and thus it can be freely handled without fear of disarranging the spiral. When the glower is placed in circuit, and current switched on, the thread "burns off"

2-KW. RODOLITE HEATER.

like a gas mantle, and the heat causes the spiral to assume a permanent set in the correct position. A 2-kw. heater fitted with these elements is shown in Fig. 2. It will be seen that with these new elements radiators of large power can be arranged in very compact form.

### LEAD COATING OF METALS

THE efficient protecting of iron and steel from corrosion and the preserving of tubes, castings and other metallic articles from acid fumes and corrosive liquors has always been of great interest to engineers and others. A process for coating metal articles with lead by electrolytic deposition to a thickness of about 1/16th of an inch has been introduced by Lead, Ltd. (1 and 2 Old Pye Street, Westminster, S.W.). Among the articles which have thus been treated are castings for centrifugal machinery, roof glazing bars and plates, springs, bolts and nuts, &c. The process, which is due to Mr. Sherrard Cowper Coles, is known as "Leadizing."

**Ediswan Concert.**—The second of this season's series of Staff and Foremen's Smoking Concerts given by the Edison & Swan United Electric Light Co., Ltd., was held at the Staff Café, Ponders End, on Friday evening, the 12th. Nearly 100 members of the staff and visitors enjoyed the evening of smoke and song. Mr. J. W. Elliott, of the Lamp Dept., was in the chair, supported by vice-chairman J. Davison, Engineering Stores Manager. Staff talent included Mr. W. W. Osborne, who sang "The Grenadier," and amused everyone with an excellent rendering of "Archibald."

### A CAPSTAN CONTROLLER

ELECTRIC capstans are appliances subject to very arduous usage in practice, and need, therefore, to be of rugged construction, while the control must also possess several automatic features. The two parts of the Igranite capstan controller, designed to fulfil these conditions, are illustrated in Figs. 1 and 2. The self-acting starting rheostat shown in Fig. 1 is controlled through the ironclad pedal switch shown in Fig. 2. The pedal switch has two sets of contacts—upper and lower—both of which must be closed to complete the circuits. The upper contacts are closed by depressing the pedal. The lower contacts are normally held by a detent, which is magnetically tripped if an overload occurs. When the detent has been tripped, the lower contacts can only be closed by removing the foot from the pedal, which, of course, opens the upper contacts, so that it is impossible to keep the circuit closed while an overload exists. The pedal switch acts as a master to control the self-acting starter, and as it handles only small currents (about 3-ampere), it is not subject to injurious sparking. The self-acting starter is fitted with an interlocked magnetically-operated clapper-type main switch (see ELECTRICAL ENGINEERING, Nov. 27th, p. 668; and Dec. 4th, p. 688). This opens and closes the motor circuit.

The following three outstanding advantages are claimed for the "Igranite" automatic capstan controller:—(1) Suitability for operation by such unskilled and heavy handed persons as shunters or dockyard labourers—absolutely mistake-proof; (2) All the parts are electrically interlocked with one another, and interchangeable; (3) The only piece of apparatus which need be in the capstan pit

FIG. 1.—AUTOMATIC MOTOR STARTER.

FIG. 2.—IRONCLAD PEDAL SWITCH.

(usually a damp place of limited dimensions) is the ironclad water-tight pedal switch. The remainder of the apparatus can be placed in any convenient position, where it may be subject to observation or inspection at any time without the necessity of opening the capstan pit.

### "WOTAN" HALF-WATT LAMPS

LAST week we had an opportunity of inspecting a range of "Wotan" half-watt lamps at Messrs. Siemens Bros. Dynamo Works, Ltd. (Tyssen Street, Dalston). The sizes which are being manufactured are as follows:—50-65 volts, 300, 500, 1,000 and 1,500 watts; 100-130 volts, 500, 1,000 and 1,500 watts; 200-250 volts, 1,000 and 1,500 watts.

The above is the range of lamps which it is hoped will be on the market shortly. All the lamps have Goliath E.S. caps. They will be supplied, if desired, with the upper half of the bulb obscured, and also for series burning. We are informed that they can be run well five in series, so that the 50-volt lamps can be employed to replace existing arc lamps on series circuits. The half-watt rating is based, we understand, on a life of approximately 1,000 hours. In appearance the lamps have long necks, the filament is wound in a fairly close helix so that it is a considerable length and of fair thickness, and it is zig-zagged between the supports, the number of zig-zags varying with the wattage of the lamps. The arrangement for supporting the filament seems to be strong, and we are informed that the mechanical strength of the lamp is very great, and that it will stand considerable vibration. The bulb is filled with an inert gas, the function of which in enabling a higher temperature of the filament to be obtained without blackening the globe has been explained in our columns on a previous occasion.

### A NEW FITTINGS SHOWROOM

ELECTRICAL contractors, consulting engineers, architects, &c., will be pleased to know that the British Thomson-Houston Co., Ltd., have recently opened a new fittings showroom at Mazda House, 77 Upper Thames Street, London, E.C. Here are exhibited, under the best conditions, all the varieties of scientific lighting units for which the Company is famed, and also a number of new types which have not yet been described or advertised. The B.T.-H. "Eye-Rest" system is given a good show, and indirect fittings of every size and description are hanging from the ceiling. Semi-indirect lighting is represented by a wide range of Alba, Veluria, Calla and glass bowl fittings, and direct lighting by Mazdaliar, Tungstolier and other fittings equipped with Veluria, Holophane, Pyro, Opalux or Sudan glass reflectors.

NEW SHOWROOM AT MAZDA HOUSE.

The new "Fostoria" glass table standards form an interesting feature of the showroom. In addition to the fittings mentioned above, there is a host of other material, such as wall brackets, pendants, illuminated flowers for table decoration, lamp radiators, convectors, vacuum cleaners (with several novel features, amongst which is a comparatively low price), Calorite flat irons, toasters and grills, pocket lamps, illuminated blocks, and so on. The room itself is a restful place, abounding in comfortable chairs and settees, under which is a thick pile carpet. The decorative scheme tends to light, neutral shades, French grey and cream predominating, so as to afford a harmonious background to the variegated display of fittings. The Company invite everybody who reads these lines to visit Mazda House showroom within the next few days.

### EARTHED WALL PLUGS FOR USE IN PRIVATE HOUSES

WHERE electrical apparatus is used in the neighbourhood of water-pipes or other metallic conductors at earth potential, it is essential to avoid risks of electric shock by earthing the enclosing covers. This precaution is made compulsory in factories which come under the Home Office regulations.

A. Reyrolle & Co., Ltd. (Hebburn-on-Tyne), have introduced a special design of wall plug for such purposes. The fitting is neatly enclosed in a metal cover and the plug portion is designed to lap over the socket in such a way that whether the plug is partially withdrawn or not, it is impossible to make accidental contact with the pins. The framework of the socket and also of the plug have proper arrangements for taking an earth connection. The earth wire at one end is wound round and soldered to a water-pipe. The other terminates on a screw which is visible on the outside of the plug socket. Several Borough Electrical Engineers are making a special point of earthing all cooking and heating apparatus on their mains. The greatest precautions are taken in factories to enclose all live conductors carefully, and to provide proper earthing arrangements for cases in order to avoid risks of shock to careless operators. These precautions are just as essential in the private house, especially where there are children. It is therefore to be recommended that the electrical equipment of the home should be entirely free

from such risks. The Reyrolle wall plug for domestic use is a decided step in this direction. The plug is perhaps

REYROLLE WALL PLUG WITH EARTHING ARRANGEMENT.

heavier than one generally associates with domestic work, but its design and finish are such that it is not unsightly or out of place in living rooms.

### A LARGE ELECTRIC SIGN

WE illustrate here a large electric sign which the Sun Electrical Co. (118 & 120 Charing Cross Road, W.C.) have recently erected at the Elephant & Castle Hotel. This is one of two recently erected for Sandow's Cocoa Co., the other being installed on the top of the dome of the Angel,

LARGE ELECTRIC SIGN AT THE ELEPHANT AND CASTLE.

Islington. Both are prominent features, and afford an exceptional advertisement, and it is noteworthy that notwithstanding the distance between the two buildings in question, each sign is visible from the other. Each letter in the sign is 2 ft. 9 in. high, and each sign contains just over 300 lamps.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

### Generating Stations, Sub-Stations, Mains, &c.

**Ashton-under-Lyne.**—Sanction has been granted to a loan of £18,552 for electrical extensions.

**Devonport.**—A 1,250-kw. turbo-alternator with converters, switchgear, &c., is required. The total extensions are estimated to cost £11,866.

**Holmfirth.**—A loan of £7,500 is to be taken up in connection with the bulk-supply scheme.

**Kirkby Stephen.**—The local gas company has decided to install an electric lighting plant, and to issue debentures to provide the necessary capital.

**Monmouth.**—The sum of £1,500 is to be spent upon bringing the cable system up-to-date.

**Portsmouth.**—An additional generating set is required.

**South Africa.**—According to the *African World*, a loan of £40,000 is to be taken up by the Graaff-Reinet Council for electric lighting purposes.

**Wigan.**—H.T. feeder cable, transformer and switchgear. Borough Electrical Engineer, December 29th. (See advertisement on another page.)

**Wolverhampton.**—Mains are to be extended at an estimated cost of about £200.

### Wiring

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Barnet.**—New infirmary.

**Bury.**—Electric lighting of Ainsworth Sanatorium for the Bury and District Joint Hospital Board. Clerk, Cross Street.

**Dewsbury.**—Electric lighting of Council schools.

**Edinburgh.**—Winter Gardens, West Princes Street. City Superintendent of Works.

**Herne Bay.**—Electrical installation for Board of Guardians.

**Heywood.**—New mill. Mutual Spinning Co.

**Leeds.**—Extensions of infirmary. Clerk to Guardians, South Parade.

**London: L.C.C.**—180 points at the Popham Road elementary school. (See advertisement on another page.)

**Redhill.**—New police and fire stations.

**Salford.**—New works after fire. Wilkes Bros., Brook Street.

**Smethwick.**—Extensions at Waterloo Road schools. Secretary, Education Committee.

**Warrington.**—Elementary school. Education Secretary.

### Miscellaneous

**South Africa.**—The Heidelberg Municipality is about to invite tenders for an electric lighting scheme, says the *African World*.

**Bradford.**—Traction motors, controllers, resistances, circuit-breakers, junction boxes, &c. Manager, January 3rd.

**Lowestoft.**—A loan of £1,500 for meters is to be applied for.

**South Africa.**—The South African Railways Administration invite tenders for 15,794 tungsten filament lamps. January 27th. Tender Board, S.A.R., Johannesburg. Copies of the specification may be obtained from the High Commissioner for the Union of South Africa, 32 Victoria Street, S.W.

**Swinton.**—A street-lighting scheme at an estimated capital cost of £1,621, and an annual maintenance cost of £550, is before the Council.

## TENDERS RECEIVED AND ACCEPTED

**Aberdeen.**—A contract for "Wotan" and "Tantalum" drawn-wire lamps and carbon-filament lamps for the Aberdeen Steamship line has been placed with Siemens Bros. Dynamo Works.

**Batley.**—The Corporation has accepted the tender of the Brush Electrical Engineering Co. for a 1,200-kw. Ljungstrom

turbo-generator. In making the recommendation, the Chairman of the Electricity Committee stated that the guarantees of the makers were such that there would be no risk in entering into the proposed contract.

**Bedford.**—Twenty tenders have been received for the mixed-pressure turbine, exciter, air filter and condensing plant, and two tenders for the water-tube boiler, mechanical stoker and coal-handling plant, included in the new scheme of extensions.

**Bournemouth.**—The tenders of the United Electric Car Co. for car bodies at £499 each, and the British Westinghouse Co. for electrical equipments at £343 each, have been accepted.

**Keighley.**—The tender of the Cedes Electric Traction Co. for the supply of trolley omnibus line equipment at £923 per mile, and four vehicles at £720 each has been accepted.

**Llanidloes.**—A seven years' contract for street lighting has been entered into with the local electric lighting company.

**London: Hammersmith.**—Fifteen tenders have been received for the supply of fifty arc lamps, and those of Siemens Bros. Dynamo Works and the General Electric Co. have been accepted.

**Plymouth.**—The tender of Johnson & Phillips at £581 has been accepted for the supply of switchboard panels. This was the lowest tender received.

**Sal.**—The following tenders have been received:—**Battery:** Premier Accumulator Co. (accepted); Tudor Accumulator Co., Hart Accumulator Co., Chloride Electrical Storage Co., D.P. Battery Co., Electrical Power Storage Co., J. Fuller & Son, Pritchett & Gold, Sandycroft, Ltd. **Booster:** Electric Construction Co. (accepted), Crompton & Co., General Electric Co., Mather & Platt, Veritys, Ltd. **Electromotors, Ltd., Electrical Power Storage Co., Siemens Bros. Dynamo Works, Lancashire Dynamo Co., British Westinghouse Co., Bruce Peebles & Co., British Thomson-Houston Co.**

**Walsall.**—A contract for traction-type "Tantalum" lamps for the local tramways has been placed with Siemens Bros. Dynamo Works.

**Wolverhampton.**—The tenders of Willans & Robinson at £18,159 for a 4,000-kw. turbo-alternator with condenser, &c., and Reyrolle & Co., at £650, for switchgear extensions, have been accepted.

The Edison & Swan United Electric Light Co., Ltd., has added two battleships to the list of those lighted with Royal Ediswan lamps, viz., H.M.S. *Emperor of India* and a Turkish battleship.

## APPOINTMENTS AND PERSONAL NOTES

Mr. J. S. Gibson, Shift Engineer at the Dewsbury electricity works, has resigned.

Mr. Sellars, at present heating and cooking representative in the West Ham Electricity Sales Department, has been appointed superintendent canvasser, in succession to Mr. Hellaby, recently appointed at Sunderland.

Switchboard attendants wanted for L.C.C. tramway sub-stations. (See advertisement on another page.)

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Price of Copper.**—Messrs. George Smith & Son, 5 Philpot Lane, E.C., inform us that the price of electrolytic copper bars, c.i.f. port of arrival, quoted on Tuesday night, was £66 15s. to £67 5s. (Last week, £66 15s. to £67 5s.)

FOR  
**STEAM JOINTS**  
USE

**JOHN HUDSON & CO.'S SUCCESSORS, Mansell St., London, E.**

## LOCAL NOTES

**Bury: Overhead Wires.**—The sanction of the Board of Trade is to be sought for the erection of an overhead line to the premises of the Bury Paper Making Co.

**Dewsbury: Conditions of Charge Engineers.**—The Association of Electrical Station Engineers has asked for an interview with the Electricity Committee to discuss the working conditions at the works, and one is to be arranged.

**Galashiels: Electric Supply.**—Messrs. Balfour, Beatty and Co., who recently promoted the Galashiels & District Electric Supply Co., have been in conference with the Council as to the terms upon which the company's undertaking might be acquired in the future, and also as to the charges to be made by the company in the meantime. The company's representative refused to give a guarantee as to charges, but anticipated that the charge for current for the small consumer would be 5d. or 6d. per unit, and probably 2d. per unit for power. The Council has decided to engage a consulting engineer to advise as to the steps it should take for protecting the ratepayers' interests by attempting to secure the insertion of clauses in the company's provisional order.

**Southampton: Electricity Undertaking.**—The disagreement between Mr. H. F. Street, the Borough Electrical Engineer, and the Chairman of the Electricity Committee on the question of charges, referred to in our last issue, was discussed at the Council meeting last week. A number of councillors aired their views, mostly in favour of the good work carried out by the electricity undertaking in the past, and the present satisfactory financial position, but as no recommendation was put forward by the Lighting Committee, no definite action was taken. Presumably, therefore, the present scale of charges will remain in force.

**Teignmouth: Electric Lighting.**—The Council has decided to abandon the idea of undertaking an electric lighting scheme itself, but will give facilities for a company to do so.

**Truro: Electric Lighting.**—As reported in our columns earlier in the year, the Truro Council were granted an electric lighting order by the Board of Trade. A communication has been sent to the Cornwall Electric Power Co. to ascertain the terms upon which a supply in bulk could be given to the Council.

**West Bridgford: Electric Supply.**—The Derbyshire & Notts Electric Power Co. intended to include this district in their bill which they are promoting next session to extend their present area of supply. The West Bridgford Council, however, having intimated their determination to keep the electric supply powers for the district in its own hands, the Company has dropped its proposal. The Council is to apply for an electric lighting provisional order.

**Whitstable: Electric Supply.**—Applications have been invited for subscriptions to an issue of capital by the Whitstable Electric Light Co.

**Fire at a Cable Works.**—The Chemical Laboratory of the St. Helens Cable & Rubber Co., Ltd., was burnt down on Sunday night, the 7th inst., but luckily without damage to the rest of the premises. Careful investigation proved that the Suffragettes had nothing to do with it.

**The New Ediswan Showrooms.**—In a recent issue some particulars were given of coming Ediswan events, and we are now able to supplement that information by further details. The policy of the company, summed up in a few words, will be to provide an up-to-date and efficient market for trade customers and their clients, for everything electrical. The new premises at 123 125 Queen Victoria Street will have a trade counter entrance at Nos. 228 and 229 Upper Thames Street, where arrangements will be made for a quick counter trade. Large stocks will be held in the building, and in addition the company will provide a rapid motor van service from the Ponders End works for bulk deliveries, and a motor trier service for small deliveries. The large showroom will be fitted with special consulting rooms for the benefit of the trade who may bring their clients, and will contain a selection of artistic fittings and apparatus second to none. In order further to promote rapid communications and deliveries, a private telephone line is being erected between the showroom and the works, and additional public lines are being connected to both these premises. It is anticipated that when all these arrangements are completed the trade will be provided with a highly organised distributing centre which will meet a long-felt want.

## COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &amp;c.

**Tramways Light & Power Co.**—This company, which has the controlling interest in the Derbyshire & Nottinghamshire Electric Power Co., Nottinghamshire & Derbyshire Tramways Co., Leicestershire & Warwickshire Electric Power Co., Midland Electric Light & Power Co., Ltd., and the Leamington & Warwick Electrical Co., is issuing £200,000 five per cent. debenture stock at 98.

**Companies Struck off Register.**—The names of the Mutual Electricity Supply Co. and the Premier Electric Lamp Co. will be struck off the register of joint stock companies in three months unless cause is shown to the contrary.

## NEW COMPANIES

**EDISON & SWAN ELECTRIC CO. (INDIA),** 36-7 Queen Street, E.C. Capital £10,000.

**ELECTRICALS.**—Cathedral Buildings, Dean Street, Newcastle-on-Tyne. Capital £10,000. Electrical and mechanical engineers.

**SOMERBY ELECTRIC LIGHT CO.,** 33 Regent Street, Melton Mowbray. Capital £1,000.

**STANDARD METER CO.,** Victoria Works, Narrow Lane, Whitefield, nr. Manchester. Capital £20,000. Manufacturers of electric and other meters.

**LLANIDLOES ELECTRIC LIGHTING CO.**—Capital £3,000. Registered by Roberts & Co., 63 Queen Victoria Street, E.C.

**WESCOSCOPE,** 5 Upper Mill Hill, Leeds.—To take over the business of electrical engineers now carried on by the Wright Electrical Sales Co., Ltd.

**CHINNERY'S,** 23 Old Street, E.C. Capital £2,500. Manufacturers of and dealers in electrical fittings and appliances, &c.

**ELECTRICAL WORKS (MILLER),** 16 John Street, Bedford Row, W.C. Capital, £25,000. To found electrical manufacturing in Germany and elsewhere.

**Electricity in the Printing Trade.**—A lecture on this subject was given by Mr. G. E. Phillips on November 22nd at a meeting at Nottingham of the North Midlands branch of the Printers' Managers and Overseers Association. Commencing with lighting, he emphasised the necessity for the avoidance of glare. In composing rooms he favoured lamps in opaque reflectors, which almost "hood" the light just above the eye-line rather than the absolutely uniform indirect lighting, but press rooms were best lighted with high candle-power units placed as high as possible with local lights fixed under the feed boards, &c., to assist in making ready. With regard to electrical driving, he showed the much greater economy obtainable by separate motors to each machine than by one prime mover large enough to drive them all together. He outlined the requirements of a controller for flat-bed press-driving, dwelling on the necessity for provision for "inching" without burning the contacts. The elaborate push-button control systems in use for driving large rotary newspaper presses by which the machine can be inched, started, accelerated, retarded, stopped, or locked from various positions were referred to. The Holmes-Clatworthy, and other systems of drive for this class of work were described.

**Ball Bearings.**—Some of the conclusions of Prof. J. Goodman contained in a Paper read before the Institution of Automobile Engineers on the design of roller and ball bearings may be of interest to electrical engineers, in view of their general adoption for motor bearings. He gave the following working formula for maximum safe working load in lbs. to the allowed:—
$$Kmd^2 / (nD + C'd)$$
 where  $m$  is the number of balls,  $d$ =diam. of ball in inches,  $N$ =r.p.m., and  $D$ =diam. of ball race from point of contact of balls. The constants  $C$  and  $K$  are as follows:—For thrust bearings,  $C=200$ , and  $K=500,000$  for flat races, 1,000,000 for hollow races, when the radius of the race is about twice that of the ball, and 1,250,000 when the radius is 9/16ths that of the ball. For journal bearings,  $C=2,000$ , and  $K$  has double the values given above. The lecturer said that roller bearings under very heavy load always showed a considerable end thrust, which seriously increased the friction of the bearing.

### SUMMARY

WE give the main clauses of the London Electric Supply Bill, which is being promoted by the County of London Electric Supply Co., on page 726.

A PAPER was read recently before the Birmingham Local Section of the Institution of Electrical Engineers by Mr. A. R. Everest, on the work of the International Electrotechnical Commission on Standardisation of rating of electrical machinery. (Page 726.)

THE I.M.E.A. Electric Vehicle Committee has appointed sub-committees, who will shortly proceed to detail work on the various questions which they are to take in hand. (Page 726.)

IN the discussion on Mr. H. C. Gunton's Paper on electricity in the Post Office, some indications of the present engineering tendencies were given. (Page 727.)

MR. H. L. SMITH discusses the cogging of induction motors in a Paper dealing with the design of these machines. (Page 727.)

A PATENT specification by H. Leiser is opposed by the B.T.-H. Co. on the ground of anticipation. The specifications published by the Patent Office on Thursday last include one by E. G. Waters for a system of feeder protection against faults, one for connecting metal filaments to leading-in wires by J. Plechati, as well as some relating to heating and cooking. Two patents relating to push-button electric lifts by H. Rowntree are about to expire after a full life. (Page 728.)

SUITABLE material for the tanks of oil switches, &c., is referred to in our questions and answers columns. (Page 729.)

WE give some details of the construction of a sensitive telephone devised by Mr. S. G. Brown. These telephones may be suitable for use as loud-speaking telephones for the electrophone service.—A high resistance telephone meter, to indicate at the subscribers' station the calls registered against him by the meter at the exchange, has been devised by the Engineering Department of the Post Office.—The question of the distribution of the final assets of the National Telephone Co. was considered by Mr. Justice Sargant last week. (Page 729.)

A DISPUTE has arisen between the Brighton and Hove Corporations as to the use of a trolley arm or flexible connection for the trolley 'buses. (Page 730.)

A FINE fitting equipped with glass spheres, and a new form of electric sign, are illustrated on page 731.

A NOTABLE advertising campaign is referred to in our Trade Section. (Page 731.)

A NEW power station is to be erected at Walsall; an expenditure of £60,000 is contemplated at Rochdale; £30,000 at Southend; £29,000 at Southwark; £9,000 at Hammersmith; and £6,000 at Stoke Newington.—A turbo-generating set, rotary converter, switchgear, &c., is required at Carlisle. (Page 733.)

SPECIAL attention is directed to the Barcelona Exhibition, to be held in 1915.—Complaints have been received with regard to the Chester Corporation's water-power generating station, in that it is alleged to have reduced the depth of water available for the steamboats.—A reduction has been made in the charges for power for heating and cooking purposes at Northampton.—A large power contract at Aberdeen has led to considerable controversy. (Page 734.)

### The London Electrical Engineers.

MONDAY, DECEMBER 22ND, TO SATURDAY, DECEMBER 27.—Headquarters open for Regimental business only.

MONDAY, JANUARY 5TH.—A. Company. Technical Instruction, 7 to 10 p.m.

TUESDAY, JANUARY 6TH.—B. Company. Technical Instruction, 7 to 10 p.m.

WEDNESDAY, JANUARY 7TH.—Recruits only. Infantry Drill and Technical Instruction, 7 to 10 p.m.

THURSDAY, JANUARY 8TH.—C. Company. Technical Instruction, 7 to 10 p.m.

FRIDAY, JANUARY 9TH.—D. Company. Technical Instruction, 7.30 to 9.30 p.m.

Special Class on Crossley Engine, 7 to 8 p.m.

SATURDAY, JANUARY 10TH.—Headquarters open from 10 a.m. till noon.

## LONDON ELECTRIC SUPPLY

AS so much interest is being taken in the scheme for the consolidation of London's electricity supply, foreshadowed by the Bill which has been deposited in Parliament, it may be of interest to give a few more particulars of the Bill itself which became available in printed form after our last issue.

The preamble, after explaining how, by the Electric Lighting Acts of 1882 and 1909, the companies were prohibited from associating with any other party supplying electrical energy, but were allowed a certain amount of linking-up facilities by the London Electric Supply Act of 1908, and how the London County Council in 1910 received power to buy up all the companies' undertakings together in 1931, points out that as the proximity of this date of purchase creates difficulties in the way of "effectually carrying out in the most advantageous manner possible" the linking-up and consolidation provided for by the Act of 1908, it is expedient that the London County Council should be empowered to postpone the date at which, and to vary the terms upon which, the undertakings of the companies may be purchased.

The two main clauses of which the Bill consists, the general drift of which was indicated in last week's ELECTRICAL ENGINEERING, read as follows:—

(1) For the purpose of facilitating the making or carrying into effect of any association agreement between any two or more of the London Electric Supply Companies and notwithstanding anything contained in the London Electric Supply Act 1908 as amended or extended by the London Electric Supply Act 1910 and the London (Westminster and Kensington) Electric Supply Companies Act 1908 or any other Act any of the London Electric Supply Companies being parties to any association agreement or proposed parties to any intended association agreement on the one hand and the Council on the other hand may at any time within three years from the passing of this Act enter into and may carry into effect any agreement for the postponement whether conditional or otherwise of the date at which the Council may purchase the undertakings or any part or parts of the undertakings of such companies parties to any such association agreement or proposed parties to any such intended association agreement or any of them and for the variation of the terms and conditions upon which such undertakings or part or parts of undertakings or any one or more of them may be purchased and for making new provisions with regard to such purchase.

(2) Any agreement made under the powers of this section between the County of London Company and the Council may notwithstanding anything contained in the Electric Lighting Acts 1882 to 1909 or in the Romford Order provide for the purchase by the Council as part of the undertaking of the County of London Company of any generating station authorised by the Romford Order and in the event of any such agreement being made the rights (if any) of any local authority under the Romford Order or the Electric Lighting Acts 1882 to 1909 incorporated therewith to purchase any such generating station shall cease and such agreement may be carried into effect by the parties thereto.

**Metal Filament Lamp Patents.**—Wolfram-Lampen A.-G. successfully sued Mr. W. J. Johns, Mr. C. Harris, and Mr. C. Werth (who carried on business as the Oro Light & General Supply Co.) in the King's Bench Division last week for payment of £571 4s. for metal filament lamps supplied. It was argued for the defence that the lamps were bought on the understanding that the lamps did not constitute any infringement of the patent rights of Osram Lamp Works. They regarded this understanding as a warranty, and as they were unable to resist the successful proceedings for infringement by Osram Lamp Works, they refused to pay for the lamps. After hearing evidence, Mr. Justice Bankes decided that there was no warranty, and that all Wolfram-Lampen A.-G. did was to express its honest opinion that there was no infringement, therefore he gave judgment for this company for the amount claimed, with costs.

**Newcastle Local Section of the Institution of Electrical Engineers.**—The annual dinner of this section was held on Tuesday of last week, when an interesting speech was made by Mr. P. V. Hunter in proposing the toast of the Industries and Commerce of the North-East Coast. He looked to the facilities which they had for cheap electric power supply to bring back the chemical industries to their district, and foresaw great developments in that direction. Councillor Johnstone Wallace (Lord Mayor of Newcastle) replied, and Councillor H. Shaw (Sheriff) proposed the Institution, and Mr. W. Duddell, in replying, said that he believed that Tyneside was to be the leader in electrochemistry and electrometallurgy, as it had already led the way in steam turbines. Mr. W. Faraday Proctor proposed the toast of "Armstrong College," to which Dr. Hadow replied, and the toast of the visitors, proposed by Mr. W. C. Mountain, was replied to by Sir Charles Parsons.

## STANDARDISATION OF ELECTRICAL MACHINERY

A PAPER by Mr. A. R. Everest on the work of the International Electrotechnical Commission on standardisation of the rating of electrical machinery was read before the Birmingham Local Section of the Institution of Electrical Engineers on Dec. 10th. The author said that the rules adopted at the recent I.E.C. meeting in Berlin established the I.E.C. standard of quality, as regards temperature, for electrical machinery, but agreement was not reached on the further question of rating owing to differences of opinion regarding the value for the cooling air temperature. Although the life of the insulation really depended on the hottest internal temperature, it was sufficient to specify limiting observable temperatures as taken by thermometer. The following are the values for the quantity agreed on:—

Non-impregnated cotton, 80° C.; impregnated cotton or paper: general, 90° C.; single layer field coils, stationary or moving, 95° C.; stationary coils solidly impregnated throughout, 95° C.; rotor and stator windings having the slot portion solidly impregnated or moulded, 95° C.; enamelled wire (without cotton), 105° C.; mica, micanite, asbestos: general, 115° C.; single layer field coils stationary or moving, 120° C.; stationary coils solidly impregnated or moulded, 120° C.; windings permanently short-circuited: insulated, 100° C.; non-insulated, 110° C.; commutators, slip-rings, 90° C.; bearings, 80° C.

With regard to the vexed question of overloads, the I.E.C. has decided that any machine intended for continuous service should be ordered, designed, and rated for the highest load it is expected to carry, and that it should be capable of carrying this rated load continuously without exceeding the temperature limits of the table. No overloads are permissible beyond this rated load. As already stated, agreement has not yet been reached as to the maximum air temperature to be assumed in conjunction with the above figures for specifying temperature rises. Great Britain and the United States desired 40° C., and a minority of other countries desired 35° C. Finally the question was referred back to the National Committees.

## THE ELECTRIC VEHICLE COMMITTEE

THE third meeting of the Electrical Committee of the I.M.E.A. was held on Dec. 11th. A letter was read from Sir Edward Henry, Chief Commissioner of Police, regretting that he was unable to become a member of the Committee, but expressed his keen interest in the matter.

Mr. E. S. Shrapnell-Smith was elected to represent the Incorporated Motor Users' Association. The following sub-committees were appointed:—**Technical Sub-Committee:** Messrs. R. A. Chattock, F. Ayton, J. E. Edgcome, R. E. Mossay, E. S. Jacob, C. Jenkins, J. Christie, W. H. L. Watson, and the B.E.A.M.A. representatives of the dynamo, motor and switchgear sections; **Commercial Sub-Committee:** Messrs. R. A. Chattock, F. Ayton, F. E. Gripper, E. S. Shrapnell-Smith, A. H. Seabrook, A. C. Cramb, H. Faraday Proctor, W. S. Naylor, J. F. Monnot, W. R. Rawlings, and J. S. Highfield. The Technical Sub-Committee will consider arrangements to recommend for charging batteries; the most suitable sizes of charging outfits; instructions for charging batteries, rules for use in maintenance of electric vehicles; standard ratings for motors; standard battery voltages; standard ratings for commercial vehicles; wiring details; standard charging plug and receptacle; standard battery units; electric lighting on vehicles. The Commercial Sub-Committee will consider the drafting of a circular letter to electric supply undertakings re provision of charging facilities, tariffs, publicity, &c., insurance rates, parades and exhibitions; the collation and publication of information; taxation; maps and lists of charging stations, and advertising. With a view to the international standardisation of the charging plug and receptacle, the Secretary was directed to get into touch with the German and French Institutions of Electrical Engineers on the matter.

**Crystal Palace School of Engineering.**—The inspection of the various departments of the school and the ceremony of announcing the list of certificates awarded by the examiners, by Colonel Sir David Burnett, took place on Friday last.

**International Exhibition.**—An international exhibition of "Electrical Industries and their Applications" is to be held in Barcelona from March to December, 1915. The exhibition will admit all kinds of machinery, apparatus, processes, and raw materials for the production, transmission, or application of electrical energy. Applications for space should be made to the General Secretary of the Exhibition, Barcelona, before November 30th, 1914, and a copy of the prospectus, rules, and regulations may be seen at 73 Basinghall Street, E.C.

## ELECTRIC POWER IN THE POST OFFICE

THE Discussion at the Institution of Electrical Engineers last week of Mr. H. C. Gunton's Paper, "The Employment of Power in H.M. Post Office," was rather protracted owing to the large proportion of time devoted by various well-meaning speakers to mutual thanks, admiration and sympathy. We would suggest that it would be of advantage if this tendency were a little curtailed, so that members could have more time for intercourse after the meetings.

According to Mr. Gunton, Mr. W. Slingo (Engineer-in-Chief to the Post Office), and Mr. A. J. Stubbs (Assistant Engineer-in-Chief to the Post Office), the main object of the Paper is to show the world that the Post Office uses a vast amount of power for auxiliary purposes, and that its engineering is not confined solely to the sending of messages by telegraph and telephone; but it is hardly likely that such a gigantic and varied business as that now carried on by the Post Office could be successful without the extensive use of electricity. That the Post Office is very progressive in this direction at the present time is abundantly clear, while it also seems that any changes in the engineering practice are always delayed until it can be definitely shown that the new plant will be on a sound financial basis, and even then the conservatism of the staff seems to be an important factor in delaying alterations. A very important factor, which would perhaps tend to make the Post Office appear still more conservative than it is, is the fact that new appliances are often submitted without the design being such that it can work in with the specialised conditions prevailing. With regard to the proposed new tube railway, Mr. Slingo said that the Post Office was not looking out for something new to undertake, as had been suggested in some quarters. There were also some people who said that the Post Office did not need it, and that if they did they did not know how to make it nor how to use it when made. However, they did want the railway, and they were absolutely certain that it would result in a great financial saving as well as relieving the congestion in the streets. Mr. Slingo also said that it is the policy of the Post Office, when it contemplates adopting a new machine, first to build one and try it, and when satisfactory to call in contractors and let them improve it if they could. Whenever possible work is given to outside firms, but very often contractors cannot work so economically as the Post Office. It was formerly the practice with new cables, for the Post Office to buy the cable and draw it in and do the jointing itself, but extensive contracts were now out to see whether the whole operations cannot be done more economically by the contractors.

Major W. A. J. O'Meara, who opened the discussion, remarked that but little progress in the design of sorting machinery has been made recently in other countries. About eight years ago he went to the United States of America, and Mr. Gunton had been able to so improve the machinery being used there that he could now be said to be "leading the world" in this department. Mr. C. H. Wordingham (Chief Electrical Engineer to the Admiralty) commented on the arrangements whereby the high-pressure supply could be fed from the low-pressure supply, and in reply to a further remark by him, Mr. Gunton said that Post Office specifications were sectionalised. The first, or general part, varies in almost every case, while the following individual parts are built up of a number of "standard" leaflets. Mr. J. S. Highfield (Chief Engineer, Metropolitan Electric Supply Co.) remarked that it would seem that the cost of the electric supply to the Post Office is only a very small proportion of the total working costs, so that the greatest consideration is that of reliability. This would be better obtained by each Post Office having its own generating station and a standby battery. From considerations of comfort and space, however, in many cases the Post Office now purchases power from an outside source. He referred also to the difficulty which he had experienced in getting "men and machines to fit." Where a large number of men are employed it is necessary to improve the design of machinery very gradually. Mr. Roger T. Smith (Chief Electrical Engineer, Great Western Railway) described the Paper as a somewhat welcome departure from many Institution Papers, as it dealt with the design and working of machinery driven electrically, instead of with electrical machinery. He asked what was the proportion of the total energy required by the Post Office conveyors when running light. For lifting large loads he had found that the same amount of energy was used by crane, conveyor, lift, or tip to cover the same distance, but only in the case of the conveyor was practically a 100 per cent. load factor approached, therefore a very low charge for energy should be made in these cases. Mr. Gunton explained that they generally used low efficiency irreversible gearing for the conveyors so as to get greater safety, but lately they had been using high efficiency gearing, coupled with better brakes. It made little difference in the power taken whether the conveyor was loaded or not.

**British Electrical and Allied Manufacturers' Association.**—At the Council meeting held on the 18th inst., the following firms were elected members of the Association: Fraser & Chalmers, Ltd.; Johnson & Phillips, Ltd.; Thomas Kesnor & Co., Ltd.; The Record Electrical Co., Ltd.

## THE COGGING EFFECT IN INDUCTION MOTORS

A PAPER dealing with the electrical design of induction motors was read by Mr. H. L. Smith before the Rugby Engineering Society on December 9th. The design from a practical point of view, using standard frames, was clearly discussed, and various phenomena illustrated by five actual machines. It was pointed out that the "cogging" of squirrel-cage motors is due to zig-zag leakage, and may therefore be expected to be greatest in motors with short pole pitches and small numbers of slots per pole, i.e., in slow-speed motors, and least in high-speed motors. Therefore the rotor slots for machines with small numbers of poles can be larger and fewer in number than for machines with large numbers of poles without deleterious results. The practice of making the number of rotor slots incommensurable with that of the stator slots is effective so long as the rotor is central. But when the bearings wear, the bulk of the zig-zag flux is on one side and the stator develops a "governing tooth" and slot. As every rotor tooth passes the governing slot it makes it alternately easier and more difficult for the zig-zag leakage to pass, and the rotor tends to stick in the position of minimum reluctance. But the flux in the governing tooth is zero twice in a cycle, and at each of these two instants the rotor is free to move forward one rotor slot-pitch. If the zig-zag leakage is bad enough, the machine will continue to run at this peripheral speed of two rotor slot-pitches per cycle. A three-phase, squirrel-cage, 4-pole, 220-volt,  $\frac{1}{2}$ -h.p. motor, having twelve slots on the stator, i.e., one slot per pole per phase, and twenty-three on the rotor, with a dispersion coefficient about 17 per cent., exhibited this tendency well. The peripheral speed at synchronism of his machine is 11.5 rotor slot-pitches per cycle, and the speed of zero cogging two rotor slot-pitches per cycle or  $\frac{4}{23}$  that of synchronism, i.e., 260 r.p.m. Owing to the short-circuit current being smaller, relative to the normal current, than is the case with any ordinary motor, the rotor may be held stationary with full volts on the stator for quite a length of time without the machine getting unduly hot, or the applied voltage may even be transformed up when all these cogging effects are exaggerated.

**The Leeds Strike.**—As indicated in our last issue, the strike of municipal workers at Leeds has practically broken down, the authorities having taken the firm action of giving the strikers a date by which to send in their applications for resuming work. This seems to have had the desired effect in all departments except the gas works, but so far as the tramways and electricity departments are concerned, things have almost resumed their normal condition.

**The British Standard Meter Specification.**—Several practical points were referred to in the discussion at Leeds by the Yorkshire Section of the Institution of Electrical Engineers on Tuesday, December 9th, of Mr. S. H. Holden's Paper on the British Standard Specification for Consumers' Electric Supply Meters. The Paper itself was referred to in ELECTRICAL ENGINEERING, November 13th, page 626. Several station engineers spoke in favour of a standard arrangement and marking of terminals, and agreed that it was objectionable to have to drill the cases to fix labels. With regard to insulating materials, Mr. T. Roles (City Electrical Engineer, Bradford) was particularly against the use of ebonite. Other points mentioned were the necessity for provision for earthing the covers, and the desirability of limiting the losses in the pressure coil which sometimes gets so hot as to produce steam and spoil the bearings. Some speakers preferred glass to metal cases. It was also suggested that a general reduction in the speed of the main spindle would be an advantage.

**International Engineering Congress, 1915.**—Some further particulars are to hand of the International Engineering Congress which is to be held from September 20th to 25th, 1915, in San Francisco, in connection with the Panama-Pacific Exhibition. The sessions will be divided into eleven groups, one of which will be devoted to electrical engineering, another to mining engineering and metallurgy, another to the Panama Canal, and the rest to other branches of engineering, and numerous Papers are expected in each section. The Proceedings will be published in separate volumes for each section, and it may be noted that the Electrical Engineering volume will contain a certain amount of material from other sections, dealing with phases of contact or overlapping between electrical engineering and the various other branches of engineering work. All Papers and discussions will be printed in English. The fee for participation in the Congress is five dollars, including any one volume of the proceedings, but a further subscription, not exceeding \$3.50 each, may be made for other volumes. Excursions will be arranged to points of general and engineering interest in the district. Application forms for membership are being circulated, and any further information can be obtained from Mr. W. A. Cattell, Secretary-Treasurer International Engineering Congress, 1915, Foxcroft Building, San Francisco, Cal., U.S.A.

## "ELECTRICAL ENGINEERING" PATENT RECORD

*(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)*

### Specifications Published December 18th, 1913

A full list of these was published in our last issue. The following are abstracts of some of the more important specifications.

26,680/12. **Split Pole Rotary Converters.** B.T.-H. Co. and F. P. WHITTAKER. The auxiliary poles have a regulating winding, while commutating poles are excited with direct current from the armature. Frequencies as high as 50 cycles per sec. may be dealt with, and if the armature is rotated towards the auxiliary poles a leading current is taken from the line. Two figures.

26,912/12 and 24,054/13. **Induction Motor Starting.** V. G. MIDDLETON, C. J. BAKER, F. FARNDON, and D. K. MORRIS. To secure adequate protection against excessive current during starting and while running, it is claimed in the first specification to use a combined switch and automatic electromagnet and thermal circuit-breaker, in which the effective rating is altered by the pressure on the switch handle, causing closing, and restored when the handle is released. Adjusting means are provided. Seven figures. The second specification claims a switch for putting two fuses in parallel at starting and only one when running. Seven figures.

26,961/12. **Circuit Protection.** E. G. WATERS. To cut out a feeder on the occurrence of a fault, the primary of a bus-bar transformer is in series with two parallel feeders, in each of which is a current transformer. One coil of a reverse current relay is in the secondary circuits of these relays, while the other coil is in series with the secondary of the bus-bar transformer. One figure.

759/13. **Water Heaters.** UNIT ENGINEERING CO. and F. A. BROWN. A sectional heater has each unit made of two plates with openings so that a chamber is formed with inlets on one side and outlets on the other side. The heating elements are provided with similar openings to register, and are contained between the chambers. Four figures.

10,289/13. **Heaters.** C. ARPIN. A resistance wire is wound in a helix over a glass tube, which may have an internal core of metal for thermal storage, while a second glass tube surrounds the first. The outer surface of this tube is given a metallic coating, and is varnished so as to be a good radiator. Three figures.

13,406/13. **Attaching Metal Filaments to Leading-in Wires.** J. PLECHATI. The filament is pressed cold into the softer supports or leading-in wires by direct pressure, a hand press and die being used. Three figures.

18,592/13. **Food Warmers.** A. JUNG. The warming chambers are surrounded by water heated by a resistance helix in an annular space in the water. The helix is connected to a float, so that as the water-level falls it is compressed and *vice versa*. Two figures.

### Specifications Published December 24th, 1913

The following Patent Specifications are published on Dec. 24th, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 8d. each, post free.

Names in *italics* indicate communicators of inventions from abroad. Summaries of some of the more important of these patents will appear in our next issue.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** B. T.-H. Co. (*A.E.G.*) [Motor control] 27,624/12; B. T.-H. Co. (*G.E. Co., U.S.A.*) [Motor control systems] 3,685/13.

**Dynamos, Motors, and Transformers:** BROLT, LTD., BROOKS and HOLT, 27,664/12; PHENIX DYNAMO MFG. Co. and POHL [Rotary converters] 28,108/12.

**Electrometallurgy and Electrochemistry:** JOHNSON [Reduction of zinc ores] 27,881/12; MARINO [Salicylate electrolytes] 28,953/12; STASSANO [Furnaces] 22,723/13 and 22,724/13.

**Heating and Cooking:** BERRY [Cookers] 28,046/12; DOWSING and HUNTLEY [Element] 29,750/12; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Heating and drying] 3,148/13.

**Ignition:** LAWRENCE [Generators] 11,990/13.

**Instruments and Meters:** CAMPBELL, BLACKWELL and COLPITTS [Measuring circuit capacity] 2,009/13.

**Switchgear, Fuses, and Fittings:** CURTIS, MACKLEY and ADAMS MFG. Co. [Motor controller] 27,563/12; RAE and CUNARD STEAMSHIP Co. [Controllers] 28,605/12; HUBBELL [Lamp sockets] 3,682/13; LANGER [Automatic switch for illuminated advertisements] 9,769/13; HOVLAND [Relays] 11,131/13.

**Telephony and Telegraphy:** ZYVOSTENSKÁ BANKA V. PRAZE [Winding and starting the number switches for automatic telephones] 27,382/12; SIEMENS BROS. and PETTIGREW [Telephone selectors] 1,299/13; WADE (*Elektrizitäts A.G. Hydrawerk*) [Loud speaking telephone stations] 14,729/13; KNIGHT [Ships'

telegraphs] 15,123/13; LOGAN [Interrupters for telephone circuits] 17,775/13; SIEMENS & HALSKE [Telephone circuits] 21,222/13.

**Traction:** B.T.-H. Co. (*Curtis*) [Ship propulsion] 29,190/12; B.T.-H. Co. (*G. E. Co., U.S.A.*) [Vehicle trucks] 2,804/13; JEFCOATE [Railway signalling] 4,485/13; JOHNSON [Automatically stopping trains] 10,404/13.

**Miscellaneous:** LOWE [Batteries] 27,633/12; BEDFORD and ERDMANN [Catalysts] 27,718/12; NEUFELDT & KUHNKE [Gyro-compasses] 27,739/12; VARIABLE SPEED GEAR and ROBSON [Hydraulic transmission gear for vehicle lighting systems] 28,300/12; STEEL, PEECH & TOZER and BOWEN [Electromagnets] 29,863/12; DOUGLAS [Flash lamp for use as fog signal] 4,699/13; NATHORST [Magnetic separators] 12,368/13; OPPEN [Electrostatic machines] 24,911/13.

The following Specifications are open to inspection at the Patent Office before Acceptance, but are not yet published for sale.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** HEINS [Substitution resistances for lamps] 10,018/13; FELTEN & GUILLAUME CARLSWEEK A.-G. [Single conductor cut-out to come into operation upon a short-circuit or serious leakage occurring] 27,347/13.

**Incandescent Lamps:** SKAUPY [Electric gas lamps] 14,591/13; MOORE LICHT A.-G. [Vacuum light apparatus] 27,426/13.

**Instruments and Meters:** A.E.G. [Primary current coil bobbin] 21,959/13.

**Switchgear, &c.:** COLAS [Brushes] 23,754/13.

**Telephony and Telegraphy:** SIGNAL GES. [Radiating system for wireless signalling from aeroplanes] 23,728/13; PARRA [Fixing cables to insulators] 26,600/13; SIEMENS & HALSKE [Telephone circuits] 27,452/13.

**Traction:** SIEMENS-SCHUCKERT [Electric vehicles] 27,472/13.

**Miscellaneous:** KRUPP GRUSONWERK [Magnetic separators] 24,355/13; KRAUSE [Separating out dust particles suspended in gases by means of H.P. current] 27,059/13 and 27,060/13.

### Opposition to Grant of Patents

19,345/12. **Vehicle Lighting Dynamos.** S. L. PRICE. Opposition has been entered to the grant of this patent (*ELECTRICAL ENGINEERING*, October 30th, p. 608).

22,041/12. **Tungsten for Drawn Wire Lamps.** H. LEISER. Opposition to the grant of this patent (*ELECTRICAL ENGINEERING*, October 30th, p. 608) has been entered by the B.T.-H. Co. on the ground of anticipation by patent No. 8,031/10.

### Appeal from Comptroller's Decision

9,673/12. **Direction "Tell-Tales."** J. C. CLARKE and CHAD-BURN'S (SHIP) TELEGRAPH CO. The Comptroller's decision to allow the grant of this patent in spite of the opposition is being appealed against.

### Expiring and Expired Patents

The following Patents expire during the current week, after a *life of fourteen years*:-

25,767 of December 30th, 1899. **Adjustable Speed D.C. Lift Motor.** H. ROWNTREE. Both armature and field are revoluble and speed adjustment is effected by adjusting the current supplied to either, one of which is rotated by a separate motor. Two figures.

25,768 of December 30th, 1899. **Lift Push-button Control System.** H. ROWNTREE. The system is inoperative so long as any well gate is open, and when a push-button is operated at a landing or in the car the operation of any other push-button is ineffective until the cycle of operations set in motion by the first is complete. Five figures.

The following are the more important Patents that have become void through non-payment of renewal fees.

**Distributing Systems, Cables and Wires, Insulating Materials, &c.:** S. WATKINS (*Consolidated Rly. Elec. Ltg. & Equip. Co., U.S.A.*) [Electro-magnetically controlled train-lighting equipment] 17,601/01; V. P. VON PINDTERSHOFFEN [Non-hygroscopic conduits and joints for mains] 19,861/06; SIEMENS DYNAMO WORKS, C. A. ABLETT and H. CROWE [Driving rolling mills] 18,575/08.

**Dynamos and Motors:** B.T.-H. Co. (*A.E.G.*) [Commutators] 18,460/08.

**Switchgear, Fuses, and Fittings:** C. C. GARRARD and FERRANTI [Adjustable time lag circuit breaker] 19,570/07.

**Telephony:** I. B. BIRNBAUM and H. G. WHITE [Step-by-step selector switches] 17,957/05.

**QUESTIONS AND ANSWERS  
BY PRACTICAL MEN**

**RULES.**

**QUESTIONS:** We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

**ANSWERS:** A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

**QUESTION No. 1371.**

A 230 volt installation is running on a circuit containing several electric cranes and other motors. An earth is reported on the main board, and in investigating this, two 230 volt 16 c.p. lamps in series were connected between the negative main and earth, and showed a red glow. When they ceased to glow they were tried on the positive side and glowed again. This change over occurred several times a day. Sometimes, however, the lamps would show a full light, which indicated that about 460 volts was present between one pole and earth. How can this be explained?—CONSTANT READER.

(Replies must be received not later than first post, Monday, January 5th.)

**ANSWERS TO No. 1,367.**

The composition of an oil-resisting alloy is required, suitable for cast-metal tanks, for use with oil-immersed apparatus; the alloy must have been found successful in practice, and be inexpensive to make. Any special foundry precautions should be stated.—"U. R."

The first award (10s.) is made to "L. B." who writes as follows:—

The largest electrical manufacturers in this country for cast tanks of oil-immersed apparatus use ordinary cast-iron. These are thoroughly galvanised both inside and out, thereby closing all pores. No special mixture or foundry precautions are required apart from the general practice. The tanks are cleaned after casting by air or sand blasting, then pickled in weak sulphuric or hydrochloric acid solution. To remove any traces of grease, bath in potash or soda solution, and finally cleanse in hot water. After thoroughly drying, they are then galvanised by the ordinary dipping process.

There is a special aluminium alloy also suitable which is occasionally used where the magnetic effect of cast-iron would be detrimental, but sheet-steel is often preferable.

No second award has been made.

**The New and the Old.**—The famous Egyptian temple of Rameses II., over 3,000 years old, is now illuminated by electric lamps for the benefit of tourists. It is also stated that the big bronze Buddhas in the temple at Nikko, Japan, have recently been modernised by having the candles in the eyes replaced by tungsten filament lamps. Nikko receives electric power from a hydro-electric plant.

**TELEPHONY AND TELEGRAPHY  
(INCLUDING WIRELESS)**

Some particulars appeared in *ELECTRICAL ENGINEERING* last week of experiments with Mr. S. G. Brown's telephone relay, and also with a German relay, on a long telephone line between London and Cologne. In addition to Mr. Brown's relay being used for telephony, it has been employed to a considerable extent in wireless telegraphy to reinforce the currents at the receiving end. The relay for this purpose differs in some respects in design from the one employed for telephony, but the main principle of the secondary contacts being made by a reed, the tension of which is balanced by a magnet, is the same. Mr. Brown has also been giving considerable attention to the design of a sensitive telephone, particularly for receiving wireless telegraph signals. Instead of the usual diaphragm, he employs one of conical shape, made of very thin aluminium sheet about two-thousandths of an inch thick, the centre of which is fixed to the end of an adjustable reed which is acted on by the receiver magnet. The diaphragm is held in position by a paper or collodion edge. This has the advantage over the ordinary diaphragm that the diaphragm itself is far less rigid and in consequence more sensitive. The natural period of vibration of the system can be adjusted by means of the reed, and the arrangement also enables the magnetic circuit to be considerably better than in an ordinary receiver and the air gap to be adjusted with accuracy. In place of one central hole in the ear piece, several smaller holes are employed. With these telephones we understand very much smaller currents can be heard than with the ordinary types; in fact, some experiments have elicited that their substitution for an ordinary telephone receiver increases the range of audibility by the equivalent of five miles of standard cable. Experiments with these are also being conducted in connection with the electrophone service with a view to developing a loud-speaking electrophone receiver so as to obviate the use of listening tubes.

Owing to the large number of complaints received by the Post Office from telephone subscribers on the message rate that they are being overcharged, the Engineering Department has for some time been conducting experiments to see whether a check meter, situated at the subscribers' end of the line, could be devised which would be adaptable to all the different systems in use in this country. Although, possibly, finality may not yet be reached, a very simple arrangement has been evolved which on test has proved itself to be reliable. A high resistance electromagnet of about 4,000 ohms, entirely copper-clad, actuating a "Veeder" dial through the usual mechanism, is fixed to the subscriber's instrument. It is connected between the ringing line and earth, and is arranged so that, as the armature is attracted, the circuit of a 1,000 ohm resistance in parallel with the 4,000-ohm winding is closed, so that an augmented current flows over the line. This current, when augmented, passing through a relay at the exchange lights a lamp on the switchboard, and so indicates to the operator that the call has been recorded at the subscriber's end. The new meter, which is in addition to the meter at the exchange, is worked by the operator by the same meter key through a relay in the existing cord circuit, which connects an 80-volt battery to the answering relay between the line and earth. The subscriber's meter is not affected by the usual ringing current, as the copper covering of the coil gives it sufficiently high inductance to prevent any considerable alternating current from passing through it. As the addition of subscribers' meters would add to the complexity of the subscribers' equipment and necessitate increased maintenance charges, it is probable that any subscriber desiring this meter would be called on to pay about 10s. per annum extra rental. It will be seen from the above that the meter is no more likely to register ineffective calls than the one at the exchange, in conjunction with which it

works, and is dependent on the operator to the same extent. The subscriber can, however, immediately notify the exchange if he sees an ineffective call registered. Without great alterations to the present system, automatic meters are only possible on automatic systems where there is no possibility of wrong numbers being given. An interesting metering arrangement at the subscriber's end in this case consists of an arrangement whereby the calling subscriber's transmitter is out of action, although the called subscriber can be heard in the receiver, until the calling subscriber depresses a button in his instrument, and so registers the call.

The question of the distribution of the remaining £65,000 of the National Telephone Co.'s assets was considered by Mr. Justice Sargent on Thursday last week. He referred the matter to chambers for inquiry, and directed advertisements of the proposed distribution to be issued. Although it was decided last July that the surplus assets be distributed among the deferred stockholders, the £65,000 was kept back so that claims against the assets could be met. Although it had been notified that all claims must be proved before August 25th last, the claims which had come in since have been paid. The liquidator said that he was anxious to distribute the £65,000 among the deferred stockholders, but felt that it was not quite safe to do so without the direction of the Court.

A Paper of an unusual nature, but both interesting and valuable, was read before the Institution of Post Office Electrical Engineers on November 10th by Mr. Harvey Smith. It dealt with the question of provision for future requirements when laying telephone cables and the pipes for them. Assuming, for instance, that it is estimated that 300 lines will be required on a particular route during the next 15 years, will it be most economical to lay a 300-pair cable from the outset, or a 150-pair cable now and another in eight years, or three 100-pair cables, four 75-pair cables, or six 50-pair cables at suitable intervals of time; and again, if it pays to adopt one of the latter alternatives, will it be best to lay all the pipes at the outset so as not to have to open the ground again? The Paper explains how such problems as these are dealt with, on the basis of calculating the "present value" of the annual interest, maintenance, and depreciation charges on the various alternatives over 25 years. Several examples are worked out in the Paper, but as these are based on paying only 3½ per cent. interest on capital, the general con-

clusions summarised by the author at the end of the Paper are not generally applicable, except to British Post Office work.

Some of the members of the Hull Telephone Committee are not altogether in agreement with the recommendation to purchase the system which the Post Office recently acquired from the National Telephone Co. on the terms announced on page 685 of our issue for December 11th. The feeling is that this price is too high, having regard to the number of years' use of the plant, but a special meeting of the City Council is to be held to discuss finally the matter before any definite agreement with the Post Office is entered into.

The death is announced at Kingston-on-Thames, at the age of eighty-six, of Mr. J. W. Wilkins, an early pioneer in telegraph and wireless telegraph work. Mr. Wilkins was associated with Cooke & Wheatstone.

The Coventry Local Advisory Telephone Committee has been notified by the General Post Office of the establishment of a new and larger telephone exchange, possibly an automatic telephone exchange, and additional cables from Coventry to Birmingham.

An expenditure of £40,000 is contemplated upon additions to the Post Office telephone system in Bristol, both as regards the local and trunk line services.

An interim dividend of 10 per cent. has been announced on the ordinary shares of Marconi's Wireless Telegraph Co.

### ELECTRIC TRACTION NOTES

In response to the request by the Hove Corporation that the trolley omnibus sanctioned by the Board of Trade should be run by the Brighton Corporation on a test route before being put into service permanently, the General Purposes Committee of the Brighton Corporation has now specified a route for this purpose.

Another difficulty, however, seems to have arisen, and that is that the Hove Corporation is not agreeable to the use of trolleys, but prefers the flexible cable connection as used in the Cedes-Stoll system.

A proposal that all the electric railway, tramway and bus services in Berlin shall be amalgamated in a similar manner to what has taken place in London is under discussion.

## "ELECTRICAL ENGINEERING" TRADE SECTION

— Notes on Tenders Invited and Prospective Business appear on p. 731. —

### CATALOGUES, PAMPHLETS, &c., RECEIVED

**MEASURING INSTRUMENTS.**—A comprehensive list is to hand of "Nadir" electrical measuring instruments made by the Kadelbach and Randhagen electrical measuring instrument works of Berlin (42 Babelsbergerstrasse Wilmsdorf). This includes high-class accurate permanent magnet moving coil voltmeters and ammeters, insulation testers, and combination instruments for several ranges, in a number of forms, with portable shunts and series resistances where required. The firm also make up very conveniently arranged outfits with the necessary slide resistances and standard instruments for readily checking ammeters and voltmeters. A special section of the list is devoted to insulation testing sets, ohmmeters, &c., and among other items listed we find sensitive millivoltmeter moving coil galvanometer, resistances, relays, universal combination testing sets, and various accessories, and a special connection and resistance box to be used in conjunction with a voltmeter for fault localisation. Slide wire resistance bridges and electrical pyrometers conclude this very complete collection of apparatus.

**PHASE COMPENSATION.**—We have received from the Wagner Electric Manufacturing Company (St. Louis, Mo., U.S.A.) a pamphlet dealing with phase compensation, from the pen of Mr. Val A. Fynn, who is one of the Company's consulting engineers. The matter is a reprint of articles recently published in the *Electrical World* (New York). The author treats of the subject with especial regard to single-phase motors after having first explained the nature of a phase difference, the causes producing it, and the methods of control. The treatment is full and clear, and is enhanced in ease of understanding by 55 diagrams.

**LEADISING.**—A leaflet from Lead, Ltd. (1 and 2 Old Pye

Street, S.W.), gives illustrations of articles treated by the electrolytic lead covering process referred to on page 721 of last week's *ELECTRICAL ENGINEERING*, and gives particulars of the cost of current for depositing coatings of different thicknesses.

**FITTINGS.**—A card from Dugdell's Patents (Failsworth, Manchester) illustrates a very large number of tubular and other jointed fittings, the special feature of most of which is a patented self-sustaining joint which can be bent in any direction.

A cleverly arranged paper-weight from Ferranti, Ltd., forms a sort of circular slide rule for converting shillings and pence into decimals of a pound. This is very simple and easy to work, and will be much appreciated by the company's many friends.

We have received a useful blotter from the Hart Accumulator Co. (Marshgate Lane, Stratford, E.).

Alfred Graham & Co. (St. Andrew's Works, Crofton Park Road) are distributing to their friends a desk blotting-pad of convenient form combined with a diary.

### Shipping, Engineering, and Machinery Exhibition, 1914.

Arrangements are progressing for this exhibition, which is to be held at Olympia in September and October, 1914. The Dutch Government are organising a collective exhibit, and over 50 per cent. of the space is already booked. Among the names in the preliminary list of exhibitors we may mention the following:—Babcock & Wilcox, Ltd., British Vacuum Cleaner Co., Ltd., Electric Appliances Co., Ltd., Feld Bros. & Co., Ltd., Jacob White & Co., Ltd., J. Keith & Blackman Co., Ltd., Kelvin, Bottomley & Baird, Ltd., W. Kennedy, Magic Appliances, Ltd., Marconi's Wireless Telegraph Co., Ltd., Medway's Safety Lift Co., Ltd., Ozonair, Ltd., Pinchin, Johnson & Co., Ltd., Sunderland Forge & Engineering Co., Ltd., W. C. Tackley & Co.

## AN ALBA FITTING

IN a description of the lighting installation at the Balham Palladium, which appeared recently in these columns, reference was made to the Alba fittings employed there. It is now possible to give further particulars of this fitting, which was specially designed by the British Thomson-Houston Co. (Mazda House, 77 Upper Thames Street), for the Balham Palladium. This fitting, which is of Adams design, consists of a heavy chased corona suspended by four chains. Inside

FITTING WITH ALBA GLASS SPHERES.

the corona is fixed a 16-in. Alba glass sphere, and from each of the arms depends a 6-in. ball. One 200-watt and four 60-watt Mazda lamps are used in each fitting. The metal-work of the fitting is of polished brass; its overall length is 4 ft. and its diameter 2 ft. 6in. The fitting is a fine example of the combination of efficiency and beauty in the design of lighting appliances.

## A NEW ELECTRIC SIGN

THE Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex), have recently acquired the manufacturing rights of the patent "Ediswan-Zenith" light-

NEW ONE-LAMP SIGN.

saving sign (Beville's Patent). The chief feature of this new sign is the reduction in maintenance cost over other types, effecting a saving in upkeep of from 50 to 70 per cent. The

chief feature is the use of a simple device which diverts the light on to surfaces where it is alone required, thus effecting a considerable saving in upkeep; at the same time a brilliant and even light is diffused over the entire surface of display. The lamp itself is between patent distributing screens, at the same time throwing its side rays on to mirrors at either end of the sign, by virtue of which arrangement an even distribution of light over a large surface is obtained without glare, whilst in the case of either single or double-sided signs the width of the containing box is reduced to a minimum. This principle is applicable to facias, projecting signs, window signs, wall signs, and, in fact, to all signs illuminated from within.

## A NOTABLE ADVERTISING CAMPAIGN

THE General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), are carrying out a special advertising campaign on a very large scale in connection with the sale of their "Magnet" electric irons. Most of our readers will already have seen the four-page special advertisements which have been appearing in the *Daily Mirror*, which are extremely well arranged and effective. We are informed that nearly 200 electricity undertakings have interested themselves in the matter and distributed copies of this paper to all consumers on their mains, while over 600 contractors are co-operating in the scheme and have taken up a stock of "Magnet" irons in order to meet the demand that is bound to accrue. The Company are being particularly liberal in the terms that they are giving to agents, and are giving a bonus in the shape of a free kettle, toaster or hot-plate to those placing orders for a certain number of irons. Extensive advertising and window-dressing material has also been prepared for the use of contractors, and the General Electric Co. have fortified their own position as regards delivery by manufacturing a stock of over 40,000 irons for various voltages. The irons are being sent out complete with connectors, flexible cords and adapters ready for instant use, and another important feature of the scheme is the arrangements that have been made for giving anyone fifteen days' free trial of an iron and a three years' guarantee when purchased. The Company are to be congratulated on the enterprise and energy that they have shown in the matter, and fully deserve the large volume of business which their campaign, so suitably timed just before Christmas, is bound to bring them. The benefits to the contractors will be also on a large scale, and both the public and the supply authorities will reap great advantage.

## TENDERS INVITED AND PROSPECTIVE BUSINESS

## Generating Stations, Sub-Stations, Mains, &amp;c.

**Belgium.**—The Antwerp Municipal Authorities invite tenders by January 19th, 1914, for two transformer cabins, a supply of armoured cable, and seventy junction boxes. Further particulars, 73 Basinghall Street, E.C.

**Carlisle.**—The Electricity Department invites tenders for two 1,250-kw. high-pressure turbo-alternators with condensing plant, rotary-converters, switchgear, &c. City Electrical Engineer, December 31st.

**Grimsby.**—Mains extensions.

**Heywood.**—An expenditure of £3,000 upon mains and services is contemplated.

**Hornsey.**—A loan of £6,000 for mains extensions is to be applied for.

**London: Hammersmith.**—The Finance Committee of the L.C.C. recommends sanction to a loan of £9,427 for mains, sub-station plant, services and meters.

**Southwark.**—The Finance Committee of the L.C.C. recommends sanction to a loan of £29,334 for additional generating plant.

**Stoke Newington.**—The Finance Committee of the L.C.C. recommends sanction to a loan of £6,000 for mains.

**Rochdale.**—Sanction to borrow £60,000 is to be sought in connection with extensions at the power station.

**Southend-on-Sea.**—An expenditure of £30,000 on mains and feeders is contemplated, as well as the erection of two new sub-stations.

**Taunton.**—Application is to be made to the Local Government Board for loans aggregating £5,100 for extensions to the electricity undertaking.

**Walsall.**—It is stated that plans are being prepared for a new generating station at an estimated cost of £40,000. Mr. E. M. Lacey is the consulting engineer.

### **Wiring**

*The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.*

**Barking.**—New post office. H.M. Office of Works, London.

**Barnsley.**—New town hall.

**Belfast.**—Electric lighting of the workhouse.

**Croydon.**—Cinematograph theatre, Lower Addiscombe Road. G. W. Booth, Chandos Street, S.W.—Fifteen houses, Melrose Avenue, W. Aston, 218 Melfort Road.—Fifteen houses, Hythe Road, H. Harrison, 21 Raymead Avenue.

**Dawlish.**—New fire station, &c. Town Clerk.

**Devonport.**—Infants' school. Director of Education.

**Dundee.**—New school.

**Harrogate.**—New Council school. Borough Surveyor.

**Hull.**—Cinematograph theatre, Beverley Road. Architects, Wellstead, Dossor & Wellstead, Waterloo Chambers. Cinematograph theatre, Anlaby Road. Architect, H. P. Binks, 31 Scale Road.

**Macclesfield.**—New fire station.

**Margate.**—New town hall.

**Newcastle.**—Labour exchange, Wallsend. H.M. Office of Works, London.

**Pontypridd.**—Extensive alterations and additions to workhouse. Architects, A. L. Thomas and G. S. Morgan, 23 Gelliwasad Road.

**Richmond (Surrey).**—New cookery centre (£3,700).

**West Bromwich.**—New schools at Crotchills (£16,518).

### **Miscellaneous**

**Bristol.**—There is a prospect of considerable extensions to the street electric lighting in conjunction with a number of new streets which are to be built.

**Northampton.**—Tenders are invited for the overhead equipment, underground feeders, telephones, &c., for three miles of tramway extensions. Borough Engineer.

**Rawtenstall.**—It has been decided to substitute electric lighting for gas lighting along the main tramway routes.

## **TENDERS RECEIVED AND ACCEPTED**

**Norwich.**—The tender of Messrs. C. A. Parsons & Co. for a 3,000-kw. turbo-alternator coupled to two 1,200-kw. Siemens rotary converters at £8,578.

**London: L.C.C.**—The Edison & Swan United Electric Light Co. have been successful in securing the contract for the supply of Royal Ediswan drawn-wire tungsten filament lamps (British) to the London County Council, under Schedule 17.

**Admiralty.**—A contract for the supply of Royal Ediswan drawn-wire tungsten filament lamps (British) for H.M.S. *Tiger* has been placed with the Edison & Swan United Electric Light Co.

## **APPOINTMENTS AND PERSONAL NOTES**

We are very pleased to state that Mr. C. Turnbull, Borough Electrical Engineer at Teignmouth, who recently underwent an operation for appendicitis, is now progressing favourably.

The Erith Electricity Committee recommends that the salary of Mr. A. Coveney, Borough Electrical Engineer, shall be increased from £350 to £400 per annum.

The salary of Mr. G. Bryant, Borough Electrical Engineer, Yarmouth, is to be increased from £450 to £500 per annum by two increments of £50.

# OSRAM

## LAMPS

### Important Notice

## JUDGMENT

THE OSRAM LAMP WORKS, LTD., beg to inform the Trade and the Public that on November 26th, 1913, in the High Court of Justice, Chancery Division Mr. Justice Astbury **GRANTED AN INJUNCTION** against the **ORO LIGHT & GENERAL SUPPLY CO., LTD., 36, Cock Lane, Snow Hill, E.C.** (in default of defence), in the action against them instituted by the Osram Lamp Works, Ltd., for infringement of OSRAM Patents Nos. 23899★ of 1904 and 18622 of 1906 (the validity of which had been certified by the Court in a previous action) by the sale of

### **ORO LAMPS,**

stated by the Defendants to be manufactured by the **Wolfram Lampen Aktiengesellschaft of Augsburg, Germany.**

IT WAS FURTHER ORDERED that the Defendants deliver up to the **OSRAM LAMP WORKS, LTD.,** or destroy in the presence of their representatives, all such infringing lamps in their possession, and that an inquiry be held to ascertain what damages have been sustained by such infringement, and that the Defendants pay **THE OSRAM LAMP WORKS, LTD.,** their full costs, charges, and expenses in the action as between Solicitor and Client.

**WARNING! Dealers in and users of similar infringing lamps will be proceeded against.**

## LOCAL NOTES

**Aberdeen: Power Supply.**—The question of giving a supply of electricity for power purposes to the Broadford works has occupied a good deal of attention recently. The opposition has been directed to the point that it is not profitable to supply electricity at  $\frac{1}{2}$ d. per unit, as this is under actual works cost. The fallacy of this argument, of course, is well known in connection with power supply taken during non-peak load, and the Electricity Committee's proposal to supply up to 100,000 units at ordinary power rates and  $\frac{1}{2}$ d. per unit for all consumption in excess of that on a contract for five years, has been passed. It should be noted, however, that the voting was 15 to 14.

**Brixham: Vibration from Generating Plant.**—An action has been brought against the Brixham Gas Co. by a property owner close to the works in respect of vibration caused by some small generating sets at work on the Gas Company's premises. After a long hearing, Mr. Justice Neville, in the Chancery Division, has held that there is sufficient vibration to constitute actionable nuisance, and granted an injunction, allowing three months within which to make the necessary structural alterations.

**Chester: Water Power Works.**—In a report in which the City Electrical Engineer refers to the satisfactory working of the Dee water-power electricity works, reference is also made to a complaint by the Chester Boat Co., which runs a service of steamers on the Dee, that the operations of the power scheme have had the effect of reducing the depth of water available this winter to such an extent that there is every probability of the steamer service having to be suspended altogether next summer. A special sub-committee has been appointed to investigate the complaint.

**Hinckley: Electric Supply.**—An agreement has been come to between the Council and the Midland Electric Light & Power Co., Ltd., for the latter to apply for an electric lighting provisional order to be immediately transferred to the Leicestershire & Warwickshire Electric Power Co., which has a power station close to Hinckley. Supply will, of course, be immediately available, and under the order the Council has the right to acquire the undertaking in its district at the end of forty-two years. The Council has been advised in the matter by Messrs. Preece, Cardew & Snell, who express the opinion that a municipal undertaking could not be made a financial success now.

**Newport (Mon.): New Generating Set.**—The new 3,000-kw. 6,000-volt A.E.G. turbo-alternator was officially started up last week. A wet air filter has been installed in conjunction with this set.

**Northampton: Reduction in Cooking and Heating Charges.**—The Northampton Electric Light Co. has reduced its charge for electricity for heating and cooking purposes from  $1\frac{1}{2}$ d. to 1d. per unit. It is stated that this reduction has been made owing to the rapid increased demand for current for these purposes, whilst many of the boot manufacturers in the town are now using electric irons, pressers and stamping machines.

**Spain: International Exhibition.**—With reference to the International Exhibition which it is proposed to hold in Barcelona in 1915, as announced on another page, a document

to hand from the British Chamber of Commerce for Spain anticipates a great boom in electrical matters during the next two years. Important companies, both national and foreign, are now engaged in erecting water-power stations at the water-falls of the Pyrenees and various provinces, and it is anticipated that by the end of 1915 something like 300,000 h.p. will be available for transmission to Barcelona, and will be sold at very low rates. The Chamber of Commerce, in order to encourage interest in Great Britain in the 1915 Exhibition, has sent a deputation to England. Already the municipality and other local organisations in Barcelona have guaranteed important subsidies, that of the Town Council amounting to 10,000,000 fr. British manufacturers are urged to take interest in this Exhibition, as the Chamber of Commerce is assured that it will open an excellent market in Spain.

**Walsall: Increase in Power Charges.**—The Electricity Committee's recommendation to increase the price of current for power purposes next year by 10 per cent. has been adopted by the Corporation. The somewhat unusual comment is made in the Electricity Committee's report on the general question of developing the undertaking that although the use of electricity would be popularised by hiring motors, cookers, &c., the Committee could not recommend the expense involved.

## MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

**Bankruptcies.**—The application for the discharge of J. G. Hilton, Electrical Engineer, 103 Exchange Buildings, Birmingham, will be held on January 15th, 1914, at the Court House, Corporation Street, Birmingham.

Charles Blake, trading as the Bilston Electrical Co., 4 Church Street, Bilston, has been adjudicated a bankrupt.

**Liquidations.**—The statement of affairs in the liquidation of Prested Miners' Gas Indicating Electric Lamp Co., Ltd., shows a deficiency of £18,876. The failure of the Company is attributed to the fact that the lamp was too expensive to be made commercially profitable.

**Christmas Holidays.**—A. Reyrolle & Co., Ltd. (Hebburn-on-Tyne), notify that their works will be closed from Wednesday, Dec. 24th, to Friday, Jan. 2nd, and that the offices will be closed for part of that time.

The Edison & Swan United Electric Light Co., Ltd., will open their premises as usual at College Hill and Queen Street, E.C., on Saturday, the 27th, for the convenience of their customers.

**Companies Struck off the Register.**—The names of the following will be struck off the register of joint stock companies at the end of three months, unless cause is shown to the contrary:—Electricity Generating Co.; Ferabin Lamp and Electrical Accessories, Ltd.

## NEW COMPANIES

**BRITISH ARC WELDING CO. (BRISTOL CHANNEL), 2**

Official Advertisements are charged at the rate of 9d. per line (column width).

Small Prepaid Advertisements of Situations Vacant and Wanted, Plant for Sale or Wanted, &c., are inserted at the rate of 1/- for the first 12 words and 1d. per word afterwards. Three insertions for the price of two. Advertisements can be received up till Wednesday morning first post.

Letters should be addressed to THE KILOWATT PUBLISHING CO., LTD., 203-6, Temple Chambers, London, E.C.

### TENDERS INVITED.

#### COUNTY OF LONDON.

The LONDON COUNTY COUNCIL invites TENDERS for AN ELECTRICAL INSTALLATION at the POPHAM ROAD ELEMENTARY SCHOOL, S. ISLINGTON, comprising about 130 lighting points.

Persons desiring to submit Tenders may, on and after *Monday, 22nd December, 1913*, obtain the specification, form of tender, &c., on application to the Chief Engineer of the Council, Mr. G. W. HUMPHREYS, at the County Hall, Spring Gardens, S.W., upon payment to the Cashier of the Council of the sum of £1. This amount will be returnable only if the tenderer shall have sent in a *bona-fide* tender, and shall not have withdrawn the same. Full particulars of the work may be obtained on personal application, and the drawings, specification, and other contract documents may be inspected at the County Hall before the payment of the fee.

The Contractor will be bound to pay to all workmen employed by him in and about the execution of the contract or any part thereof, wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule. Particulars of the Council's Standing Orders on these matters are given in the *London County Council Gazette*. Tenders must be upon the official forms and the instructions therein must be strictly complied with. No tender received after 11 a.m. on *Tuesday, 13th January, 1914*, will be considered.

The Council does not bind itself to accept the lowest or any tender, and it will not accept the tender of any person or firm who has withdrawn a tender after the same had been opened, unless the reasons for withdrawal were satisfactory to the Council.

LAURENCE GOMME,

*Clerk of the London County Council.*

County Hall, Spring Gardens, S.W.,  
15th December, 1913.

### APPOINTMENTS VACANT & WANTED.

SWITCHBOARD ATTENDANTS wanted for the L.C.C. Tramways Sub-stations. Shift Duties. Wages, 30s., rising to 40s. a week. Applicants must have practical knowledge of switchboard operation, and be not less than 22 years of age. Apply to the CHIEF OFFICER, L.C.C. TRAMWAYS, 62 Finsbury Pavement, E.C.

TRAVELLER—Retail electrical experience, desires post. Wholesale preferred. Interviewing or Supervision. Apply "AMPS," 6 Alma Terrace, Torquay.

SOUTH KENSINGTON, LONDON, S.W.

The following Advanced Course of Instruction will be given, commencing in January next:—

City and Guilds (Engineering) College.

Subject— Conducted by—

Railway Engineering (including):

Railway Signalling	Mr. H. G. BROWN, M.I.E.E.
Railway Organization	Mr. W. T. STEPHENSON, B.A.
Electric Traction and Railway Electrification	Mr. P. DAWSON, M.Inst.C.E., M.I.M.E., M.I.E.E.

For further information of this and other courses to follow, application should be made to THE REGISTRAR.

**John E. Raworth,**

Queen Anne's Chambers, Chartered Patent Agent  
30, Broadway, Westminster, London, S.W.

### FOR SALE AND WANTED.

DUST SHEETS to cover Electrical Machinery, 12 feet square, 8s. 6d.—and made to any size. Best washed meat cloths, 28lb. bag, 13s. 6d. Large Chamois Leathers, 10s. 9d. doz. Chamois Cloth Dusters, 2s. 9d. doz. Swabs, 1s. 3d. doz. Try samples. WILLIAM MOORE, Lauderdale Buildings, Aldersgate, London.

CABLE CASINGS to compete against any Manufacturers in the World, trade discount on application. Creosoted troughing and timber for underground work, also woodwork of all descriptions. Send 1s. 6d. (export 3d. extra) for the most up-to-date illustrated list (264 pages) of woodwork and timber in the World, to include 4-fold, brass-jointed boxwood rule. Will return money in exchange if not worth 2s. 6d. to you. JENNINGS & Co., 955 Pennywell Road, Bristol.

GAS RETORT CARBON for sale. Pitch, Insulating Material, Carbon Electrodes. We supply the trade. V. DASHKES, 21 Water Lane, E.C.

PLATINUM UTENSILS, SCRAP, LAMP TOPS.—Best prices given by DERBY AND Co., LTD., 44 Clerkenwell Road, London, E.C. N.B.—Platinum Sold.

PLATINUM, OLD ELECTRIC LAMP TOPS, Scrap Platinum purchased for cash. Best price given.—S. W. PRICE & Co., Platinum Refiners, 13 Great Queen Street, Kingsway, London, W.C.

### ANNOUNCEMENTS RELATING TO PATENTS.

The Owner of Patents Nos. 24,696/10 relating to "Improvements in apparatus for the production, strengthening, and reception of ELECTRICAL VIBRATIONS," and 13,968/11 relating to "Improvements in ELECTRIC CAPACITIVE-INDUCTIVE COUPLINGS," is desirous of negotiating with interested parties for the granting of licenses thereunder on reasonable terms. For information apply to MESSRS. LLOYD WISE & Co., Chartered Patent Agents & Consulting Engineers, No. 10 New Court, Lincoln's Inn, London, W.C.

**REMOVAL.** Mr. J. G. LORRAIN, M.I.E.E., M.I.Mech.E., Chartered Patent Agent, has removed his office from Norfolk House, Norfolk Street, Strand, W.C., to

(Incorporated).

Inquiries cordially invited by the Secretary,

L. G. TATE,  
20, Bucklersbury, LONDON, E.C.

When corresponding with Advertisers, please mention "Electrical Engineering."

# "SYNCHRON" THE LIFE-SAVER

**The latest invention for restoring animation after apparent death from Electric Shock, Drowning, Mine Gas Poisoning, etc.**  
**A boy can use it, no technical knowledge necessary.**

*The Star, Nov. 28th, says:—*

"Electric shocks need not necessarily prove fatal, and people who have been victims of a shock appear to be like people who have been immersed in a pond; both may be revived by means of artificial respiration.

"Some very interesting information regarding this is given in the 'Lancet' by Dr. Reginald Morton, President of the Section of Electro-Therapeutics in the Royal Society of Medicine, who states that practically no shock, however severe, need necessarily prove fatal.

"Death from electrical shock is only an apparent death at first, and whatever the conditions or severity of the accident, there is practically always a time, varying from a few minutes upwards, during which it is possible to resuscitate the victim by artificial respiration if resorted to at once.

"So important is it to commence artificial respiration quickly, that it is the first duty of the bystander to see to this before everything else."

**YOU CAN DO THIS WITH THE SYNCHRON**  
**it is always ready.**
